The Survey, therefore. sugg that in order to achievehigh ove growth sates, the rates of growtl agriculture should increase su tantially To achieve this, it necessary to have both more inv ment and better implementation chinery An increase in agricult investment means primarily an rease in investment in irrigat This is of the highest priority c sidering that water is the most portant input and that only ab 25 per cent of the total area c vated is irrigated at present It involve a strategy for a proper of both surface and ground w resources as well as consider improvement in water managem Simultaneously steps will have to taken to improve the input of rese as also other inputs such as be seed, fertilisers, pesticides, impro implements, credit etc. This re res a great improvement in the duction and organisation of t supplies as well as in the inf

ONOMY IN 1976-77

ricultural Production Declined

RVEY 1976-77

ucture such as electricity, roads, narketing facilities etc

The Survey points out that such growth of agriculture is necessary ven for higher industrial growth ince the more important industries re agro-based, an increase in agricultural production will solve their aw material problems Since the ulk of the population depends p on agriculture, an increase in its rosperity means a larger market r industry and, therefore, justification for further xpansion

Price stability is important for teady growth Since the factors hich were operative in 1976-77 till continue in 1977-78, there is eed for great vigilance on the price ront Not only should credit policy mphasise restraint but there should e greater fiscal discipline. The arger volume of investment needed hould be financed from resources nobilised from the public but a arger proportion of such resources hould go into saving rather than n public consumption Simultaneously, effort should be put into larger mobilisation of resources hrough an imaginative tax policy. As the Jha Committee is looking nto indirect tax reform, the question f direct tax reform needs to be xamined as well.

Simultaneously the stocks with Government should be deployed whenever needed and imports should e effected flexibly. The twin instruments of buffer stocks and foreign xchange reserves should be used nost effectively for this purpose Advance information about domestic production prospects and advance planning of imports are absolutely essential

The need to pursue the current export strategy is obvious. The manoeuvrability which foreign exchange reserves have given us should be retained through a vigorous export drive, though this need not extend to commodities for domestic essential consumption India has the necessary capability and expertise and the experience gained so far should be put to the maximum benefit

The Survey observes that unemployment is India's most serious problem It cannot be solved without a high rate of growth of the economy. To achieve it, more resources for investment have to be raised through a flexible fiscal policy and more public saving has to be generated through a control of public consumption. This is in addition to measures which need to be taken to increase individual savings Public savings can be stepped up substantially through higher productivity, better management and appropriate price policies for public sector projects

Secondly, investment will have to be definitely more employment oriented. More investment has to be undertaken in sectors like agriculture, irrigation, village industries, small scale industries and a more extensive search has to be undertaken for an appropriate technology. Also these have to be organised far more efficiently if resources are not to be wasted.

A great deal of constitutional reform is necessary if these vital changes are to be brought about satisfactorily Land reform needs to be implemented effectively The process of planning and implementation should have greater involvement of the people if productivity and resource mobilisation are to improve Finally the organisational underpinning of extension, research, supply of inputs and marketing has to improve very greatly.

GNP, Savings and Investment

After achieving a record rate of growth of 8 5 per cent in real terms in the gross national product in 1975-76, the Survey estimates that the growth in gnp would be only between 1 5 and 2.0 per cent in 1976-77. The fall in agricultural production by 5 to 6 per cent in 1976-77 primarily accounts for the decline in the growth rate It observes that gross domestic savings in 1975-76 was 19.4 per cent of the gnp at market prices as compared to 17.5 per cent in 1974-75. Domestic capital formation also increased from 19.1 per cent as a proportion of gnp in 1974-75 to 20.8 per cent in 1975-76. The estimate for 1976-77 is that both domestic savings and capital formation as a proportion of gnp will be more or less the same as in 1975-76.

Agricultural Situation

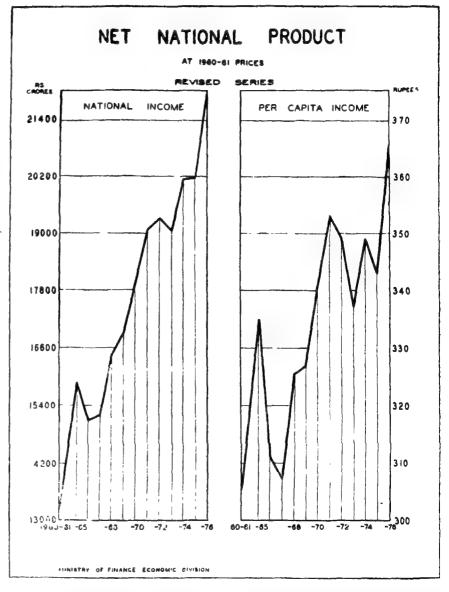
Discussing the outturn of agricultural output for 1976-77 the Survey estimates that the total food-

grain output would be around 111 million tonnes compared to 120.8 million tonnes in 1975-76. While the output of jute and mesta and sugarcane is expected to show an increase, production of oilseeds is estimated to be very much lower than in 1975-76 The output of cotton also is estimated to be no better. Overall, it is estimated that the index of agricultural production would show a decline of 5-6 per cent in 1976-77 compared to 1975-76

The Survey draws attention to the fact that Indian agriculture is still conditioned by the weather factor and will continue to do so for quite some time It also points out that the rate of growth of agricultural production in the seventies so far has been less than in the sixties High priority should be given to bringing more land under irrigation and to giving particular attention to water management if productivity in agriculture is to increase. More resources have to be made available for irrigation, a plan should be drawn up for conjunctive use of surface and groundwater resources and arrangements will have to be made for optimal use of water available, including institutional reform Simultaneously, the supply of inputs such as HYV seed, fertilisers, pesticides, better technology and credit needs to be improved considerably

While commending the improvement in credit facilities to the agricultural sector in recent years, the Survey draws attention to the fact that even with this progress only about a third of the credit needs of the agricultural sector are now met by cooperatives and other credit organisations Therefore, a further extension of credit facilities is inevitable.

It also suggests that a rural employment generation policy should form part of a local area development strategy This should include the development of agriculture and animal husbandry, the development of infrastructure, better utilisation of conventional waste materials, farm forestry, etc

The industrial production index has shown a steady growth in the last three years. From 2 8 per cent in 1974-75 it rose to 6 1 per cent in 1975-76 and 10 per cent in 1976-77 The Survey points out that whereas the recovery in industrial production in 1975-76 was mainly in the fields of electricity, coal metallurgical and chemical and allied industries, in 1976-77 manufacturing was the major growth sector Within this group large increases were registered by transport equipment, chemicals and products and basic metal industries Textiles, however, did not recover from their stagnation. The average weighted growth of the Central public sector undertakings (outside of NTC mills) was slightly over 11 per cent in 1976-77 in industries like steel, fertilisers and dry core cables Much of this improvement was due to better capacity utilisation industrial investment undoubtedly there was no great upsurge. There was not much of a revival in construction; and new investment was largely in the form of expansions and additions The emergence of a buyer's market also seems to have led to a cautious attitude Sickness in industry, though not wide-spread, has been a matter of concern for some time, particularly in industries like cotton textiles and jute. Since take


The rate of growth of production in the small scale sector is estimated to be appreciably higher than that in the large scale sector However, the overall rate of capacity utilisation in this sector was only of the order of 50 per cent

The Survey continues that without a step-up in investment it would not be possible to sustain the rate of industrial growth achieved in 1976-77 While there was some increase in over by Government is no longer the most efficient solution, other measures, have to be considered Besides through monitoring and an information system, it is necessary to prevent deterioration.

Employment in the organised sector increased by 5.20 lakhs or 2 6 per cent in 1975-76, due mainly to an increase of 4.7 lakhs in the public sector. The number of job seekers on the live registers of emp-

loyment exchanges in the country increased by 4.8 per cent to 9.77 million at the end of December, 1976. This was, however, less than half the increase in 1975. The total number of educated unemployed also rose from 48 lakhs in 1975 to 51 lakhs in 1976. The employment situation continues to be grave and the provision of employment has to be a prominent objective of development.

Price Behaviour and Price Policy

The wholesale price index recorded an increase of 11 per cent in the first half of 1976-77 mainly due to an increase in the prices of food items and industrial raw materials Prices of gur, groundnuts and ground nut oil and raw cotton accounted for half of the total rise. In the latter half of 1976-77, the price increase was less than one per cent, but the prices of items like tea, pulses rose sharply. The erratic behaviour of the monsoon, the expectation of a lower groundnut crop and cotton crop and the increase in money supply were responsible for this price rise.

Government stocks during 1975-76 (November-October) at 9.05 million tonnes were over 2 million tonnes lower than in the preceding year because of large availability in open market. Imports against past commitments and in exceptionally large procurement led to stocks of foodgrains mounting to 18 million tonnes at the end of 1976-77.

The production of controlled cloth has been declining continuously and the obligation to produce controlled cloth was reduced from 800 million sq metres to 400 million sq. metres because of the financial difficulties experienced by many mills. Due to the rise in cotton prices even this became difficult So the ex-mill prices were raised by 35 per cent in order to cover costs better. The consumer, however, did not suffer because the Government gave an equivalent subsidy to the National Consumers Cooperative Federation. At the same time a part of the controlled cloth obligation was passed on to the handloom and powerloom sector A subsidy of Re. 1 per metre would be needed to work this scheme

The experience of 1976-77 shows and the States were 5.5 per cent higher at Rs. 19,860 crores in 1976-77. While the developmental outlays were higher by 4.4 per cent non-developmental outlays were 7.1 per cent. The gap of Rs 5034 crores was to be covered by domestic capital receipts and external assistance to the extent of 93 4 per cent and by short term borrowings to the extent of Rs. 332 crores

Development expenditure by State Governments rose by 7.5 per cent and the trend over the past three years indicates that the proportion of development to total expenditure is rising Current revenues are not rising fast both because of a decline in share of Central taxes and a lower growth of States' own revenues The receipts from non-tax revenues show a decline in 1976-77 because of the losses incurred by departmentally run State undertakings

Another disquieting trend observed in the State budgets in recent years has been that some of the States whose finances were hitherto viable are showing signs of deterioration. The problem of overdrafts by cer-

Foreign Exchange Reserves Hit New High

Price policy in 1976-77 has been guided by the need to keep prices under control. Administered prices were by and large not increased but at the same time procurement and support operations were strengthened in order to provide farmers sufficient incentive. To check the rise in edible oil prices substantial imports were made by the SIC and the compulsory usage by the vanaspati industry of imported oil was raised from 20 per cent to 75 per cent To control cotton prices a programme to import 14 lakh bales was drawn up by Cotton Corporation of India and liberal imports of artificial fibre were allowed A 10 per cent blending of artificial fibre was made compulsory. A subsidy of 20 per cent of the import price of cotton was given in order to neutralise higher prices abroad

The strengthening and extension of the public distribution of essential commodities continues to be one of the important elements of price policy. Although the coverage of public distribution of foodgrains and sugar has increased over the years, releases of foodgrains from that measures of price reduction have necessarily to be accompanied by improved distribution if the benefits thereof are to reach the common man The food buffer stock and large foreign exchange reserves are powerful tools to maintain price stability To use them effectively advance planning and administrative flexibility are needed. Our ability to control prices is also limited by the state of international prices Moreover, in regard to items like pulses, imports are not possible and therefore the ultimate solution to the problem is increased production at home.

Fiscal and Monetary Policy

Annual Plan outlay was stepped up by 31 3 per cent to Rs. 7852 crores in 1976-77 The outlay on the development of agriculture was raised by 35 per cent while that on industry and minerals by 33 per cent The emphasis was on the completion of ongoing projects to increase the availability of vital inputs and infrastructure facilities in the short run

Combined outlays of the Centre tain States has also again become a cause for concern

It is worth emphasising that during 1974-75 the States made commendable efforts at resource mobilisation However, most of the States have not made any serious attempt to tax relatively undertaxed sectors There is also a tendency among the States to slacken their efforts at additional resource mobilisation in anticipation of the appointment of a Finance Commission The concessions announced recently by several States with regard to profession tax, sales tax, property tax and land revenue have further compounded this problem. There is therefore an urgent need to consider how they can augment their resources and bring about a better equity elasticity in their tax structure.

The improvement in the financial results of Central Government commercial undertakings witnessed in 1974-75 was not maintained in 1975-76. With few exceptions, the working of the enterprises leaves much to be desired and financial return from the enterprises is still far from adequate. The railways

showed a promising improvement in their financial results in 1976-77. The working of the Department of Posts and Telegraphs, however, came under strain in the last few years. In regard to state enterprises, compared to electricity undertakings and irrigation works, the road transport undertakings of the States have not done too badly.

The increase in money supply by 17.1 per cent in 1976-77 when the rate of growth in national income showed a marked deceleration was a cause for concern. The most important factor responsible for the high growth of money supply in 1976-77 was the increase in foreign exchange assets of the banking sector. Credit to the commercial sector including credit for food procurement also contributed to the expansion. Net bank credit to Government was not an expansionary force. The growth in money supply was damped to an extent by the growth in bank deposits

Credit policy therefore continued to emphasise restraint, but a certain amount of flexibility was introduced to meet the requirements of increased economic activity. In the face of high deposit growth of the banks the lendable resources were curtailed by statutory and obligatory provisions. Still gross non-good credit recorded an increase of Rs 1667 crores in 1976-77 as against an increase of Rs 1140 crores in the previous year. Of this 47 per cent was in respect of priority sectors. Industry accounted for 46 per cent of the increase in non-food credit, of which 60 per cent was accounted for by core industries

The measures taken by the Reserve Bank have only partially succeeded in limiting the growth of money supply. Every effort has, therefore, to be made to contain monetary expansion in 1977-78, without, however, affecting production and growth

Foreign Trade Balance of Payments

During 1976-77 the favourable trends in India's external payments position continued. Exports increased by 23 2 per cent to Rs. 4980.6 crores in 1976-77 and imports declined by 6.8 per cent to Rs. 4908 2 crores and a trade surplus of Rs. 72.4 crores was recorded in contrast to a deficit of Rs 1222.4 crores in 1975-76. Net invisible receipts, particularly inward remittances, were buoyant. Foreign exchange reserves, therefore, rose by Rs 1371 3 crores in 1976-77 compared to an increase of Rs 881 2 crores in 1975-76. At the end of 1976-77, India's foreign exchange reserves stood at Rs 2863 crores. However, this result has been achieved partly at the cost of investment for growth, according to the Survey.

The increase in inflow of remittances through banking channels seems to have been due to factors such as the large increase in the number of Indians working abroad, the checking of smuggling, the narrowing down of the gap between internal and external prices of gold and the improvements in the strength of the rupee.

The decline in imports in 1976-77 was essentially due to a marked reduction in the imports of food and fertilisers partly offset by increases in the value of the imports of raw cotton, vegetable oils and fats etc. The growth in exports was on account of iron and steel, engineering goods, cotton fabrics and apparel, leather, fish, tea, iron ore, oil cakes etc. On the other hand, exports of sugar and jute manufactures suffered a sharp decline

The gross inflow of external assistance increased from 1973-74 to 1975-76 after touching its lowest level in 1972-73. In 1976-77, it declined again to Rs. 1747 crores from Rs 1839 crores in the previous year Similarly, the inflow of external assistance net of debt servicing declined from Rs 1153 crores in 1975-76 to Rs 986 croresin 1976-77 Of late there has been some further improvement in the quality of assistance provided by some of the donor countries, e g U K, Federal Republic of Germany, Netherlands, Sweden, Norway, Denmark and Canada □

Panchayati Raj

(*Contd from page* 17)

development and block development plans could be meaningfully woven into the framework of rural district development plans so that there is planning from below There is need for both vertical and horizontal coordination of integrated rural community development and area development plans at the same and different levels The formulation of integrated rural community development and area development plans for each district should be the main responsibility of the Board which collects information on the real needs and problems of the rural people, the existing programmes, schemes, projects etc. and prepares future programmes In other words, the Board has to provide technical personnel in the fields of development and welfare programmes at the disposal of P R bodies They have to provide legal, administrative, technical and financial guidance whenever they called for In short, the Board is a mini-national planning commission at the district level Besides, the Board would provide continuous consultancy services of its development and welfare personnel and planning aids such as compilation of information, questionnaire for conducting evaluation studies and socio-economic surveys, models of plans, programme, projects, schemes etc. But the final responsibility for the approval of rural development and welfare programmes would rest with the non-officials of panchayati raj bodies After the approval of the development programmes, panchayati raj bodies should undertake the responsibility of implementation of development and welfare programmes within the rural district. The aim is to secure maximum community participation in plan formulation and plan implementation in order to ensure mobilisation of financial resources required for implementation of the programmes All these measures would go a long way in making the Panchayati raj bodies responsible for rural district planning and development and also the integrated rural community development and area development planning a reality. □

Yojana Quiz

1. In the year 1500 AD who declared himself as "Lord of the Conquest, navigation and commerce of India, Ethiopia, Arabia and Persia"?
2. What are the Horse Latitudes?
3. What is a Peppercorn Rent?
4. What does Habeas Corpus mean?
5. Why is it easier to roll a barrel than to pull it along the road?
6. Who are the founders of
   (i) Jainism
   (ii) The Parsi religion
   (iii) Taoism
7. Where are the following Public Sector undertakings:
   (a) Bharat Heavy Plate and Vessels Ltd.
   (b) Bharat Opthalmic Glass Ltd
   (c) Hindustan Copper Ltd
   (d) Cotton Corporation of India
   (e) Hindustan Cables Ltd.
8. What are the games associated with
   (a) Tee
   (b) Pot
   (c) Love all
   (d) Chukkar
9. Who won the Battle of Talikota?
10. Why a petrol fire cannot be extinguished by pouring water over it?
11. A glass tumbler is filled to the brim with water and a piece of ice is floating on it. As the ice melts, will the water overflow or not?

ANSWERS

1 King Emanuel of Portugal

2 Regions of calm in the Atlantic, are so called, it is said, because in the old days of sailing-ships, vessels were often becalmed here, and had to throw overboard any horses they were carrying because the fresh water on board was almost finished.

3 A peppercorn rent is the name given to a rent so small as to be merely nominal, intended not to bring profit to the owner, but simply to show the tenants recognition of the fact that he is a tenant and not the owner.

4 Habeas Corpus is the Latin for "Produce the body". This clause makes it unlawful for anyone to be held, a prisoner except on a charge for which he has been or is about to be tried. If he is so held, an application can be made to the High Court of Justice for an order, requiring him to be brought before the court, for a discussion as to the legality of his detention This had been set up mainly to safeguard against tyrany of the Government

5 The rolling force of friction is less than the dynamic force of friction. Hence it is easier to roll a barrel than to pull it along

6. (i) Mahavira
   (ii) Zoraster
   (iii) Lao-tzu

7 (a) Visakhapatnam
  (b) Durgapur
  (c) Calcutta
  (d) New Delhi
  (e) Rupnarainpur

8 (a) Golf
  (b) Billiards
  (c) Badminton
  (d) Polo

9. The combined armies of Bahmani Sultans of Deccan defeated the forces of Vijaynagar at Talikota in 1965 AD The defeat sealed the fortunes of the Vijaynagar kingdom.

10. Water being heavier, slips down and petrol will rise to the surface and continue to burn as before. Hence water cannot be used for extinguishing petrol fire

11 The level of water in the glass tumbler will remain unchanged. According to Archimede's principle, the weight of floating ice is equal to the weight of the water displaced by it Thus the volume of the water obtained by the melting of ice is exactly equal to the volume of the displaced water.

Contd. from page 23)

According to Samachar, May 20, 977, it has been proposed to start a cheme on integrated soil and water onservation for important Himılayan river catchments in Himachal ›radesh, West Bengal and Sikkim

A provision of Rs. 20 million ıas been suggested on the basis of 0 per cent loan and 50 per cent grant or the year 1977-78

The scheme is characterised as nulti-disciplined comprising afforesıtion, pasture development, agriultural crops. In additional there vill be soil and water conversation neasures on agricultural fields.

The States will set up multiısciplinary authorities for the cathment area to look after planning ınd execution of the projects. These uthorities will be made responsible or coordinating and monitoring of vorks connected with the soil conervation agricultural and non-agriultural lands in selected river basins ı these Himalayan tracts.

Besides, the above measures ceraın other steps are also needed to ave the rapidly deteriorating ecoomy of the shifting cultivators, for xample pilot projects could be tarted to educate the tribals in etter methods of land husbandry and agriculture. The pilot projects can be a successful venture if (i) there are dedicated workers to motivate the change and (2) there is no uniform pattern for the country as a whole, and adequate care is taken of the environment of differences of different regions.

Following provisions have been made in the Fifth Five Year Plan to solve Jhum problems of North East area:

1. Land should be terraced in the villages and all infrastructural facilities should be provided for resettling the jhumias.
2. Plantations, for which this area is suitable, should be developed with the help of Jhumias as labour. These should be later handed over to them as identifiable blocks in the plantations as their own property. The Forest Corporation should have an over all control on these plantations.
3. Horticultural units should be developed on the same pattern as the plantation with an added advantage of fruit processing and preserving units.
4. Castor linked up with horticulture should be developed. A provision of Rs. 250 million has been made in the Fifth Plan for the various States to prevent jhum cultivation and to expedite proper development of this zone. The Forest Department will afforest the jhum areas thus saved on sharing basis for which agreement has been reached with the District Councils which control these areas.
5. Wastelands, panchayat lands and degraded forests in the undemarcated forests near populous areas should be earmarked for the mixed plantations programmes. These areas should be planted intensively with quick growing species of trees.
6. Lops and tops and shaving should not be left in the forests to become fire hazard. Instead they should be brought out to some depots near habitation. Such fuel should be supplied to the people living in the neighbouring villages at cost price. This will persuade these people not to fell trees illegally in the forests. It will also add to the supply of fuel wood to the people. □

erambur, Madras.

A detailed review of the plan ıtlay for 1977-78 was conducted y the Ministry of Railways and the linistry of Finance and, as a meaıre of economy, the plan outlay ıs been reduced by Rs. 21 crores ». from Rs. 501 crores to Rs. 480 'ores including provision of Rs. 10 crores for the Metropolitan Transport Projects. The working capital requirement of the Production Units in respect of export orders amounting to Rs. 2.80 crores has been retained. Thus, the total revised plan outlay as presented in the final budget amounts to Rs. 482.80 crores against the interim budget outlay of Rs. 503.80 crores. The reduction is mainly under Rolling Stock (Rs. 9.39 crores), Traffic facilities (Rs. 5 crores), Investment in Road Services (Rs 2 crores), ad Track Renewals, Bridge Works. Workshops, Signalling & Interlocking Works (Rs. 1 crore each). □

Books

Economic Policy and Administration

Poverty of Policy *by R.K. Paranjpe; Published by Somaiya Publications Pvt Ltd., 172, Dadar, Bombay-400014; Pages 387; Price Rs 85.*

POVERTY of Policy is a collection of essays on Economic Policy and Administration These essays were written and the book was planned before the emergency was declared These essays, therefore, have a relevance in interpreting the situation prevailing before the emergency and the author's observations are often thought provoking. In his essays the author has criticised several policy measures adopted by the Government of India. Among the criticism voiced by Dr. Paranjpe may be included lack of consistency, shortsightedness and adhocism resulting in drift in policy from one situation to another There is a lack f consistency in controls which have changed according to pressure of time rather than based on any long term plan or perspective. He also notes the wavering of Government's attitude towards the ICS, which he regards "as a white-elephant which the country could ill-afford."

He is critical of the hypocrisy of the Indian elite, who support policies largely benefitting the vested interests He also denounces the 'oral radicalism' which considers every extension of state control with socialism The author adopts controversial postures on various issues, which make the reading both absorbing and thought provoking

On the efficiency of public sector, he admits that the neglect of profits in the public sector in India had resulted in the past in mis-management and waste. On the implementation of MRTP Act he seeks to answer the critics but admits that there is much scope for improvement He, however, throughout makes special pleading for it, due to his association with the Commission.

A full section has been devoted to the problem of administrative changes and these include, inter-alia, the plan implementation, the political rights of public sector employees, administrative reforms and the controversy relating to the commitment of civil servants He is unhappy over the "proliferation of regulative instruments, which almost operate like tollgates, where funds can be collected by corrupt administration as well as political personnel. The demoralising effect on administrative function of acts such as the collection of political funds through "clandestine channels", and the "delays and indifference to the requirements of ordinary citizens".

His attitude and thinking towards political appointments is inconsistent At one place he condemns it on the ground that it can easily open the floodgate of nepotism. At another place he justifies political appointments by the Minister to assist him in his tasks

Considering as a whole, the main interest in these essays would seem to lie not in the originality of ideas but in the forthright manner in which they are often expressed. The author's provocative and challanging position on many issues make the reader to dissent vigorously and debate the points raised. The controversy raised on India's licensing policy in these pages would continue to be debated.

This is a readable book. Moreover, with the change in the Government, there is visible change in the thinking of the policy makers particularly in the field of economic policy formulation and administration The areas, where change is iminent, include the role of public and private sector, industrial licencing, plan priority and implementation, administration reform, etc. This volume, in addition to giving details of the pre-emergency policy framework, lays bare the shortcomings of the existing policy measures laid down in various acts/rules and regulations, and in the realm of implementation. It is a must for policy makers and administrators

—**Kamla Prasad**

Capital Management

Capital Budgeting in India *by L S. Porwal; Sultan Chand & Sons; Pages 95; Price 30*

THE BOOK under review is an empirical study of the organizational, qualitative, quantitative, behavioural and control aspects of capital budgeting in large private sector manufacturing companies in India. It includes a comparison of capital budgeting at home with the practice obtaining in the United States.

Divided into seven convenient chapters, the study begins with the objectives, scope, methodology and limitations. This is followed by an account of the studies made in India and England. The author, however, has not spelt out exactly what are the regulations in India and how they affect Indian industries.

Other chapters deal with the financial objectives, planning and organisation of capital investment proposals in large manufacturing companies. Techniques of economic evaluation of capital expenditure projects, sources of funds and techniques of economic justification and other aspects such as capital rationing, behavioural problems, project risk and control of capital expenditure research are some of the other topics covered in the book.

The author says that his study has revealed that there is a wide gap between the theory on capital budgeting and industry practice. He expresses the view that mere rule of thumb practices are most likely to lead the industry to misleading and unfair decisions. But if decisions are made after a thorough quantitative and qualitative analysis, then it would lead to better capital expenditure management and also help achieve higher profitability and growth.

The two year old figures given in the book about profit, growth and capital are of little practical value at present. The author could have added a chapter or two on the gains in the business field during the emergency, and made the study more meaningful and topical. Still the book may be useful to economists and students of management.

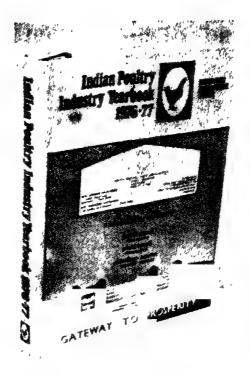
An Indispensable Year Book

Indian Poultry Industry Year Book 1976-77 *by J.N. Panda, D.N. Biswas, A P. Sachdhev, A William Jasper; Published by Mrs. S.P.* 34, *New Rohtak Road; New Delhi*-110005, *Pages* 424+*xxviii, Price Rs.* 50.00

DURING the last decade excellent progress has been made in the field of poultry keeping in this country. Of course, there have been ups and downs. Of late the importance of poultry keeping in the improvement of rural economy and as a means of self-employment is well recognised.

"India Poultry Industry Year Book"—1976-77" is the third edition. The first edition was brought out in 1972. This itself proves the utility and value of the publication for poultry keepers. The publisher needs to be congratulated for providing excellent service to the poultry keepers by updating and filling up the lacunae existing in the earlier editions.

The publication is dealt with in 5 sections. Section I is further divided into 5 chapters. In the first chapter, a general survey of the poultry industry has been made. Chapter II, "Statistics", gives valuable data on various aspects of poultry keeping. Chapter III deals with review of 9 topics, viz. Rural Development through Poultry Raising, Institutional Credit for Poultry, Financing Poultry Farmers, Prospects of Egg Exports, The Developing Broiler Industry, Duck Farming, Poultry Farmer and his Marketing Challenges, Nutritive Value of Egg, and Guide Taxation on Poultry. The next 2 Chapters on Management Practices and Poultry Diseases, as in the earlier edition, are very informative, but have been updated and dealt with in greater length.

In this section, the publisher, in future editions, may consider the inclusion of one review article on one aspect of poultry keeping e.g. breeding, feeding and diseases, based on research work conducted in the country in that field and indicating the existing lacunae, and future line of work. A chapter on preparation of feed by small farmers themselves with the available local feeds may be considered for inclusion in the publication


Sections II, III and IV 'Technic 'Directory' and 'Who's Who' very informative and have b updated.

A new feature of this editior the International Section This widened the scope of this publ tion. The publisher has given formation in brief about pou organizations and statistics on and broiler production. It wo have been better if the author l given detailed information ab poultry industries, their problems advances in the underdevelope countries in South-East Asia, Mid East and Africa.

This book of 424 pages is v well-produced. It has already come an indispensable item the shelves of all those interested poultry keeping, irrespective of fact whether they are actual poul keepers, students, research work or those working in poultry indus

R. R. Lokesh

Industrial Law

Elements of Industrial Law *by N. D. Kapoor ; Published by Sultan Chand & Sons; Pages* 155+*XIII; Price Rs* 10.

LITTLE about lot or lot about little are the two patterns in vogue today in the world of book-writing on any subject, particularly law. The book under-review obviously falls under the former category in as much as the author adopts the 'touch and go' approach in describing the various vital industrial laws. While The Factories act, 1948, The Industrial Disputes Act, 1947, The Workmen's Compensation Act, 1923, The Payment of Wages Act, 1936, The Minimum Wages Act, 1948, The Trade Unions Act, 1926 and the Employees' State Insurance Act form the first Part; The Industrial Employment (Standing Orders) Act, 1946, The Apprentices Act, 1961, The Collection of Statistics Act, 1953, the Employees' Provident Funds and Family Pension Act, 1952, The Payment of Bonus Act, 1965 and The Maternity Benefit Act, 1961 form the second Part of the publication.

At the end of the book is an Appendix of the latest Amendments i.e. amendments effected in the year 1976 vide the Industrial disputes (Amendment) Act, 1976, The Payment of Bonus (Amendment) Act, 1976,The Payment of Wages (Amendment) Act, 1976, The Employees' State Insurance (Amendment) Act, 1976 and the Workmen's Compensation (Amendment) Act, 1976. At the end of each Chapter, except the first one, are given the 'test questions', probably for the benefit of students preparing for various examinations Here and there, old case law is also cited as per the convenience of the author, rather than the call of the subject concerned.

Surprisingly, the second part of the book is titled as "Elements of Mercantile Law". Why so? Nowhere in the book one finds a reference which should have provoked this title. Besides, the absence of any mention about such Central laws as Contract Labour (Abolition and Regulation) Act and Payment of Gratuity Act is conspicuous in itself.

Nonetheless, the publication is likely to become popular amongst such 'students' who are on the lo kout for such publications and for whom it apparently is designed

Pawan Chaudhary

Development Notes

Fertilisers on Credit for Farmers

Chemical fertilisers will be supplied on credit to farmers in Jammu and Kashmir during the current kharif

The facility will not, however, be available to those who have defaulted in the repayment of fertiliser loans advanced to them during the last two years or to those who have such credit facilities available by virtue of being members of one or more cooperative institutions

The state government has adopted a target of distributing 19,200 tonnes of nitrogenous and about 5000 tonnes of non-nitrogenous fertilisers during the current kharif which, incidentally, is facing rough *weather condition on account* of persisting low temperature.

The state government has adopted a foodgrains production target of 11 60 lakh tonnes for the current year The major thrust will be in the area of rice production where a target of 5 50 lakh tonnes has been adopted Among other measures, 2 05 lakh hectares are proposed to be brought under the high-yielding varieties of paddy

The high-yielding variety of maize is proposed to be cultivated on 35,000 hectares The farmers have been given the option of repaying fertiliser loans in kind by the end of the current calendar year

CMFRI'S Fish Culture Project

The Central Marine Fisheries Research Institute, Ernakulam has taken up fish culture in one acre farm at Mulky, 35 km north of Mangalore as part of its programme for culture of Sillage Sihama fish

In a preliminary experiment, it was possible to produce about 300 kg per hectare in a period of five months Culture of "sand whiting" was initiated in 1973-74 and at the end of four months the average size attained was 20 cm weighing 80 kg in a small pond

Sand whiting is a food which has good export value It commands a high price throughout the year, particularly during the monsoon season. The flesh of the fish is used in various preparations of human consumption and its head is used as canine fish

The entire demand in the country which is increasing at present is met by indigenous production only from the estuarine catches throughout the year The estimated yearly catch at Mangalore is about 10 tonnes Its market price at Mangalore is about Rs 12 per kg

A pilot project on sand whiting culture has been suggested for the CMFRI The project envisages collection of fry and fingerlings from various estuaries, stocking these in specially constructed ponds, and staggering of stocking in order to ensure pre and post monsoon harvest The project will offer its culture by adopting scientific methods and offer self-employment for the coastal people It is proposed to construct about 15 *ponds in three hectares farm* in the coastal area where stocking of fingerlings will be at the rate of 30,000 per hectare twice a year to harvest crop estimated six tonnes

Walnuts Earn Foreign Exchange

Kashmir walnuts are coming up as an important foreign exchange earner Foreign exchange totalling Rs 3 45 crore was earned during the first nine months of the last financial year by the export of walnuts from the state i e Rs 28 lakh more than the total foreign exchange earned from this source during 1975-76.

The Central government has launched a scheme to promote the production of walnuts in the state under which 50 per cent subsidy is provided to growers on the cost of plant material and fencing

The area brought under walnut cultivation during the last four years is placed at over 5,500 acres, raising the total area under walnut trees in the state to over 30,000 acres. An additional area of 3,000 acres is being brought under walnut cultivation during the current year

Meanwhile, Kashmir is all set to export knock-down furniture to Gulf countries with the assistance of Commonwealth Fund for Technical Cooperation (CFTC) under which new designs and prototypes are being introduced at the government owned joinery mill at Pampore in the Kashmir Valley.

Biggest PVC Plant For Baroda

The Indian Petrochemicals Corporation Limited, a Government of India undertaking, will be setting up in its integrated complex in Baroda a large-sized polyvinyl chloride (PVC) plant with a capacity of 55,000 tonnes a year This will be the country's biggest PVC plant. The proposal was expected to be approved shortly and construction would be over in a few years time.

The IPCL's large-scale integrated complex for manufacture of three polymers—low density polyethylene, polypropylene, and polybutadiene rubber—was nearing completion.

On reaching full capacity, the Baroda complex will make available 50,000 tonnes of low density polyethylene in collaboration with AED Chimie of France, 50,000 tonnes of polypropylene in collaboration with Monti Edison of Italy among many other chemical, rubber and fibre intermediate products.

IDA Credit For MP

Agricultural extension and research in Madhya Pradesh will be strengthened with a $10-million (approximately Rs. 9 crores) credit from the International Development Association (IDA), an affiliate of the World Bank

The $ 20 9-million (about Rs 18 8 crores) project is directed towards achieving, in the short term sustained growth in agricultural output, particularly foodgrains in 15 of the 45 administrative districts of Madhya Pradesh covering about seven million hectares of cropped land

The project will emphasize the consolidation and strengthening of the State's agricultural extension services and help reorient adaptive agricultural research to provide farmers, on a regular systematic basis, with advance on farming practices having an immediate impact on yields The project will be executed over a five-year period

The IDA credit to India is for a term of 50 years, including 10 years' grace and is also interest free

Textile Machinery For Tanzania

The Textile Machinery Manufacturers' Association and the National Textile Corporation of Tanzania (Texco) have finalised an agreement for the supply of machinery and technical services from India on a turn-key basis The deal will fetch Rs 8 5 crores to India.

The agreement provides for the establishment of a turn-key cotton spinning mill complex valued at over Rs. 10 crore. The special feature of this order is that the consortium of Indian textile machinery exporters will be aided by a consortium of Indian banks under the leadership of the IDBI.

The spinning plant will have a capacity of 33,900 spindles and will produce 1 8 million kg of combed 40s (half of which doubled) and 1 2 million kg of 20s carded per annum. The mill would be fully air-conditioned with complete plant and equipment for electrification being supplied also from India.

Tractor-Mounted Reaper Binder

A tractor-mounted reaper binder with 100 per cent indigenous components has been developed by a research engineer of the Punjab Agricultural University.

While the threshing process is wholly mechanised in the Punjab, the cutting of the wheat crop is mostly done manually This delays cutting because in spite of a huge influx of agricultural workers from Bihar and U.P shortage of labour during harvesting season continues. The entirely indigenous reaper developed by the PAU is operated with a 30 hp. tractor On an average it can reap 0.5 to 0 6 acre per hour The binder needs two persons for its operation including the tractor driver Its estimated cost is Rs. 10,000.

At present there are 400 combines, tractor propelled or self-propelled, working in the Punjab But these machines can hardly harvest two per cent of the crop. Moreover with these combines, the farmers cannot get *bhusha* which they need throughout the year for their cattle.

The new reaper binder makes *bhusha* also available in the same way as through manual cutting.

DESIGN OF DAMS

A Status of India's Self Sufficiency

Y. K. MURTHY

DEVELOPMENT of water resources and water conservation techniques dates back to the period when civilization perhaps itself begins Even before independence, India was placed in a position of eminence in the field of irrigation development by its achievements in design and construction of various types of hydraulic structures. An outstanding example of an early successful attempt of harnessing the rivers for irrigation is the Grand Anicut across the Cauvery built in second century A.D

Construction of dams for creating storage reservoirs is an important development activity pursued all over the world The building of dams is as old as recorded history of mankind Traces of ancient dams bear witness to the achievements of civilization which have long passed off

Storage structures on rivers began coming into being in India, with the construction of the 60 m high Khadakwasla dam in 1869-1879 and and 53 m high Periyar Dam, completed in 1887. Understandably enough the early storage structures are located in the Central and Southern parts of the country, the reason is that the rivers there are not perennial and, therefore, there is need for storage and regulated utilisation, also the foundation of the structures are near ideal

Irrigation projects completed till Independence catered to an area of only 10 million hectares The installed hydro-power in 1947 stood at 2 3 MKW After the advent of Independence in 1947, water resources utilisation was accepted as one of the essential requirements for the overall economic development of the country. It found its useful place in the nation's economy and got a fuller orientation.

The post-Independence period developed irrigation potential to 30 4 m hectares and increased hydropower potential to 8.44 million KW till 1975-76. Three fourths of the water resources utilization projects constructed during this period are based on storage. One hundred fifty masonry concrete dams and three hundred seventy earth/rockfill dams were taken up and many were completed in this period.

In the field of masonry/concrete dams, some of the major achievements made during the period include the design and construction of Bhakra (H P.), Tungabhandra (Karnataka), Rihand (U P.), Nagarjunasagar (A P), Koyna (Maharashtra) and many others. As regards earth/rockfill dams, Hirakud (Orissa) Gangapur and Girna (Maharashtra, Ramganga (U P), Beas (H P), and many other stand as monuments of development

Rapid advances in the field of soil and rock mechanics and evolution of heavy equipments to handle large volumes of concrete/earth work have inspired the construction of dams to heights and also on sites which would have been considered impossible earlier. The stage of dependence where consultancy of western experts was sought has practically vanished and a sense of self-confidence and self-reliance has taken place amongst the engineers of the country India today ranks third in the world among countries having the maximum number of dams While the construction methods and its improvements in the designs techniques are in many cases unique and rewarding, the shapes of Indian dams may not offer a large variety The country has moved forward on the traditional base, introduced modernisation in its construction techniques, and yet retained a synthetic balance between social values and economic growth

Development in Designs

Safety and economy are the principal elements in the design and construction of dams. As related to other considerations, such as selection of sites, competency of suitability of materials, hydraulic or energy capacities or operation safety and economy are the controlling factors. Other factors, although important are secondary in the design and building of a dam.

Having satisfied safety criteria, problems of economy are closely associated with benefits, operation and maintenance. Design adjustments in the dam site, accessibility, simplicity and magnitude of the dam, as well as capacities and fractional operation of facilities all tending to obtain the least cost for the greatest benefits--form the basic complex process in the economical design and construction of dams

Masonry/Concrete Dams

Earlier dams were designed with triangular profile and no provision was made for the release of uplift as is seen in the Walwham Dam (1916), Shivwatu Dam (1920) and Mulshi Dam (1929) of Maharashtra. The provision of drainage in the foundations and the body of the dam to reduce uplift pressures were provided in the Indian dams only after 1920, when similar provisions were attempted in structures abroad. The very early dams had near ideal foundation conditions, their design did not take into account any uplift forces, nor had they any special foundation treatment or provision of drainage system Consequently, the profiles of such dams were slender compared to modern gravity dams

Continuous research, though, instrumentation and observation and confidence borne out of experience, keep pushing the frontiers of knowledge Observations on uplift in a number of dams where the means for its measurements were incorporated its existence. Hence, the concept of safety dictates that a reasonable allowance be made against uplicft forces. The earlier dams were designed by keeping the resultant within the middle third, which was known as 'Middle Third Rule'. The formulae and practices for calculating the stresses in the interior of gravity dam, based on the methods developed by U S B R was adjusted in the Indian designs much later. Then developments and advance in the technique of dam designs helped in proper zoning of material in the am.

Safety against sliding is an important requirement in the design of dams Dams which have excellent

---

Shri Murthy is Chairman Central Water Commission.

foundation conditions do not present any such problems.

With the mounting economic pressure for executing dams for the utilisation of water resources on rather an as-is-where-is basis, sites now have thin foundation suitably treated Excellent sites for dam construction getting almost exhausted, we come across dam sites where we encounter with numerous foundation problems. A thorough knowledge of these problems and foundation weaknesses are necessary for a safe design The criteria for checking the safety of the dams against sliding by sliding factor have now given way to the criteria of adequate shear friction factor of safety Some of the dams being built in India like Srisailam Dam, Kadana Dam, Kallada, Barna, Iddiki and Ranapratapsagar (to mention a few) had very complex foundation problems with innumerable faults and shear zones where sliding resistance of the dam was an important factor to be considered in the design of the dam Remedial measures such as having concrete drifts intercepting the weak zones below the foundation thrust blocks immediately downstream of the dam and use of post tensioned cables were adopted.

The trial load method of analysis for the first time was applied to the designs of Bhakra Dam and recently to the Idikki Arch Dam The availability of electronic computers has enabled application of finite element technique to special problems encountered currently This method has been employed in determining the stresses in the foundation of Salal Dam, where complex geological conditions exist, in analysing the stresses to determine the problems causes of cracks in the konar and Hirakud Dams The awareness and knowledge of new tools has come to stay and there is a wider appreciation of the need for more elaborate, thorough and detailed theoretical analysis.

The earthquake in Koyna paved the way for study of seismicity in relation to storage reservoirs and created a new awareness for a seismic design involving hydro dynamic analysis.

Fundamentally the problems of earthquake design reduce to those of the design against lateral forces which result from the acceleration of the structural mass. For dams above 100 m high, the response spectrum method is used for the design of the dam. One of the major problems is that of selection of the value of seismic co-efficient to be used for design purposes. The value of seismic co-efficient to be adopted in the design of various river valley projects are now recommended by a Committee of Experts consisting of seismologists, earthquake engineering specialists, engineering geologists and dam design engineers. The seismic co-efficient is evaluated by taking into consideration various geolectonic factors, incidence of earthquake, type of dam and the dam site geology

There has been a growing feeling that the pseudo static approach which in essence is a static analysis is not logical as the force induced is a dynamic one In case of Salal Dam (J&K), in view of the location in a complex geological foundation and a highly seismic environment, a detailed study of responce of the structure has been carried out by analytical and mathematical methods. By those studies, the damage potential by way of deformation that the structures undergo has been evaluated and taken into consideration in finalising the design

The Himalayan geology with its complex tectonics, faults and fractures has been posing new design problem in Northern India. Sediment rock formation in Rajasthan, Madhya Pradesh, Gujarat and elsewhere in the country with inter layered weak planes, faults and shears present varied problems of stability The science of rock mechanics and its application to dam engineering has assumed an eminent place in the present day design.

Salal Dam, Jakham Dam, Kadana Dam are some of the few examples where extensive foundation studies and design analysis have been carried out backed by extensive in situ field tests

The objectives to be achieved in the treatment of the foundation of a concrete dam are water tightness, deformability and stability Compared to soils, anistrophy in rock is more complex because of the many directions of the joint/fissures etc and varying permeasibility. Extensive grouting of the foundation to block out possible channels of seepage is also attempted All rocks are not necessarily groutable to the required degree with conventional cement grout mix. The pressures, the stages of grouting, the spacing of grout holes, type and ratio of grout mixes offer scope for continued research backed by field experiences Reversible and irreversible deformation occurs in rocks. Stability of dam pre-supposes that the deformation is equal over the entire contact surface. There are some cases where rock width may not be adequate for the dam base to sit fully. In such cases, the design techniques are backed by photoelastic model tests.

Material technology also have advanced considerably. Earlier we had masonry dams like Bhandardara Dam, Krishna Raja Sagar Dams built in masonry with hydraulic line mortar. Benefits and availability of new types of cement, admixtures, changes in methods of selection and grading of aggregates, new practices in proportioning, mixing, placing and curing of mass concrete in dams of Western countries had a considerable and significant influance on concrete and mortar design mixes for masonry dams in India

Stone masonry in the world's highest masonry dam at Nagarjunasagar, Ruble concrete in Koyna, colcrete in coffer dams of Srisailam are some examples of new grounds in art of dam construction

There are number of major achievements in the field of dams in the post Independence era. They stand as proud symbols of the studies the country has made The country has moved forward, introduced modernisation in design and construction techniques

Advances in soil mechanics and general earth work engineering during the last fifty years together with developments in hydro geology have inspired the construction of earth and rockfill dams to heights and on sites which would have been considered impossible by earlier generation of engineers Further more, the great strides in recent years in the evolution of specialised earthmoving equipments have often made construction of such dams highly economic. Growing confidence in analysis and technique improvements in earth excavation, hauling plants and rapid reduction in the number of sites suitable for construction of gravity dams necessitate progress in the construction of major earth rockfill dams to continne unabated

As time advanced, changes and requirements in the methods of investigations, testing , design and construction have been taking places Accordingly, the design methods are modified keeping a constant tough with the changes taking place from time to time.

Some of the most important problems of earth and rockfill dam designs are e.g. selection of shear strength parametres for construction materials, zoning, provision of seepage control and drainage measures in the dam a

well as in the foundation, design of slope protection, liquefaction of loose pervious foundations, accounting for seismic forces and instrumentation and inter protection of proto type behaviour of dams.

Earlier shear strength parametres were chosen on the basis of direct shear treatments. With the advent of triaxial method of testing soils and rocks, it has now become possible to take into consideration the effect of pore pressures and these evolve an effective stress method of analysis

Zoning of dam is an important aspect of dam design for providing esistance to the progressive erosion lue to leaks and cracks caused by lifferential settlement, particularly n earthquake regions, and also from he point of providing greater stability o the dam. Advantage has been aken on the wide range of construcion materials available and adequate ning provided in most of the dams, xample. Hirakud, Ukai etc

Seepage control measures are esntial to protect a dam from any ndesirable and dangerous effects hese measures reduce the risk of ilure from unstability of slope, undation heave or from piping y erosion or by combined effect f all these Enough confidence has een gained to adopt concrete iaphragms for foundation treatment Jkai Dam, Tenughat and Obra ams are some of the examples herein this method has been adoped

To accelerate the consolidation rocess, vertical sand drains were sed in the clayey foundation of enughat Dam. For rapid disipation of pore pressures, new rainage arrangements consisting of orizontal filters are provided in the embankments in Tawa and Tenughat Dams.

Another interesting problem met with in recent times is the possibility of liquefaction of loose alluvial foundation at Ukai, Obra and Tenughat which are located in seismic areas. New experiences have been gained in this field following detailed study and testing of such foundations by blasting and other methods to find the necessiry or otherwise of compacting the foundation in order that they may not liquefy under action of an earthquake.

A good number of potential dam sites at favaourable locations have already been exhausted; new dam sites have to be located in difficult foundation conditions. The sites for many dams that are going to be taken up for construction fall in zones of high seismicity Construction of structures within areas of high seismicity and on a thick strata of saturated sandy or gravel desposits is considerably complicated.

Efforts are being made to establish a chain of seismological observations in all future reservoir sites located in seismically active zones

Instrumentation of dams and appurtenant works plays a vital role during and after the construction of a dam. Observations of proto type dam by means of instrumentation indicate their behaviour with respect to settlement, pore pressures, deflection, etc during various loading and operative conditions. Such observations have been a valuable guide for adopting new methods of design. An addition to the conventional methods of instrumentation is the use of slope indicaotr instrument for measuring deflection and movements in the dam and its foundatoin. Slope indicators have been installed at Ukai, Tenughat and Obra dams.

Sufficient experience has been gained by the Indian Engineers in the field of earth and rockfill dams. Beas Dam (115 m) and Ram Ganga Dam (125 m) are examples of high earth rockfill dams. There are ambitious plans to construct much higher rockfill dams with greater storage like Kishau Dam (252 m), Parvak Dam (180 m), Tehri Dam (260 m) etc.

Another interesting feature of the design is the provision of overflow on partially constructed earth dams. At Balimela Dam (70m) high, original plan of Colnstruction for closing the river gap in one season was not found practicable. Therefore, the dam was built partially. Extensive model studies were conducted to study the protective measures necessary to prevent damage to the partially constructed earth dam These showed a very uniform flow pattern and no damage was expected to the dam. As a further precaution however, the downstream rock toe of the dam was provided with 1 m thick mesh protection

Design of tailing dams in mining industry where the ore is generally melted to fine powder and chemicals are added to reclaim the concentrated ore by the flotation methods is another challage to soil Mechanics engineers. The disposal of tailings poses a health hazard if it is let down without proper retention or treatment. All these factors had to be kept in view for design of a number of tailing dams proposed in various projects like Bailadila Iron Ore Projcet, Kudremukh Iron Ore Project, Donimalani Iron Ore Project, Tatnagiri Aluminium Plant and Khetri Copper Project.

With the advent and progressive use of electronic computer, it is now possible to carry out extensive studies on various alternative dam sections and evolve safe and conomic designs in a short time.

With the sustained efforts and long experience of several dam projects in the country, it has been possible to develop confidence and self reliance in design and construction of both concrete/masonry and earth rockfill dams. The 170 m high arch dam at Idikki reflects new trends in the consiruction. The confidence and experience gained over these years, the resolute will and determined efforts are significant steps to march forward and reach greater and greater success. □

It is nice to be important

but

It is more important to be

nice.

Jnion Budget 1977-78

Yojana presents some expert Opinions on the Union Budget for the Year 1977-78

A Lucrative Budget

NANI A. PALKIWALA

JUDGING the merits r demerits of the budget, one iust, in fairness, be slow to ise, having regard to the cons-ts under which the budget has formulated The present Go-nent has not been writing on in slate. It has inherited various ies which are more onerous beneficial—a top heavy bureau-, vast commitments on projects i are in the process of imple-ation and which were based on ities lacking in both stability conomic wisdom. Further, the available to the Finance Minister conceiving and presenting the it was wholly inadequate, having d to the enormity and ty of the problems involved.

us consider, for a moment, dverse factors which constitute background of the budget Wholesale price index has been ing almost a continuous rise March, 1976, the index at nd of March '77 being 12 per higher than it was a year earlier, ey supply had increased by t 19 per cent in 1976-77 as st 10 5 per cent a year earlier. year, the rate of our economic th was less than 2 per cent, ly due to a decline in agricultural uction. The power position in ountry is most unsatisfactory. ently, there are power cuts in any as 10 States ranging from 50 per cent. The cost of money ound 16 per cent in India as against about 10 per cent abroad. The recession has not yet lifted. According to one estimate, 300 large and medium-scale units and ten thousand more units are sick. Labour unrest is on the increase. The investment market continues to be sluggish The number of job seekers on the registers of Employment Exchanges has doubled to 10 million in the last five years, while some 14 million are estimated to be unemployed. Against the heavy odds, the Finance Minister has tried to do a sincere and valiant job. The budget speech is the handy work of a knowledgeable and thoughtful personality. The Finance Minister has got his priorities right. After the nightmare of authoritarianism we have taken the first step towards an economic strategy which lays emphasis on both bread and liberty This budget is different from the past ones in some significant respects

First, Mr H M Patel is the first Finance Minister to have invited suggestions from the general public before adumbrating his budget proposals. It is in the fitness of things that the Janata Government should seek to associate the people with the formulation and implementation of fiscal, economic and other policies. It is the beginning of a truly participating democracy in India.

Secondly, there is a marked-shift of emphasis The primacy of agriculture is expressly spelt out and the national economy is to be so oriented as to develop irrigational facilities and rural infrastructure, in particular, roads, markets and supply of pure drinking water Thirdly, as against the deficit of 425 crores last year, the estimated deficit of 73 crores for the current year is the lowest since 1961-62 It is true that in the year 1969 70, the deficit was 46 crores. But in that year the total disbursements of the Central Government came to 5,500 crores as against 15,500 crores in the current budget. Thus, taking into account the fact that the governmental disbursements are almost three times what they were in 1969 70 and further taking into account the inflation during the last eight years, the deficit of 72 crores must be regarded on a fair comparison as lower than for 69 70. There is a strong determination underlying the budget to contain inflation at all costs. The negligible deficit and the continuance of the Compulsory Deposit Scheme for income-tax payers for further two years are parts of the anti-inflation strategy. Fourthly, the tax on capital gains is for the first time sought to be put on a rational basis. Lord Shawcross described the tax on capital gains as the greatest fraud in the history of fiscal legislation. He called it a fraud, because in times of inflation when a citizen sells his capital asset and gets in depreciated currency a higher amount than what he paid for it, he is asked to

pay tax on his so-called capital gains while in real terms if an allowance is made for the debasement of the currency, he may have actually made a loss.

The finance Minister has very wisely proposed three significant changes in the existing scheme of capital gains taxation. Under the current law an asset is required to be held for five years in order that it may be taxed at the effective lower rate applicable to long-term capital gains instead of being taxed at the full income-tax rate This period is now reduced to three years Secondly, under the existing law, the assessee is entitled to deduct from the sale proceeds the fair market value of the capital asset as on 1st January 1954 in place of the actual cost of acquisition Under the budget proposal, the assessee will be entitled to deduct the fair market value as on 1st January 1964 This is distinctly beneficial since inflation has steadily pushed up prices between 1954 and 1964 Thirdly and most importantly, capital gains would hereafter be exempted from tax if the proceeds of any asset sold whether house property, shares, jewellery or any other asset or reinvested within six months in shares, bank deposits, units of the Unit Trust or other specified assets This relief is subject to the fair condition that the new investment made out of the sale proceeds should be held for a period of at least three years

I would now like to come to the points on which the budget proposals seem to require re-consideration While the proposal to raise the minimum taxable limit for income-tax from Rs 8,000 to Rs 10,000 is most welcome, the proposal to increase the surcharge from 10 to 15 per cent is disquieting It is not so much the amount of the increase as the principle underlying the increase which is likely to arouse public anxiety. After 30 years of confiscatory taxation, the Finance Act last year, for the first time, brought personal income-tax and wealth tax down to reasonable levels. To increase the taxation again seems to be a retrograde step. The six fastest developing countries of Asia are those where the maximum rate of incometax does not exceed 50 per cent. Dr Ludwig Erhard, the author of the German Economic Miracle and Prof. Colin Clark have frequently expressed their firm conviction that the maximum rate of personal taxation should not exceed 50 per cent Prof Kaldon the eminent socialist said, these confiscatory tax rates apply only to a small minority of people who cannot avoid their incidence and their long run effect is bound to be wholly pernicious both in penalising the prospects of certain careers which are vital from the national point of view and in undermining public morality.

The wealth tax rates are proposed to be increased from the current assessment year I think it would be eminently desirable to apply the higher wealth tax rates from the next assessment year, that is, from the year 1978-79 The proposal to apply them from the current year is a reversal of the sound policy which was notified by Shri Morarji Desai himself when he was the Finance Minister that all changes, as far as possible should apply to income and wealth prospectively and not retrospectively The Finance Minister has proposed that investment allowance which is today available only to 32 industries should be extended to all industries except the low priority activities which are specified in a new schedule This is undoubtedly a change for the better

In order to promote scientific and technological self reliance the Finance Minister has provided for investment allowance at the higher rate of 35 per cent on machinery and plant installed for the manufacture of any article by using indigenous know-how Unfortunately, the benefit of the increased investment allowance is developed in only those laboratories which are owned or financed by the Government or public sector companies or universities It would be eminently desirable to extend this incentive also to cases where the know-how is developed by public limited companies in the private sector

The next provision which ca for comment is the very desi able proposal that when a sick u is absorbed by a profitable conce that concern should be allowed set off in respect of the carried forwa losses, a non-absorbed depreciati of the sick unit. Without such incentive, no healthy concern wou be interested in absorbing uni which are burdened by heavy los of past years. This reform, in o tax law, has been long overdu But proposed set off of the loss of the sick units is made condition upon recommendations and declar tions of certain authorities which a bound to cause unconscionable del and will rob the provision of muc of its utility and value

Since the structure of indire taxes has been amended pieceme at different times, it has, in man cases, failed to achieve the soci purposes of the Government Fo instance, after taking into accou the changes proposed to be made i this year's budget, the toal ta element in respect of commercia vehicles is as high as 58 per cent o the cost to the customer less taxes while in the case of cars and scooter it aggregates to about 52 per cent In other words, buses which constitut public transport for the masses and trucks which carry goods for al sections of society are taxed mor heavily than personal transport affect ing a relatively small and mor affluent section of society

Despite the above points on which there is room for divergent opinions the budget should prove to be a lucrative one. The developmente outlay of 8,852 crores of rupees, of which 30 per cent will be spent on agriculture and allied projects should lift the pall of the recession.

FINANCE MINISTER IS NO SANTA CLAUS

RAM PANDIT

AT LAST, the cat is out of the bag The long awaited Janata Party Budget has caused mixed feelings. The radical, have dubbed it as a Budget of the rich and the conservatives have found the proposals to be of greater benefit to the underdog than to the business community. There is no doubt about it that some relief has been given to the common man but the aspirations of the middle income group to get some relief have remained unfulfilled. The marginal buyer of durable products is the middle class man The TV set, transistor, radio, tape recorder, scooter and perhaps a car— will now be increasingly beyond his reach

General Excise duty on commodities not otherwise covered has been increased from 1 to 2%. This duty will normally be passed on to the consumer. However, a welcome feature of this excise duty is that it will apply to those units whose annual turnover exceeds Rs 30 lakhs. It is more rational to go by

annual turnover than by the number of workers employed, the criteria that was provided earlier. Indirect taxes, though regressive in nature, form an important part in our economy. As we get more industrialised, we should try and ensure that Government resorts to more and more indirect taxation, which is pregressive and demands sacrifices which are commensurate with the level of income.

The proposal to enhance the rate of wealth tax should be welcome to all those who want to establish a society which is based on greater economic and social justice As the Finance Minister himself pointed out, the first budget of the new Government sought "to accelerate the pace of economic progress and to distribute its fruits equitably under a framework of democracy and individual freedom "

What has perhaps caused great disappointment is the decision to continue the Compulsory Deposit Scheme for income-tax payers for another two years The middle income group is already paying a high income tax, contributes to Provident Fund, pays premium on Insurance Policies, etc This income group finds it increasingly difficult to save money to deposit in the Compulsory Deposit Scheme The Finance Minister could have at least reduced the amount to be desposited under the scheme substantially instead of further freezing away the limited purchasing power of the people. Alternatively, he could have made the scheme applicable only to people in certain high income brackets

Though individual industries may have cause to complain it cannot be denied that, by and large, the new budget is investment-oriented. The investment allowance scheme, which is extended to all industries except those engaged in the manufacture of low priority items, is a step in the right direction The decision to give investment allowance at a higher rate of 35% on machinery and plant will also help promotion of R & D activity, in our country.

The other good features are exemption given to the closely held industrial companies from the compulsory distribution of dividends, amalgamation of sick and a healthy industrial unit by allowing the carry forward and set-off of the accumulated loss and unabsorbed depreciation; expenditure incurred by companies on approved programme of rural development and raising the tax exemption limit of donation for charitable purposes from Rs 2 lakhs to Rs 5 lakhs

There is a tendency on the part of the people to look at the Finance Minister as some kind of Santa Claus who would fulfil all the expectations of every section of the society. We need to realise that the Finance Minister has to operate within the constraints imposed by the economic realities and has to function witih the basic economic framework designed by the Janata Party.

Since India lives in villages, the priority in our economic planning has to be given to agricultural and rural development. Larger outlay on irrigation, rural electrification, rural approach roads, fertilisers etc., will enable the economy to produce more agricultural products which will help stablise the price level and reduce the need for resorting to deficit financing

Despite heavy financial burden created by the unbriddled expenditure incurred by the Central and State Governments during last couple of years and very limited time at the disposal of the new Finance Minister to introduce any worthwhile innovations, he has successfully met the challenge and presented a budget which is almost balanced The Budgeh has neither chartered out new paths nor has it brought about a radical change in the policy making process. But it gives every reason to hope that fresh approach which has been initiated will continue in the years to come

INAUGURATION OF A NEW POLICY

C. JOHN

AS THE first budget of a new political party which had assumed power just three months back, it is bound to attract the attention of different sections of the people People had high hopes of emergence of a new policy and they would be looking for the signs of a new economic policy in the new budget It is necessary to find out whether any new economic policy is envisged by this budget This can be seen only by looking at the whole budget, by taking a connected view of the whole pattern of income raising and allocation of expenditure, especially the changes that are discernible in the priorities of the Annual Plan

If we look only at the tax proposals we may feel that we are in the beaten track. The usual attempt at balancing the budget by raising new sources of revenue by taxing commodities and increasing existing rates of excise duties is what is visible at first sight. The usual apology that the taxes do not hit the common man is also there as the levies which net in 1300 million rupees are no commodities consumed by the elite classes Yet there are some hopeful signs of a new policy in the tax proposals also The raising of the level of exemption for income tax from 8,000 Rupees to 10,000 Rupees and the additional surcharge on higher incomes give relief to the middle class people and at the same time raise resources from the upper class people The concessions to pumpsets in the matter of excise duties indicate the concern for the progress of agriculture and represents a reversal of the trend towards greater and greater taxation of the agricultural sector championed by the Planning Commission and supported by the Urban Economists over the last ten years.

The more significant changes are to be seen in some of the other proposals. The pre-Budget Economic Survey presented to the parliament by the Finance Minister on 13th June points out that investment will have to be stepped up significantly if poverty and unemployment are to be reduced; resources are to be raised so as to promote savings; reduce conspicuous consumption and contribute to a reduction in disparities of income and wealth. The changes in the investment allowance and the capital gains tax proposed in the Budget are designed to promote savings and investment so as to provide for greater employment opportunities The proposed scheme for Bank loans for self employment of the educated unemployed is a step in the right direction.

The Annual Plan expenditure for the year proposed in the budget represents an increase of over 27% over the expenditure of the last year. This has been done while keeping deficit financing at a very low level of 720 million rupees so that it may not add to the inflationary pressures

operating in the economy due to substantial deficit financing during the past few years. Over 30% of the proposed annual plan expenditure is for agriculture and other allied activities in the rural areas. This substantial tepping up of investment in the rural areas represents a return to the First Five Year Plan priority accorded to agriculture and a reversal of the trend in subsequent plans towards emphasis on industry and urban development. This change is in keeping with the ideology of the new government and is likely to bring about a better balance between supply and demand by increasing the supply of food and raw materials from the rural areas and by increasing the demand for industrial products from the villages.

This emphasis on agriculture seen in the expenditure pattern proposed in the budget when taken along with the special concessions for handlooms and the power looms represent the inauguration of a new policy by the government. A speedy and efficient implementation of such programmes will constitute th. first step towards solving the problems of poverty and unemployment in the country □

GROWTH ORIENTED BUDGET

PANKAJ KAPADIA

THE BUDGET proposals announced by the Finance Minister, though not coming up to the high expectations of the people in general, are expected to stimulate investment and accelerate industrial growth. With tax proposals netting about Rs. 142 crore, it must be said that the burden is quite modest in the present situation.

Though direct taxes have been levied on corporate sector and are expected to bring in about Rs. 92 crore, the increase in taxation has been compensated by increase in and extension of investment allowance to almost all industries except a few ones. In fact, as has been pointed out by the *Economic Times* the total gain to the corporate sector will be in the region of Rs. 220 crore as compared to Rs. 45 crores, more or less making up for the loss of the development rebate discontinued last year. Thus the net gain will be of the order of Rs 83 crores or so. The proviso that the plant and machinery installed will have to be Indian, will also help in the development of indignous technology and thus promote growth in that sector.

The third measure which wil help investment is the Finance Minister's proposal of excluding dividends up to Rs. 250/- from the deduction of tax at source. This will save small investors from the botheration of filing returns etc. to get the refund of tax.

As regards the textile industry which is the major industry in distress in the country, there is no special relief to this industry. With the Finance Minister's assurance that they are going to rationalize the tax structure within six months, it can be hoped that something would be done to help the textile industry which is one of the major industries in the country.

It would, however, have been better if the Finance Minister had not taken away the option of the corporate sector of depositing an equivalent amount with the Industrial Development Bank of India for a period of five years, in lieu of paying 5 per cent surcharge on income tax. Or the Finance Minister could have given relief to the corporate secto in some other form.

A LARGE INFLATIONARY POTENTIAL

P. R. BRAHMANANDA

THE FIRST budget of the first Janata Government will have to be appraised in the light of the policy pronouncements of the new Prime-Minister and the leaders of this Party. The Prime Minister has, more than once, categorically stated that his Government would immediately attend to (a) the containing of inflation and (b) the reversal of price-trend. The spokesmen of the Janata Government have been asking the public to look to the new Budget for the announcement of package of anti-inflationary measures.

Between March and May end this year, money supply has expanded by about Rs. 582 crores, if this rate of expansion prevails over the whole year, the annual rate would be more than 22 percent. The net bank credit to the Government sector has expanded within the short span of 2 months by as much as Rs 1200 crores, three times the expansion of such credit over the whole of 1976-77. Bank credit to the commercial sector has expanded by nearly Rs 100 crores within the 2-months period. The claim that the growth of foreign exchange assets is reponsible for the increase in money supply may not be borne out by a deeper examination inasmuch as a large portion of the increase in foreign exchange assets would have been reflected in the form of accretion of time deposit over these two months. It is also not possible to explain the monetary expansion in these two months as being due to expansion in credit to the Food Corporation. **Not a single price of any essential commodity has come down during the period of two months.** On the other hand, almost all prices have risen and are continuing to rise. The wholesale price index has risen by 3 per cen within the period of two months. At this rate, the price rise durin 1976-77 may exceed 20 per cent prices do not go up at a steady rate the rate accelerates. Looked at i terms of the above backgroun there was every reason to hope fo and expect, a strong package o anti-inflationary measures in th budget. In a period of high an rising inflation, the budgetary, fisc and monetary policies should b directed toward restricting credit o behalf of both the public and th private sectors. Immobilisation o liquid resources is one of the m important instruments tried an successful in India, of restricting th flow of money and of expenditure similarly jacking up of interest rat is another instrument. The pr portion of resources commandeere by taxes will have to go up in su

a situation.

The first Janata budget, unfortunately, appears to have adopted an entirely opposite set of perspectives. There is a provision for borrowing on the basis of treasury bills from the Reserve Bank to the extent of Rs. 72 crores, but the total borrowing commitment as reflected in the figure of net 'market' borrowing is about Rs. 1,000 crores; Rs. 110 crores more than what was provided for in the vote-on account budget two months ago. Of this, easily 50 per cent would represent lending by Reserve Bank and the Commercial banks; about 500 crores of increment in monetary resources would occur on this score. The fresh activisation of the immobilised funds, now transferred to the Provident Fund Account, is of the order of Rs. 130 crores; almost the whole of this would constitute an increase in money supply To this must to be added the borrowing in lieu of additional funds immobilised by the Reserve Bank in the first few months of this year on account of the impounding of a portion of additional D.A., etc. This may contribute to the activisation of another Rs. 50 crores, all of this adding to money supply. There is also a drawing down of US rupee balance deposits to the Government of India under the Indo-US agreement to the extent of Rs. 45 crores In addition to all this, there is the special borrowing against foreign exchange resources to the extent of Rs 800 crores The total budgetary deficit would thus be of the order of Rs 1597 crores or sbout Rs. 1,600 crores Of this amount, Rs. 800 crores or so would definitely represent an addition to the monetary resources to the community, as a direct result of Government budgetary operations. The money-supply expansion component would be more than Rs. 500 crores. Rs 800 crores of borrowing against foreign exchange reserves also can have dangerous implications in terms of the expansion of monetary resources in the country. This is as follows. Obviously, this 800 crores are not intended to be lent to the Food Corporation or other agencies for the import of food or oil or other commodities. Some of the commodities are imported on private account. We cannot assume that the 800 crores would be wholly taken in the form of foreign exchange by the Government of India in so far as the Plan outlay for 1977-78 is concerned. If we include net external assistance and the assumed borrowing of Rs. 800 corres of foreign exchange, the exchange component of outlays would be incredibly large. Naturally, there is no reason to believe that this exchange is required for purposes of filling the foreign exchange gap of Plan expenditure nor is there reason to hold that the latter has been devised with a view to absorbing this amount of foreign exchange. If the rupee resources are lent to financial corporations and other, on the plea of helping them to obtain foreign exchange, it is quite possible that such loans may be taken primarily in the form of rupee resources, thus activising the exchange which, at present, is not circulating as money. There is a great fear that the type of borrowing now being undertaken by the Government might activise the foreign exchange like money itself and this may lead to the same phenomenon as happens due to the circulation of euro-dollars in Europe and other countries Central Banks in these countries take special measures not to activate foreign exchange. There is room for the fear that the bulk of the borrowing against foreign exchange may eventually be reflected in domestic monetary expansion since no counter-veiling reasons for the use abroad of exchange reserves by the Government have been given

We are, therefore, constrained to conclude that the first Janata budget has a large inflationary potential built into it There is another aspect of the budget which is very disturbing from the angle of any anti inflationary policy The Finance Minister has announced a number of concessions and reliefs In many cases, these reliefs are not coupled with the requirement that the resources so released would be saved and reinvested in specific categories of saving, accruing to the public sector In a poor country where more than 50 per cent are living below the poverty line, the case for raising the exemption limit cannot be supported by economists Not merely has the exemption limit been raised to about Rs. 10,000 of annual income, but the Finance Minister has not made this exemption conditional upon released resources being reinvested in certain forms of savings. If we assume that about Rs. 660 per capita per annum constitutes the poverty line, the average per capita national income being around Rs. 1,120 per annum, the exemption limit per capita will now be about 7 times the poverty-line: The Finance Minister has announced a number of tax concessions to companies and firms for undertaking rural development and for utilisin[g] indigeneous technology developed i[n] public sector agencies as well as i[n] Universities. He has given con[si]derable reliefs in capital gains tax an[d] has also reduced the tax base fo[r] capital gains. Capital gains accruin[g] over shorter-periods are also ad[]missible for reliefs. All these mea[]sures involve the foregoing of re[]venues and whatever may be thei[r] desirability or the opposite otherwis[e] they are definitely questionable in the present context since they enlarg[e] the size of the deficit.

Prior to the budget, the authori[]ties—fiscal and monetary—had an[]nounced a calculated retreat fron[m] dear money policy. From the mone[]tary-fiscal experience of the last [] months it appears that not merely is the economy being flushed with liquidity but lending terms too are tending to be liberalised (there are some concessions also to financia[l] corporations in the new budget) Money is becoming more abundan[t] and less dear. In this context the Janata Party has none to blam[e] but itself if a bold opportunity fo[r] a package of anti-inflationary mea[]sures has been lost by the Financ[e] Minister What should the Janta d[o] if the prices continue to soar and th[e] economic situation turns out to b[e] more difficult

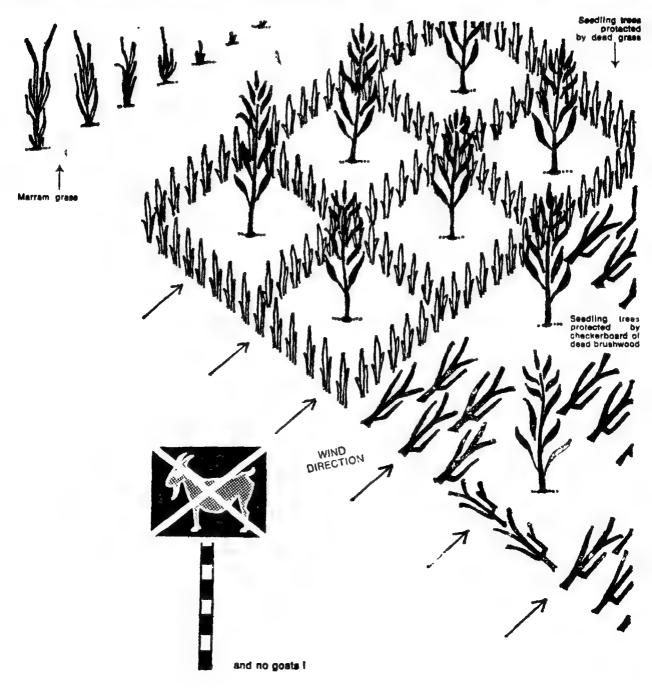
STOPPING THE DESERT

Once the front-line is contained, the natural vegetation will be replaced by crop plants.

Some of the current ideas and means of fighting desertification are shown in this page. The problem of halting desert spread is particularly difficult, partly because, almost by definition, most desert areas are in poor and under-developed regions of the world. But natur and artificial means of haltii encroaching sand are bei increasingly employed; son


are almost traditional, others are the product of modern technology. Once the front line has been held, trees-most of them already natural inhabitants of desert areas-can be established, to be followed later by crop plants. But the front line is thousands of miles long-globally speaking-and gains in one region will perhaps always be offset by advances of the desert elsewhere.

Three of the means of halting the progress of sand dunes are illustrated here. Where there is at least some rainfall, or water is otherwise available, certain grasses can help stabilize the dunes. They include marram or beach grass (Ammophila arenaria), and esparto or alfa grass (Stipa tenacissima); these spread by long trailing roots from which new tufts spring up. Where not even grass will grow, hedges of dead bamboo or grass stems or a checkerboard pattern of dead branches may hold up the sand. Behind the hedges and in the spaces, trees or desert shrubs may be planted. Sand may also be stabilized by spraying with bitumen-for example, in oil-rich desert countries-or with a chemical that forms a thin, protective layer; trees can be planted in gaps, while the chemical prevents loss of moisture by evaporation.

Water

Because the principal characteristic of all desert and semi-desert regions is an extremely low and irregular rainfall, water must somehow be made available from below ground if permanent vegetation is to be established. In some areas this is quite near the surface and can be got by ordinary wells. Elsewhere, it may be possible to trap and even heavy thunderstorms. But the most reliable source is from deep down, where water that fall as rain-perhaps several hundred years ago-is trapped in permeable strata, often held between two impermeable layers, can be tapped by artesian wells. Where the pressure of the subterranean water forces it to the surface and makes irrigation-and human habitation-possible. Water near to the surface, and not under pressure, can be got by sinking tubewells and pumping the water up when required. The first system is typical of the situtation in much of the Sahara; the second has been much used in the desert areas typical of the Lower Indus basin in India and Pakistan.

The traditional tree of the desert regions, especially in North

Date palm

Africa and Arabia, is the da palm which provides foo timber and the materials f shelter. Now increasing use other trees, such as vario species of eucalyptus and juju (Ziziphus), is being made establish vegetation and occu the lands won back from t desert. The many species acacia, too, can survive und all but the most extreme dese conditions, and have trad tionally provided fodder f camels and goats. But t exclusion of the latter may essential until they can properly controlled and veget tion is firmly established.

RAJASTHAN CANAL

The Man-made River that will Make the Desert Bloom

A YOJANA STAFF

REPORT : **N. N. CHATTERJEE**

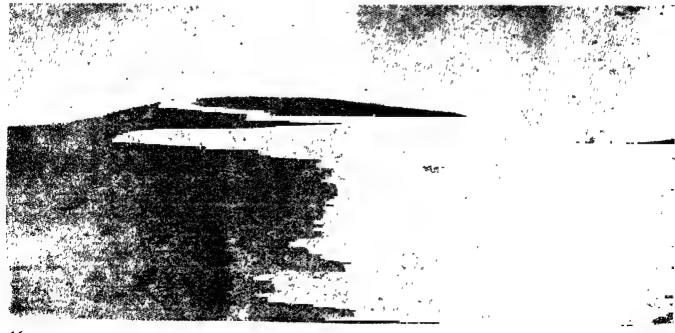
PHOTOGRAPHS : **P. K. KAPOOR**

ARCHAEOLOGICAL evidence suggests that a highly sophisticated civilization existed in Pilibangan in Ganganagar district of Rajasthan over 3000 years ago when the river Saraswati flowed here before joining the sea near the Rann of Kutch. The available evidence also shows that there was a a widespread drainage network in the Luni, Ghaggar and Saraswati basins and that the entire region was fertile and wooded. Since then, Saraswati has gone completely underground, the Ghaggar valley has changed from its original greenery to an arid desert. The river Ghaggar cannot be seen except when it comes alive after monsoons to lose itself again in the sands of northern Rajasthan

In contrast to the lush greenery of Punjab this part of Rajasthan has all the appearance of a cosmic slag heap Little can survive in this seared land of unending sand. Often the traveller's only companions are the swirling winds and dust storms reminding the helpless traveller that he is an unwelcome guest. Heat generated by the searing Sun blows on his face in this inhospitable desert and the first thought that comes to him is to beat a fast retreat.

For miles and miles there is no habitation. *Phog* shrubs on which not even goats can feed, stray camel drawn carts, heaps of shifting sand dunes and thorny *Khejhri* trees are the only sights to be seen. Except for occasional buses or lorries there is very little traffic on the CPWD highway (NH-15) which connects Jaisalmer with Bikaner. Electric transmission lines running along the highway remind one constantly of the fact that this is a part of civilization and not a part of the thirsty Thar.

Scientists say that this is a man-made desert, the bitter fruit of generations of thoughtless use of land, uncontrolled cattle-grazing, which destroyed the green cover. For untold centuries this process of desication has gone on with man retreating farther and farther away from this hostile environment. Those who continue to inhabit these expansive tracts have adjusted, like the goats and sheep to its aridity and waterlessness and the resultant poverty—a classic example of the surrender of man to nature's fury However, today one sees the assertion of human will to undo the mis-

For miles and miles there is no habitation. Only swirling winds dance like ghosts on the seared land of sand dunes.


take of yesteryears. Both the people and the Administration are steadily transforming these deserts into smiling farm lands. The Ganganagar district symbolises the triumph of man over nature.

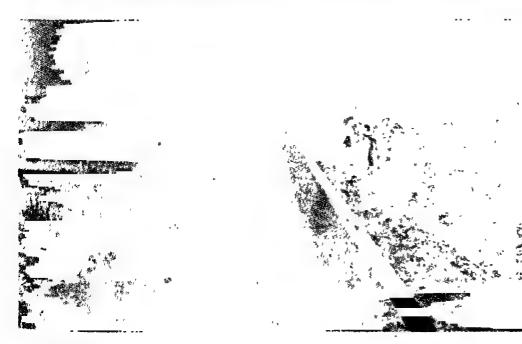
The Central Water and Power Commission made the first estimate for the proposed Rajasthan Canal Project in 1951 by conducting a survey. It recommended that the Rajasthan Canal should start from the Harika Barrage in Punjab and be taken upto Jaisalmer district so as to irrigate about five million acres in the north-western region of Rajasthan which forms a part of the Thar desert.

Rajasthan covers an area of 3,42,214 sq km, of which about 37 per cent is desert area. Of the gross irrigated area of 25.45 lakh hectares of land; 55 per cent is irrigated by dug wells, 35 per cent by canals and 10 per cent by tanks The net area sown is about 134 lakh hectares. As such agricultural production is mainly dependant on rain fall which is less than 130 mm in a year.

The Rajasthan Canal Project consists of a 214 Km long Rajasthan feeder canal (the first 178 km of this canal pass through Punjab and Haryana and the remaining 37 km in Rajasthan) and the 467 km long Rajasthan main canal lying entirely in Rajasthan. The first stage of the project consisted of construction of the feeder canal and 195 km of of the main canal lined with tiles and bricks through the desert. The formal start of this gigantic canal project was made on March 31, 1958 and Dr. S. Radhakrishnan, the then Vice-President of India, inaugurated the first flow of water from this life channel on October 11, 1961, in the Naurangdesar and Rawatsar distributaries. The completion of Stage I would almost be over by the end of Fifth Plan at an estimated cost of Rs 176 crores. The Second Stage covers the construction of the remaining 272 km of the main canal, work of which has also been taken in hand.

The Canal aims to irrigate a C.C.A. of 5.4 lakh hectares in Stage I and 7.6 lahh hectares in Stage II of the Project. The intensity of irrigation has been kept at 110 per cent in Stage I and 96 per cent with lined water courses in Stage II of the Project. The total length of main canal will be 649 km which includes 215 km long Rajasthan Feeder Canal. Its branches, distributaries and minors will measure

People are forced to move with the constant shifting of sand dunes.

At 22A Chawk in Anupgarh distributory, government built quarters for the Pong Dam ousted families are lying vacant. Uptil now only 5 per cent people have come there to live.


The main canal which runs through the desert, is lined with tiles and bricks to prevent seepage of water.

6,396 km in all! The length of the field channels is expected to be about 60,000 km;

Meanwhile this man-made river has already proved a boon for the people of this north-west area of Rajasthan. While in 1971-72 only about 1445 hectares were under irrigation in this area, in 1974-75 it rose to a record figure of 2,50,000 hectares.

Early completion of this vital project is necessary to remove poverty and the untold sufferings of the people who are forced to move with the constant shifting of sand dunes. But this depends mainly on the availability of funds and construction materials. The position of estimated cost and expenditure so far is given in the next column.

As such Rs 236 crore is still required to realize the irrigation benefit.

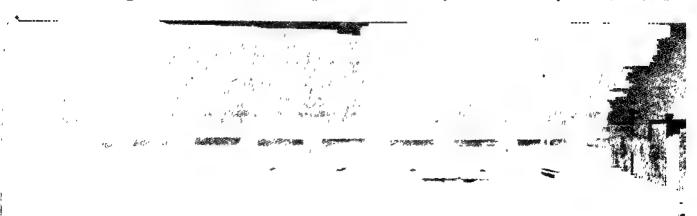
According to Shri D.S. Notra, the Chief Engineer, who is controlling

		(Rs. in cro	
	Stage I	Stage II	Tot
Estimated cost	176	220	39
Expenditure incurred till the end of 1976	150	10	16
Balance	26	210	22

the whole project upto Anupg Shakha, a good deal of hard w has gone into building the can Yet much more remains to be dc Rate of development upto now been rather slow. Main constra so far has been lack of adequ funds. Other causes were lack proper communication facilities this in-hospitable wasteland, ina quate transport, scarcity of water construction and limited m power. Majority of the labour g away as soon as harvesting start

A group of engineers who i this correspondent at the site rela the tragic story of a Junior Engin who was working on the Stage project (near Bazzu) at 320 km the Rajasthan Canal. The engin it seems, lost his way in this cr inhospitable land. He looked ri and left for water. In the end became so desperate that to quer his thirst he drank his own ur and ultimately died.

For construction purposes wa is brought via pilot channel fr the main Rajasthan Canal T water is also needed to maint the colony of workers In otl

Lift irrigation has been started to irrigate the desert region which will not directly benefit from the Rajasthan Canal network


words, life has to be made possible in the lifeless desert before construction work can be taken in hand.

Shri Notra said that for transporting construction material formerly they were depending on mules and machinery but now camel cart has been introduced. Three thousand camel carts have accelerated the work of the project

With, the completion of Pong Dam, supply of irrigation water to 12.62 lakh hectares has become certain. On full development, the project is expected to yield agricultural produce worth more than Rs 300 crores per annum The enthusiastic way in which both the engineers and the workers are working on this project, one can safely say it is possible to complete this mighty canal project in about five years, provided adequate funds are available.

For lining bricks are needed, which are made departmentally. A girl carrying water from the pilot canal.

Lift Irrigation

A new scheme has been started to meet the irrigation needs of the desert region which will not directly benefit from the Rajsthan Canal and its net work Some time back, the National Commission on Agriculture recommended a series of lift irrigation schemes for draught-prone areas of Churu, Bikaner, Jodhpur, Jaisalmer, Barmer and Nagaur. The Water and Power Development Consultancy Service have also prepared an Approach Report for Rajasthan Canal Stage II.

According to this Approach report an area of 2.5 lakh hectares, which are less suitable for irrigation is proposed to be omitted from the present six lakh hectares of Stage II of the Rajaslhan Canal as such only 3 5 lakh hectares will be retained under flow and taking up a new area of 3.89 hectares involving lift up to 90 metres. The intensity of irrigation has been estimated at 110 per cent.

In the Stage II of the project, it is being considered that at least 5 lakh hectares area under flow, out of the 6 lakh hectares proposed in the project report of 1975, may be retained alongwith 2 6 lakh hectares new area as suggested by the WPDCS report with a lift upto 60 metres by reducing the intensity of irrigation to 96 per cent from 110 per cent

Husan Sagar pumping station lifting water up to about 3 metres.

Any one visiting this area after a lapse of 15 years will see how this wasteland in the western border of India has changed beyond recognition. At the same time, all the expectations of rapid development of the area have not been fulfilled. Despite the fact that Government took lot of pains to allot land to the people suffering for generations, the results have not been commensurate For settlement in the command area of Rajasthan Canal first priority was given to people who were ousted from their homes due to the construction of Pong Dam. Besides compensation in cash they were also given land in this area. However about 9,000 such families have given out their land on rent and at present only two thousand families are still in occupation. At 22 A Chawk in Anupgarh distributory, government built quarters

Shri Tej Kumar, the Area Development Commissioner, Bikaner area.

for the Pong Dam ousted families, only 5 per cent people came there to live The result is land is there, water is available, but people have no interest to start a new life there

What particular constraint made this project hang on for so long? Why are the people reluctant to settle down here? According to Shri Tej Kumar, the Area Development Commissioner the original constraint was the non-availability of coal and cement, now it is not so much. Of course labour was a big constraint too. During harvest time most of the labourors went away. Much more work could have been done if the labour were available throughout the year.

As regards land allottment policy, some rethinking needs to be done. The allottment rules say:

First land to be the revenue village, secondly Panchayat, thirdly colonization tehsil and forthly to the people living in the district When suitable persons in the district are not available then people living in neighbouring district should get priority The problem of settlement at Bikaner area is serious. In March 1976 more than 7,250 were allotted land to settle down in this area and till February, 1977, not a single person has come there. The offer was given to the landless and Harijans Farming has a peculiar trend and farmers' values are as old as rocks. A landless boy working in a Jaipur hotel most likely will have neither the capacity nor desire to take to farming Thus the egg has to be broken very carefully. A rethinking is certainly necessary in regard to colonisation The suggestion is to auction land, to those interested in agriculture. This will result in better utilization of land

A brighter future certainly awaits this area And as soon as the problem of settlement is solved the magic touch of Indian farmers will change this area into a given granary of prosperity □

A Dream Comin[g] True

O. P. Sharma

It is really a dream coming t[rue] for people of parched dry la[nd] called Kandi areas in local p[ar]lance by construction of Rs. 40 crore Ravi Canal Project, a pre[sti]geous and biggest irrigation proj[ect] in Kathua district of Jammu a[nd] Kashmir State.

The thirsty barren fields yiel[d] little, if anything. Farmers look in vain to the rain Gods. A n[ew] hope is emerging with the R[avi] Canal project. At present t[he] work on the project is going on full swing. Rupees 3.64 cro[res] are expected to be spent on construction during the curre[nt] financial year as against only R[s.] 1.23 crores spent since its incepti[on] in 1973-74. The project is e[x]pected to be completed by the e[nd] of 1982-83 with an estimated co[st] of over Rs. 40.00 crore. Of tl[his] Rs. 17.40 crores are being spe[nt] upto the end of the Fifth Five Y[ear] Plan period while over Rs. 22.[..] crore will be spent during the ne[xt] Five Year Plan. On its compl[e]tion, the project will irriga[te] an area of over 106560 hectar[es] of land

Three thousand camel carts have accelerated the work of the project

WATER—The Source of Life

LALIT THAPALYAL

Water is the source of life, and yet about 80 per cent of the people inhabiting the rural regions of the developing world have no access to safe water. An even higher percentage lack facilities for sanitary disposal of human wastes, and remain constantly exposed to intestinal infections carried by contaminated drinking water.

The importance of safe water as a factor in preventing disease and promoting health has been increasingly recognised over the past decades, but action to rectify the situation needs to be accelerated.

LIFE began in water. Billions of years later, the organism reached out towards land and arnt to survive in air out of water. he stream of life flowing through ie labyrinths of time brought counts creatures into being culminating i the advent of man, essentially a .nd-lubber. But the bond with ater, the mother element, remained lot only does the human individual art life's journey in the embryonic ick of fluid but the body cannot irvive without water more than a w days. Alluding to the bloodlled mammalian body consisting ine tenths of water, a biologist as whimsically pictured human beigs as 'walking bags of sea water'. hese "bags" must be replenished ith intakes of water throughout ur lives to maintain the body's uid balance Two of man's most mportant lifesustaining activities—griculture and industry—are dependent on water.

Water is thus vital to human xistence, but so is it to other forms f life Many of these, seeking ioisture and food, find devious ays of entering the human body nd bring disease and death. The ife cycles of the organisms responsible for water-borne diseases ividly demonstrate the inter-depenence of life, from the microbe to ian. From water, which sustains fe, also comes the threat of death nd disease. In order to survive nd maintain good health, man must emain on guard against polluting ne of the most important elements of his environment—water. This applies also, though to a lesser extent, to the two other elements of the biosphere, land and air.

The study of man's relationship with the various elements in his surroundings, and the use of this knowledge to prevent disease and promote health, are the major concerns of environmental health It seeks to ensure that human beings live in harmony with their environment, drawing sustenance from it and using it for social and economic needs without endangering their health or disturbing the ecosystems. In many cases man himself is the agent of the environmental pollution that threatens his well-being. With the advance of civilization have come rising populations and overcrowded cities and shanty-towns choking in poor environmental sanitation Industrial growth has contributed to air, water and soil pollution

The various aspects of the problem are reflected in the environmental health programme of the World Health Organisation (WHO). Heading the list of priorities in this programme is provision of basic sanitary measures, of which the main elements are safe water supply and disposal of human excreta and other wastes. In 1975, more than 57% of a total of $ 20.5 million allocated to WHO's environmental health programme was spent on activities aimed at providing basic sanitary measures and services. The reason is obvious: some of the leading causes of death and morbidity in the developing world are water-borne diseases such as cholera, typhoid fever, diarrhoea, dysenteries and intestinal worm infection. The vectors of dengue haemorrhagic fever and filariasis breed in insanitary, stagnant water in areas where the drainage is inadequate or non-existent. This applies also to some varieties of the anopheles mosquito, vector of malaria. Schistosomiasis, an infection borne by a water snail, perpetuates itself in communities lacking sanitary facilities as the eggs of the disease organism discharged in the urine or faeces of the sufferers are washed into rivers, canals or lakes to start a new chain of infection. It has been estimated that the burden of sickness in the world could be immediately cut down by 80% if it were possible to supply safe water to people everywhere. But to make this a practical proposition requires not only large resources but a determined effort on the part of the governments directly involved to free the poorest sections of their people from the vicious grip of disease and poverty The grim fact is that more than 1,200 million people of the developing countries have no safe water supply and more than 1,400 million no sanitary waste disposal facilities.

These are inhabitants of areas with the highest rates for infant and child mortality and deaths and sickness caused by communicable diseases. While it has not been possible—mainly owing to lack of data and a variety of complex factors that contribute to disease prevalence—to establish an exact numerical correlation between poor sanitation and disease, it is not difficult to see that no community can free itself from the grip of enteric diseases if its drinking water, polluted by human wastes, is a constant pathway for disease organisms travelling along the route: man-faeces-water and/or food-man.

By contrast, in communities where water supply and excreta disposal have improved, many enteric diseases have ceased to be public health problems. The outbreak of cholera is a case in point. Even a few cases in an Asian or African community lacking a protected water supply system often explode into an epidemic; in countries of Europe where water-works and waste disposal systems have been perfected,

---

Shri Thapalyal is Public Information Officer at WHO headquarters in Geneva.

imported cases of cholera have been reported every year since 1970 but without similar consequences.

The principle was vividly demonstrated during a cholera outbreak in the Mulanje district of Malawi in 1973-74. A study of the distribution of the disease showed a striking difference between areas receiving piped water and those served by unprotected surface water. Moreover, the victims in the area receiving piped water were shown to have either caught the infection in villages other than their own or to have been using the contaminated surface owing to the distant location of the standpipes.

The lack of basic environmental health facilities for over one-third of mankind and the resulting cost in terms of sickness, deaths and thwarted economic growth cannot be ignored in any effort to promote development and raise the quality of life. The provision of safe water and sanitary waste disposal facilities to the urban and rural populations of the developing countries is therefore being pursued by WHO as a major objective during the present decade, designated by the United Nations as the Second Development Decade (1971-80)

Development Decade

The goals set at the start of the decade were modest enough· 60% of the urban population to have house water connections and 40% access to standpipes, and 25% of the rural population to have safe water by the end of 1980 Even while the targets were adopted it was felt that they might be difficult to achieve owing to population growth and other factors, such as shortage of funds and trained manpower However, a mid-decade review (1971-75) has shown that at the rate of the progress achieved so far, those goals are likely to be realized in most of the developing world. All targets are being revised upwards with the exception of that for urban population to be served by standpipes. Targets for the provision of excreta disposal facilities have been set for the first time ever. The total global investment in the proposed new targets for community water supplies in 1976-80 is estimated to be in the region of $ 21,000 million—an approximate annual investment per head of $ 1.81, taking the estimated 1980 population of the developing countries as the base. The estimated global investment in excreta disposal projects is $ 14,500 million, or $ 1.25 per head. The community water supply programme will directly benefit 479 million people and the waste disposal programme 432 million.

Where does all this money come from? Not from WHO, with an annual regular budget of about $ 140 million, nor from any other single member of the United Nations system. The major contribution must come from the countries benefiting directly Additional resources are expected to be generated, thanks to the close collaboration between WHO, UN Children's Fund (UNICEF), UN Development Programme (UNDP) and the International Bank for Reconstruction and Development (IBRD), the support of bilateral agencies, and long-term loans by regional banks once they are convinced that to invest in waterworks is justified on socio-economic grounds

The funds available are utilised in various ways, depending on the state of development of the country, and its immediate and long-term needs In a typical case, WHO cooperation may begin with helping the national health authorities organise a nationwide technical and institutional study of the water supply and waste disposal facilities The investigation will reveal areas where demands are not being met, what are the main hurdles, and what the government and international agencies can do about it This will enable the government to assess the country's water supply and sanitation needs within the context of the total health programme and of other development activities It will be possible to choose realistically the type and size of the population to be covered, decide the type of services to aim at and determine the level of the governmental and international action In the case of projects requiring a large financial outlay, WHO helps further by identifying viable investment projects and informing potential donors and lending agencies

As recent examples of investments following such studies may be mentioned: India IBRD appraised a $ 78 million water and sewerage project that will benefit 6.2 million prople; Oman A UNDP-assisted water supply project costing $ 435,000 was formulated, Republic of Korea A UNDP-assisted project for sewerage was drawn up for the city of Seoul In Latin American countries, the total investment in programme of water supply and sewerage over the period 1961-75 reached $ 5,000 million. A large numl of projects have been carried o by WHO in close collaboration wi the Inter-American Developme Bank, IBRD and the Canadi International Development Agen

The focus of the programme h been shifting increasingly to t rural poor, for it is in the ru areas of the developing countr that the magnitude—and the glari injustice—of the problem is mo strikingly evident. About 80 p cent of these people have no acce to safe water and even more a without sanitary waste disposal fa lities. And yet, these are the peop who as farmers, cattle raisers, villa craftsmen, forest workers and fishe men, contribute the major share the gross national product in t primarily agricultural economies the Third World. In recent year more and more governments ha accorded a high priority in tl national health plans to the enviro mental health needs of the rur communities.

A water supply programme e pecially aimed at rural areas of tl developing countries is being carri out with substantial material suppo from UNICEF The constructi of tubewells with handpumps is major goal of this programm and good progress has been ma in some countries Bangladesh, f example, constructed 100,000 ne tubewells and repaired 40,000 with the past four years Pakistan hop to install 35,000 tubewells/handpum by the end of 1976 under a schen launched four years ago The R public of Korea over a period three years (1972-75) has succeed in ensuring easy access to safe wat to 50% of its rural populatio Nearly 4,000 simple rural wat supply systems have been install and thousands of dug wells con tructed or repaired in a programn which is also supported by tl World Food Programma Notat progress has been made in tl Region of the Americas particular in Argentina, Chile, Mexico ar Uruguay in terms of the number rural people having access to sa water.

One of WHO's tasks is to colle develop and dessemınate informatio on water supply and waste dispos technology that could be adapt for use in developing countries 1975, for instance, a considerat amount of information was collect on certain types of handpumps ar other methods of extracting wat which will be used in prepari guide-lines on the subject.

In many rural areas the village pond is the main source of water—and infection. A method has been developed to use the water without risk to health by providing an infiltration gallery in the bed of the pond that filters the raw water and delivers it into a well at the edge of the pond. A planning guide for rural water supply that could be adapted to varying local conditions is being prepared by WHO for use in rural development projects

These are examples merely of what can and is being done to improve water supply and waste disposal in rural areas of the developing countries. What has been achieved so far barely touches the fringe of the problem. But valuable lessons have been learnt for he future The best results have been achieved where the governments showed a firm determination to carry the programme through and were able to ensure community participation

This experience has confirmed a number of principles that WHO regards as basic to the development of environmental health programmes.

According to this approach environmental health projects and activities should be regarded as an integral part of the national socio-economic plans, and should be allocated national resources in consonance with the country's other priorities. A major goal should be provision of basic sanitary facilities to the largest possible proportion of the population as a means of improving health, with a marked emphasis on underserved communities. Particular attention should be given to community participation, utilisation of local resources and development of self-reliance among the people served If safe water is essential to the well-being of a community, the community participation in building and maintaining a water supply system is no less vital. Once involved, the people can contribute in many ways towards the cost of construction and maintenance of the system, and keeping it free from pollution. Many development projects may leave the poorest sections of the community untouched, but the benefits of a conveniently located safe water supply system directly reach the lowliest home in the village. By consrast, the lack of adequate and safe water puts its stamp of suffering and misery on the entire community, and lowers the quality of life as a whole. The recognition of these facts has led to many welcome developments in the recent past. The heightened awareness of life's dependence on water, and of the plight of the millions with no access to an adequate and safe water supply have roused the social conscience, and spurred remedial action at the community, national and international levels. □

Making Deserts Bloom

NEERAJA

THE DESERT, like the world oceans, has begun to give up its mysteries as man extends his activities to these hot, sandy, and hitherto supposed to be barren stretches.

In USSR alone, whose deserts cover more than 200 million hectares, comprehensive studies are under way at 42 stations, using up-to-the-minute techniques including aerial and space photography.

The deserts in the USSR are rich in oil, natural gas, minerals, and the Karakul sheep famed for its wool, inimitable in colour and quality In fact, the livestock products of the deserts are of a better quality and cheaper than in other natural zones. Unfortunately, the fodder resources are not stable, fluctuating from year to year

A desert does not tolerate a wrong decision. For example, a canal can turn a sandy patch into a bloosoming fertile land in 10 to 15 years. But if a drainage network is not constructed in good time, the same soil will turn into salt bottoms or swamps.

Soviet scientists are studying the problem of raising the productivity of desert pastures. Desert animals are rather choosy. For instance, only desert vegetation with its peculiar properties can obtain Karakul. Scientists conducted experiments in the most arid sections of the desert where annual precipitation is 120 to 140 mm The object was to raise productivity without violating the natural equilibrium and without using additional sources of moisture

A certain amount of moisture does exist in the sands. Plants like saxaul and some other shrubs can survive in the most arid conditions. But the seeds must be fixed in the soil. This, it has been found, can be done by elementary agro-technical methods—harrowing, ploughing and sowing at the right time

Upto 3000 sprouts per hectare were obtained during experiments. Every hectare yields over eight metric centners of fodder-nearly four times that obtained in ordinary, unattended natural pastures. Besides, half a ton of wood is obtained per hectare from the shrubs White saxaul, chogon, cone-bearing jointfir and some grasses are found most suitable for sowing. They also ensure a balanced ration for Karakul sheep.

Man-Desert Relationship

To develop the deserts, man too must live and work there. But the man-desert relationship is not easy to form. The sun heats not only the sand, but machines and walls of buildings. Under these conditions, men fatigue easily. The water and salt metabolism is also upset.

Scientists are trying to find ways to raise the organism's resistance to high temperatures and other desert factors. A special work schedule for summer months has already been evolved for workers in the Karakum desert where reclamation work is going on. A longish rest period during the day was seen to increase labour productivity by 12 to 17 per cent. In the fields, machine-operators are given two intervals and an airconditioned rest period.

A beverage prepared from green and camel's thorn has proved helpful in summer months. It has greatly cut down the incidence of gastro-intestinal diseases. A new recipe for a tonic is now being tested.

Air-conditioned cabins in tractors have been tried successfully and new methods of remote control of machines are being developed. Scientists are already on the trail. They will master soon the means and methods that would enable man to actively work in the conditions of a hot desert.

SOME INCOME POLICY ISSUES

S. K. WARRIAR

AN INTEGRATED policy linking wages, incomes and prices is attracting the attention of the policy makers currently. It is a matter of great satisfaction that the Government is moving away from deficit financing and considering effective measures to control inflationary tendencies. In our country, pressures to consume more than what is produced or demands for consumption to precede production were mounting in the past. That this is an impossibility has now been realised is a welcome break from unrealistic policies of the past. But still the thinking is only on linking incomes and prices. The fact that both these are indissolubly connected with productivity is not adequately appreciated. It is necessary to integrate productivity also into any such policy. In fact what we should consider is a productivity, income and price policy. This is the time to have an appraisal of the legacies of the past, learn from past mistakes, evolve right policies and implement them effectively to manage our resources for the good of the country.

Real Income Vs Money Income

Independence from alien rule ushered in a new era of high hopes and ambitious aspirations for progress and prosperity of the people in our country. However the economic development achieved through four (and a half?) Five Year Plans has not measured up anywhere near these expectations. The economic development of a country has to reflect in the standard of living of the people. And improved standard of living depends on the availability of goods and services for the consumption of people. Income is derived from the work we do and the goods and services we produce. The fiction of money that we created out of the token of exchange of commodities appears to have deluded us to believe that money is income. We have to get out of the concept of income in money terms and think of income in terms of physical availability of goods and services, i e , real income. The standard of living is a function of real income not money income. What we require to satisfy our needs are material goods like food, cloth, medicines, fertilizer, pesticides, steel, cement, electricity, water, fuel, etc , and services like those of a doctor, teacher, postman, etc , and not paper currency. These things have to be produced or generated before we can distribute them. Of course, a more equitable system of distribution is required to motivate the working people to produce more.

Need for Higher Productivity

Productivity is the ratio between output in the form of goods and services produced and the input of resources in the form of manpower, materials, machinery, etc. Since materials, machinery, etc , are produced by men, manpower is the only basic resource, we utilise in this conversion process. With this available basic resource, we have to produce more goods and services if we want to improve our standard of living. Though we tend to believe that we have plenty of human resources, it is not true. We have plenty of men but not manpower. If these men have to be economically useful, they have to be trained and developed in technological and managerial skills and then put to productive employment. It is disappointing that in this country of teeming millions, we are encountering acute shortage in these skills. Is it not evident from the facts that we are importing sophisticated machinery, equipment and know how from abroad, that we are grossly under-utilising and mismanaging the production capacity we have created and that our productivity levels are pitiably low as compared to advanced countries?

Since the value of goods and services produced by an Indian is only a fraction of what is produced by his counterpart in advanced countries, our income (wages and salaries) and other benefits which have to be per force less than the per capita product can be only a fraction of what foreigners [illegible] In turn, this low wage/income delu[des] us to believe that Indian manpo[wer] is cheap while, in fact, it is [the] costliest. Only those who hav[e] vested interest in keeping our [in]come low will propagate the m[yth] that Indian manpower is che[ap]. We use five/six men on jobs wh[ere] other countries use only one ha[nd]. This basic fact should be borne [in] mind even when we adopt inter[me]diate, labour-intensive technolog[y] as a transitional strategy, in [the] context of widespread unempl[oy]ment.

Higher income can be attai[ned] only when we have more goo[ds] and services for consumption, high[er] consumption will be possible o[nly] when we produce more goods a[nd] services.

Poverty and Unemployment

Greater production of goods a[nd] services by each man and wom[an] in the shortest possible time us[ing] available resources (which is wh[at] higher productivity means) is t[he] need of the hour. The unutilis[ed] potentialities of the employed ha[ve] to be tapped and the idle capaci[ty] of the unemployed have to be pres[sed] into productive work to build o[ur] economic future. For increasi[ng] productivity, only two courses [of] action are available (i) increasi[ng] the number of men working (em[]ploying the unemployed) and ([ii]) increasing the per capita output [of] the working men (i.e higher pr[o]ductivity). To provide producti[ve] employment to the unemployed mo[re] investment is needed. This inves[t]ment has to come out of the surpl[us] of production over consumptio[n] which automatically means that w[e] should produce more than wh[at] we consume. That is, the value [of] the contribution of our work shou[ld] be more than our income. This su[r]plus would only enable the nation [to] employ the unemployed. The fee[l]ing that each one of us has to d[o] less work so that there will be som[e] work left to employ the unemploye[d] is mythical and self-defeating. I[n]crease in the productivity of eac[h] of us will only enhance empl[o]yment, growth and development

---

Shri Warriar is Senior Professor, Indian Institute of Management, Bangalore.

Savings, Investment and Growth

Capital is nothing but the saving of surplus of production over consumption. It is wrong to assume that capital is required to increase production and productivity. on the contrary increased productivity only creates capital In an under-developed country since usually the surplus of production over consumption will be low, savings will be low and consequently investment rate will be low. To the extent wage incomes are consumption-oriented rather than savings-oriented, rise in wage levels signified a corresponding diversion of a portion of the total national product from savings and investment to consumption (para 15 28 of the Report of the National Comission on Labour) Under such conditions, to achieve a fast rate of growth, investment rate has to be boosted up by concerned efforts from low levels to higher levels

Production and Consumption

Such an increase in the investment rate involves not only production of more goods and services or an increase in per capita income, it also means that the increases in consumption should be less than proportional to the increase in per capita income It is because of this that sometimes consumption is intentionally restricted in some countries during the process of growth and until ample capacity for production is established. consumer demands are not allowed to this problem of keeping production above consumption They encourage consumers to want more and more goods and services and to work hard to satisfy these needs. The hard work put in by these people and the resultant higher production of goods and services always precede the satisfaction of needs, i e higher consumption. Under both these systems the rise in wages, salaries and individual gains will be less than the increase in productivity or the former will lag behind the latter Unless it is so, incomes generated will be completely used up for consumption and no surplus will be left for reinvestment which alone can contribute to further growth

Foreign financial aid will not solve the problem for us since, at some point of time, we have to generate the wealth to pay back this money. Considerable amounts of money have been spent on non-productive projects, public administration, community services and so on which generate no corresponding wealth, at least in the immediate future. The investment in many projects with long gestation periods have introduced a wide gap between the expenditure of money and the production of goods and services with the result that corresponding to the money available with public, more goods and services are not available, thus contributing to inflation. The capital invested earlier in many public sector undertakings have not produced any commensurate returns. Deficit financing and inflationary policies have so boosted up the cost of production that the prices have skyrocketed

Stagflation

Inflation is nothing but the process of too much money chasing too few goods When we tried to control the money circulation through measures like compulsory deposit of additional emoluments, ceiling of dividends, etc, it was found that these measures were not very effective since they encompassed only a small sector of the economy In the peculiar economic situation in which we are at the moment, the official data regarding income (collected, compiled and published by the Government) do not reflect the complete picture The parallel economy of unaccounted money (hoarded and bidden goods as well as services that are utilised for the operation of this economy) will not naturally come within the purview of any controls instituted by the Government through the implementation of a policy like this Drastic steps like demonetisation are called for if this problem is to be tackled One does not see why we are shying away from this direly needed step? In our underdeveloped (or developing) economy income from self-employment (agriculture and small business) will be about 65-70 % and wage/salary income as well as property income will constitute only 15-20% each or even less The large sector of incomes from self-employment is not amenable to effect control by the Government. In the case of property income it is more difficult to control rent than interest and dividends When three-fourths of the economy is out of these control measures, naturally the desired results could not be achieved. The manifestations of economic stagnation which resulted from the measures prompted our creative brains to innovate the new concept of stagflation (stagnation along, with inflation). Underutilisation of capacity, creation of scarcity and profiteering from these conditions of soaring prices are particularly preferred hunting ground for our trader-turned industrialists, defeating the normal market response of earning profit through making more supplies when demand is strong. The wage/salary-earning working people are the worst victims of such a tide of inflation since their real remuneration is eroded much more than those of other sections.

Holding the Price Line

It is widely believed that manpower is cheap in India. This is not only incorrect but the converse is true. Otherwise how is it that Japan buys Indian iron ore from Goa, transports it all the way to Japan, converts it into steel, fabricates it into finished goods, transports products all the way back to India and sells here at a lower price than the price of goods manufactured here. Indian manpower is one of the costliest in the world. Take any product and and see what is the cost of manpower per unit of production. If the price of goods and services have to be reasonable and stable, the cost of the resources used have to be less than the value of the output by a reasonable margin. Since manpower (muscle power plus brain power—manual plus intellectual labour) is the basic resource that creates all other resources like materials, machinery, etc, the relation between the value of the output and the input of manpower in the various sectors of the economy will ultimately determine the price level. In other words, human productivity is the deciding factor in holding the price line If work is more efficient and productive the prices will be reasonable and stable.

Linking Incomes and Prices to Productivity

Concrete efforts to increase human productivity and to link prices and incomes to productivity should form the core of the income policy. While unfettered interplay of social forces unrelated to repercussions on costs, consumer and public interests and widening income disparities between organised and unorganised sectors of the economy will not be conducive to our economic development, arbitrary freezing of wages and incomes or straight-jacket application of rigid formulae imposing uniformity of wage/incomes among

the various sectors, whether public or private, unrelated to the productivity of the unit will be counter-productive in positively promoting higher production of goods and services bringing down unit costs and increasing the living standards of people. Systems of material and moral incentives will facilitate achievement of higher levels of productivity. Collective agreements between management and trade unions concluded under productivity guidelines evolved in the overall national interests in consultation with the industry and labour will be helpful to promote economic growth. Since real wages of industrial workers have been stagnating inspite of substantial increases in productivity;(NCL Report) workers will only benefit from such a linking of wages to productivity.

A permanent National Board for Productivity, Incomes and Prices consisting of professional experts should be set up to keep a watch on the health of the economy, review changes in productivity incomes and prices and to issue guidelines for regulating incomes and prices based on productivity. The Government should evolve policies on productivity, incomes and prices, draw up criteria for regulating incomes and prices and issue them to the Board to administer The outline of such a policy is indicated in the Annexure

We too Can do it

Our productivity compared to that in advanced countries is (i) 1/3 in textiles and steel(ii) 1/7 in cement and aluminium (iii) 1/12 in aircraft and (iv) 1/18 in sugar industries Since most of the manufactured goods have several stages of production/distribution like (a) the primary stage of cultivation of raw materials or extraction of minerals (b) the secondary stage of industrial production or conversion and (c)/ the tertiary stage of transportation distribution and servicing the average productivity of 1/4 at each of these stages gets transformed into 1/16 productivity at the subsequent stage and results in 1/64 productivity for the manufactured product due to multiplier effect. This is why the ratio of the national income (total value of goods and services produced) in India when compared to advanced countries come only to 1/66 ($ 70 in India compared to $ 4,600 in USA). From the same analysis it is evident that if the productivity in each sector of the economy increases from 1/4 to 1/3 to 1/2 to 1 the national income will close the gap at a fast rate from 1/64 to 1/27 to 1/8 to 1 due to the same multiplier effect. When the productivity in each sector increases in arithmetic progression, the national income will increase in geometric progression. This also indicates that bringing down the gap in national income with advanced countries is not a hopeless exercise. Since we have seen in several stray industrial examples in India four or fivefold increase of productivity and even closing up the gap between India and advanced countries, it is evident that we can reach the level of their national income by increasing unit level productivity.

New Values, Attitudes and Methods

The widespread belief that the factors contributing to our low productivity is technological is not correct; the real causative factors are human. If we have to achieve higher productivity, an array of national characteristics, traditional values, deep rooted beliefs, patterns of behaviour, attitudes of mind, approaches to problems, work habits and job methods which are at the root of low productivity have to undergo a drastic change. What is characteristic of higher productivity achieved in advanced countries is the higher level of application of methods and techniques which are known to us also, not necessarily the application of more modern sophisticated methods and techniques with which we are unfamiliar—as is widely believed The gap between profession and practice is no where so wide as in India for which also the reasons are mainly attitudinal and behavioural Industrial managers and trade union leaders have a cardinal role to play in bringing about these changes. A productivity oriented policy of managing the human resource has to be evolved and implemented by them

The strategy to increase productivity in India will have to be designed to suit our past tradition and present conditions. Don't we have positive characteristics in our national tradition? The premium attached to moral values above material prosperity in our culture can be a very great asset, if we can motivate men to work harder, even when the rewards are less than proportionate. Have our people not sacrificed everything for fighting for national freedom?

India has to evolve its own path of economic development through self-reliance to motivate its great human assets, to utilise the considerable productive capacity already created, develop much more industrial strength, to create entrepreneurial spirit among men and to harness the vast potentialities of its material resources. We have to cast aside our inertia and change faster if we have to survive as a nation We should evolve new characteristics and methods of work best suited to the genius of India that will enable us to do better, to be more productive and to be real Karma Yogi's India has to awake and achieve excellence in productive performance This is the greatest challenge before the professions and intelligentsia in India today

Annexure

Outline of a Productivity Income and Price Policy

I Objectives

1. to achieve rapid increase in the production of goods and services for creating more employment opportunities for the unemployed and rise in real income for the working people.

2 to keep increases in money incomes below the level of increases in real output for creating surplus for reinvestment and development.

3. to maintain stable price levels and to lower them if possible

4. to maintain the strength of the currency

5 to increase exports and to reduce imports and maintain healthy balance of payments position

II Action Plan

1. drive for increased productivity more vigorous standards of performance at all levels, control of wasteful work practices and introduction of earnings—related benefits in all sectors of the economy with the co-operation of all concerned including political parties and trade unions.

2. higher investment in selected productive projects in various sectors on a priority basis (e g management of water resources for irrigation and power, strengthening basic industries, modernisation of traditional industry, starting agro-based rural industries etc).

3. formation of human capital through training and development in the

skills required for modern industrial society (e.g. entrepreneurial talent, management competence, trade skills, etc)

4. accelerated applied and functional Research and Development efforts including imaginative copying to reduce imports and promote faster economic development.

5 better financial management, cost control procedures and avoidance of waste to improve price levels and boost up exports.

6. keep under review the general movements of productivity, incomes and prices in general and profits and wages in particular, vis-a-vis larger national economic interests.

III General Considerations Regarding Productivity Income and Prices

1 Increases in money incomes and pricing policy of individual enterprises should conform to the objectives set forth earlier and the national interests outlined below.

2 The percentage increase in money income should be less than the average annual rate of growth in output, the latter figures will be the productivity guideline or norm for wage negotiations generally. Any deviation from this should be specifically approved by the Government based on a study by the NBPIP.

3 In applying the above norm to increases in income, adjustment has to be made for increases in costs due to reduction in working hours, improved welfare amenities, etc

4 Exceptional increases in income above the norm should be confined to (i) units where productivity increase has been exceptionally high (ii) where it is essential in the national interest to offer attractive terms to some occupational groups or (iii) where there is widespread recognition that the pay of a certain group has fallen seriously out of line with the level of remuneration for similar work and needs to be improved in the national interest.

5. Exceptional increases outlined above should be balanced by lower than average increases to other groups to keep the increases in income over the economy as a whole within the norm

6. Increases in profits should arise from increased efficiency and reduction of costs.

7. The average rate of increase of income from dividends should not be more than the average rate of increase in labour incomes.

8. Prices should be competitive.

9 Prices should not be raised except when (i) there are unavoidable increases in non-labour costs per unit of output which cannot be offset by reduction of other costs or return on investment (ii) Productivity cannot be increased or non-labour costs or return on investment cannot be reduced to cover wage increases according to the norms or (iii) there is no other way to forn capital needed.

10. Prices should be reduced i (i) productivity increases above th norm (ii) prices of material fuel services or capital costs fall or (iii large profits occur due to excessiv market power.

A Review Article

THE INDIAN POLITICAL SCENE

SANUJIT GHOSE

THE PRESENT study, related to quantitative enquiries on the election results in India, grew from a small beginning. The almost chance-coming together of a British student of Indian Politics and an Indian Economist-statistician with an interest in his country's public affairs. Prof Morris-Jones was no new hand in Indian political scene. He was invited to serve as Earl Mountbatten's constitutional advisor at the time of transfer of power in 1947. He had visited the country a number of times since then. Dr. Dasgupta taught econometrics in UK for about a decade and authored two pioneer studies, including one on the Naxalite Movement. Thus, the authors had the necessary background and the tools to take up such an extensive study covering the electoral data for 1952, 1957, 1962 and 1967, especially the last three The study was not aimed at an up-to-date history but rather at determining the method of analysis; for this purpose the run of 1952-67 furnished a sufficient series This period showed a fairly stable span so far as political relations and patterns were concerned.

The concentration of the present enquiry is on three aspects of Indian electoral politics, which are of exceptional importance; participation, competition and institutionalization A democracy is good because and, insofar as it is participatory democracy. Participation, however, is relevant not only as a democratic norm but also in many cases as a measure of the strength of the political system. India's party system has been described as at once 'one party dominant' and 'open'. In this situation much depends on degrees of opposition unity—and on measures of competitiveness. Competitiveness is of course, also a facet of participation, that of the candidates or aspiring politicians. The term institutionalization may be quite new, but, the phenomenon, and even the concept, are as old as political experience and reflection. With the birth of new states, if there are institutions which have been inherited, they have to be adapted; if for certain purposes, there are no institutions, they have to be created. The election mechanism is itself an institution but the focus of attention here is that which relates to the political organisation of the voters. Thus, the study seeks in a number of ways to ssess how far there are patterns and trends in this respect, how far there is movement towards the exercise of choice which cannot be arbitrary and directionless but consistent, meaningful and effective

While elucidating the states and the parties, the authors recall that drama is a presentation of human interaction, and politics can be presented as one type of drama While narrating the classification of parties, the states are divided as, (a) leading nationalist zones, like Bihar, Haryana, Maharashtra, Tamil Nadu, Uttar Pradesh, West Bengal, (b) 'mixed' areas, like, Andhra Pradesh, Assam, Gujarat, Punjab, (c) areas largely based on former Princely states, like, Kerala, Madhya Pradesh, Mysore, Orissa, Rajasthan A political typology of the tates is at once the most relevant but also the most dificult to attempt, for the criteria could be several

The important consideration in Indian politics is that the notion of a 'left' to 'right' range has to be used with caution If, we take the parties which are usually labelled 'rightist'—notably, on the all-India scale, Jan Sangh and erstwhile Swatantra Party—it would be generally agreed that we had two kinds of 'right', the one primarily 'nationalist' and the other primarily 'conservative' Most vividly this is exemplified in the virtual absence of rightist parties in West Bengal and the extreme feebleness most of the time of left parties in the states such as, Rajasthan and Madhya Pradesh. If, with all these qualifications we proceed to classify our state scene, we can see that four classes emerge fairly clearly in principle. First, we should seek to identify states in which the all-India parties had predominance The clearest members are Assam, Gujarat, Haryana Maharashtra, Mysore and Uttar Pradesh. A second class can readily be formed to consist of the two states wh Congress Party predominance l for substantial periods collapsed the face of the left pressure: W Bengal and Kerala. Third, we c designate (though less sharply) group of states where Congress Pa predominance had for periods h to bow before challenges comi from one or the other of the 'right sectors of the spectrum. In t group might be placed Madh Pradesh, Orissa and Rajasthan Fina Punjab and Tamil Nadu bel to a box that was off the linear sp trum defined by the loss of Congr Party dominance to regional partie the Akali Dal and the DMK

On top of 62 years as a national movement, Congress Party cou add 30 years as a political party, this long period we can say that t not less than the last half a centu it had been the organisation dom nating the country's political li It was, paradoxically, its good fortu to be locked in the struggle agai British rule for a very long perio that experience enabled it to attr most of India's political talents a then develop them into a great r servoir of skills—of mobilisatio organisation, negotiation and co promise This monopoly, based a combination of merit, charisma leadership and the party's own ima as a winner of freedom for t country, was so nearly complete t a large part of the opposition, wh eventually developed, received political education, in a way, wit Congress Party; in a certain me sure Congress Party moulded n only its followers along but al its opponents. Thus, two opposi changes took place on the one han the difference of interests and o nion became more glaring as t Congress Party became responsil for shaping and implementing gover ment policies; on the other hand, had larger benefits and rewards distribute. While one tendency forc elements to leave, the other impel some to join. (If some would d cribe this as the replacement romantic nationalism by normal p tics, others would say that ideal went out while opportunists came i

Of the parties on the left, t Communists were the first to achi organisational identity. With t

Patterns and Trends in Indian Politics : ***An ecological analysis of aggregate data on society and elections; by Biplab Dasgupta and W.H. Morris-Jones; Published by Allied Publishers Private Ltd; Price Rs. 65.***

Books

great rift in 1964, the direction was not uniform over the country. The CPI(M) emerged in significant numbers only in the three areas of general communist strength, West Bengal, Kerala and Andhra Pradesh. The CPI was present in these states but relatively weak; on the other hand, it had a much better all-India spread. At the same time, CPI(M) ran into fresh difficulties when from its left side was spawned a further series of breakaways which came to form CPI(ML).

In the measuring exercise, the authors ascertained the degree of association between two sets of variables one was electoral and drawn from the official statistics of voting the other was the socio-economic and was derived from the census data of India in 1961 There were, of course, several problems to begin with. The initial problem was the selection of appropriate unit of area The electoral data was naturally arrived at in the form of figures for constitutencies which were those used for election to either the state assemblies or Parliament The census information, on the other hand, was available at the level of either state or district or subdivision of district The problem was to find an area which, while yielding a sufficient number of units of observation for statistical workings, would permit the bringing together of the two sets of data with least difficulty The best unit was that which combined the merits of substantial number, ease of data conversions and stability over time Thus, the choice fell on the district

Based on district-wise data on 24 socio-economic variables and many political variables covering four elections of 294 districts (for the sake of uniformity in comparison, as already explained), this is an exciting study on Indian politics in terms of such factors as literacy, urbanisation, social pluralism, land scarcity and past electoral behaviour The summary of findings indicate some interesting conclusions, like, high degree of consistency in the territorial distribution of participation, close correspondence between the level of development of a district and its voting turn-out, the Communist vote is relatively higher in developed areas, the opposite is the case with Jan Sangh. It is also interesting that more than two-thirds of the 'Strong Jan Sangh' districts also happen to be 'weak Communist' districts, which is consistent with their diametrically opposed political position A detailed examination of state-wise results showed that Bihar and UP were clearly 'multi-party' states; Andhra Pradesh, Assam, Maharashtra and Mysore were one party states (or one party dominant states); and eight states—Gujarat Kerala, Madhya Pradesh, Orissa Punjab, Rajasthan, Tamil Nadu and, West Bengal suggest two party situations (that is, two parties receiving 60 per cent or more in aggregate, the difference between the two being less than 20 per cent, with no other party receiving more than 15 per cent of votes).

As the authors admirably conclude, such as analysis calls for extension in time. Recent times have shown as to how urgent yet relevant such a study could be if extended to post-1971 election scene in the country. Especially now when for the first time in the history of the country a party other than the Congress Party i e. the Janata Party is dominating the Indian political scene. With a good number of analytical tables in each chapter, a survey of quantitative methods and an index at the end, this book would not only excite scholars and political practitioners, but even the common reader would find it quite interesting to go through. □

All About Social Change

Dimensions of Social Change in India *by M N Srinivas et al (eds), Allied Publishers Pvt Ltd New Delhi, 1977, Pages* 111+518, *Price Rs* 60

THE STUDY of social change in India has been a continuous preoccupation among academics as well as Government departments from different angles during the last two decades. Sociologists have been foremost in studying social mobility of our stratified society that has manifested itself in such diverse fields as political development, religion, family structure and institutions. Few things highlight the transformation of the society as the processes of rural and urban development under the impetus of economic planning through various programmes and projects. Political events of the recent past are also best understood in the light of sociological interpretations based on their synthesis.

The present volume containing contributions from 27 scholars is the edited proceedings of a National Seminar organised by the Institute for Social and Economic Change, Bangalore in 1972 with the cooperation of I.C S S R and I A S., Simla. The editors have, apart from giving a good introduction to the proceedings, ably arranged the valuable papers under 8 headings viz.: (i) concepts and methods; (ii) mobility and stratification; (iii) religion and change; (iv) tribes and change; (iv) rural social change; (vi) family, socialisation and change; (vii) communications and change; and (viii) new institution building. The relevance of the papers extend over larger areas of interest than what their titles indicate Notable contributions are those by Rajgopalan, Yogendra Singh, Roy Burman, Oomen and Yogesh Atal. There is a good deal of insight in some of these papers which, however, hang loose in the total context. The authors are mostly well-known in their respective areas of research (sociology, social anthropology, economics, human geography and political science) In some cases they are also noted for their original contributions in inter-disciplinary field.

The presentation of papers in the Seminar had evidently taken place leaving the deliberations and the drawing of conclusions open-ended. One wonders whether the fads of the Indian School of Functionalism have reached their tether end! Apparently, Indian sociologists either in their organised bodies or in the midst of scholars of other disciplines are chary of discussing the pros and cons of sociological planning in India The system-functional concept of planning too has not made much headway although this is very much in vogue abroad. There is a certain degree of fear that is also noticeable about the future of the profession, possibly on account of impoverishment that is in store, if the present trends are doggedly maintained. Perhaps, the

absence of clear concepts of sociological planning on the one hand and the desire to reorganise the man-made ennvironment in India with its cultural landscape on the other are the factors at the root of the problem.

There is, perhaps, no more of any sort of crisis of relevance in the disciplines of sociology in India to the extent to which fears have been expressed before. The crutches of Western social theory are still there and those who want to discard them have been the butt of criticism amongst the profession in India. A perusal of the volume is apt to convince the reader as to how varied are the facets of thought underlying the papers and what makes the task of formulating sociological theo under Indian conditions so v difficult.

The Editors have dedicated attractively produced volume to memory of professor A.R. Wa (1888-1971) a pioneer in the de lopment of sociological studies India.

Contours of Cooperation

Contours of Indo-Soviet Economic Cooperation *by Girish Mishra; Published My Allied Publishers, New Delhi; Pages* 152; *Price Rs* 25.

THE FIRST inter-governmental economic agreement between India and the Soviet Union signed 22 years, on February 2,1955 The conclusion of this agreement laid the foundation-stone for the rapid and steady growth of mutually beneficial economic ties between the two countries At present about 80 projects embracing various fields of economy so vital for the country's industrialisation and progress, are under construction in India with the economic and financial assistance of the Soviet Union. A number of these projects have already been put into operation

Indo-Soviet economic relations have played a major role in the country's economic development since early 1950s. "Thanks to economic cooperation with the Soviet Union", Girish Mishra says, "India now possesses a strong public sector and a whole range of basic heavy industries. This cooperation encompasses a large number of activities from steel to agriculture, oil refining and exploration, shipping, drugs, technical training and designing, etc"

The book is divided into 11 chapters. The first two chapters focus attention on the 25th CPSU Congress and 10th Five-Year Plan of the USSR from the point of view of assessing the prospects of further development of economic relations between the two countries. It has been the continuous endeavours of the CPSU to forge and strengthen ties of friendship and cooperation with India

The chapter "Indo-Soviet Trade" discusses the growing volume of trade turnover which has gone up from 1.3 crores in 1953 to Rs 700 crores in 1975 and its diversification over the decades. The next chapter throws light on economic cooperation between the two countries and India's industrial development. The Soviet Union has provided credit to the tune of Rs. 10,220 million for various projects. About 99.13 per cent of the Soviet aid has gone to public sector projects This shows the qualitative difference berween the Soviet aid and the Western aid of which 25 per cent has gone to finance the import of foodgrains and consumer goods. Other chapters are on cooperation between the two countries in agriculture, communication, economic planning, defence and science

In the book Girish Mishra presents a comprehensive survey of the economic relations between the two countries from 1953 onwards. author has discussed all facets economic relations between India the Soviet Union with great cla supported by adequate facts data

Girish Mishra also discusses innovations made by the econo relations between the two countr These innovations include the syst of rupee-payment and producti cooperation.

The book has been written lucid style and simple language nicely-produced book, it meets needs of those who interested in the study of In Soviet relations.

—Pritam

The Faces of Sun God

Surya—The Sun God: *by Mrs Shakti M. Gupta, Published by Somaiya Publications Pvt Ltd Bombay, Pages* 71, *Rs*. 55

SURYA, the Vedic god of light is gloriously pictured as riding e golden chariot that traverses the sky with a watchful eye observing the good and bad deeds of both mortals and immortals. The twelve Adityas in various important aspects of the deity make the study of Surya an important cult complex The bringing together of Surya, Vishnu, Brahma and Shiva identifies him with the concept of the Trinity itself The description of the three Vedas as Surya, the solar orb, the musical lines of the Sama-Veda, and the personified deity in the blazing flame of the hymns of the Yajur-Veda illustrate the three Vedas as shedding solar light

In ancient India, the worship of Sun was a great cult in itself. It was Sankara who brought together various warring cults and created a a synthesis in the Panchayatana. Famous temples were built for Aditya at Martanda in Kashmir in the north, at Konarak in Orissa in the East, and Modhera in the West.

From Kashmir to Kanyakumari every devout Hindu bows in obeisance to the rising Surya and offers his prayers and thanks for the gifts the almighty Surya bestows on h manity Not a flower can flow not a soul can stir, not a river flow but for the magnanimity the mighty Surya And Surya his wrath parches fertile fields, su dry man and material, perva the darkness within and witho Such are the blessings and the cur of the great Surya. Said Krish in the Gita: "That splendour issu from the Sun that enlighteneth whole world, that which is in t moon and in fire, that splando know as from Me"

The author has studied the the elaborately from every point of vie She has traced the origin of t concept from Vedic times, discuss the antiquity of Sun worship fro historical records and inscriptior the truth of the belief that Su bestows health, the iconograpl form of Surya, the famous templ associated with the Sun-God, t various deities associated with hi as well as his consorts and attendant his place among the planets h importance in composite figures a so forth, making it a very valuab contribution to the solar symbol ar its deity in India.

The book has adequate illustratio which will assist the reader and he him in getting some background Surya.

—Nitish S. Re

Development Notes

New BHEL Plants Will Save Foreign Exchange

The country will save nearly Rs 65 crore in foreign exchange annually when two new manufacturing plants of the Bharat Heavy Electricals Limited (BHEL) - one at Hardwar and the other at Tiruchirapalli - reach full production. The central foundry forge plant, being set up with French collaboration at Hardwar, will manufacture sophisticated castings and forgings to meet not only the requirements of BHEL but also nuclear defence, ship building, steel and allied industries. To manufacture power plants BHEL has been importing Rs 19 crore worth of castings and forgings every year from developed countries like Russia, US, Japan, UK, France and West Germany.

The stainless steel tube plant, coming up at Tiruchirapalli is expected to save about Rs 45 crore per annum in foreign exchange. The plant will manufacture 40,000 tonnes of boiler quality tubes annually, in sizes ranging from 14 mm to 159 mm. Of the total production, 65 per cent will be consumed by the high pressure boiler plant of BHEL at Tiruchi and the balance will be supplied to other boiler makers within the country. The Hardwar plant which involves a capital investment of Rs 34.20 crore will ultimately produce 6,500 tonnes of steel castings, 3,250 tonnes of steel forgings and 4,000 tonnes of billets and blooms annually.

Saudi Loan for Power Projects

An agreement covering the first ever loan to India from the Saudi Arabian Fund for Development to the tune of $ 100 million has been signed in New Delhi. The loan will finance the Srisailam and Nagarjunasagar power projects in Andhra Pradesh. The Saudi Fund was created in October 1974 after the oil crisis with an authorised capital of three billion dollars to assist developing countries groaning under the crushing blow caused by the oil price hike.

The Srisailam project envisages the erection of four 110-Megawatt power generation units with provision for another three later at a total cost of Rs 208 crores. The first unit is expected to be commissioned in March 1979, the second, third and fourth in October 1979, March 1980 and October 1980. The Nagarjunasagar project, which is due for commisioning in August this year will cost Rs 15.60 crore. During 1976-77, a sum of Rs. 6.26 crore was spent on this project. The Saudi Fund will take into account the entire expenditure incurred on the project from April 1, 1976, till its completion, which may amount to Rs. 12.97 crores.

World Bank Loan for Irrigation Project

The World Bank has sanctioned a loan of seven million dollars (about Rs 6 crores) to Assam for undertaking irrigation and research and extension on agricultural development in the State. The loan will bear an interest of six per cent payable in 10 years. The scheme is divided into two parts: irrigation, to change the cropping pattern in the State mainly in the flood prone districts and research and extension. Seventy per cent of the total expenditure will go for irrigation, 20 per cent for extension and 10 per cent for research.

The irrigation scheme aims at changing the cropping pattern in the districts of Goalpara, Kamrup and Nowgong. It will provide enough irrigational facilities so that crops can be raised during winter months and saved from devastation of flood. Irrigation will include sinking of shallow and deep tubewells, lift irrigation and digging of canals. The scheme, known as "Quick Maturing Agriculture Scheme", is expected to be completed in three years time. The World Bank experts will supervise the progress of the scheme and give necessary guidance and advice.

People's Housing Programme

The Karnataka Government has sanctioned a sum of Rs 4.81 crores for construction of houses and huts in the State under the People's Housing Programme during the current year. Each taluk will get Rs 2,75,000 under the scheme. Fifty per cent of this amount has been released for taking up the construction and the other 50 per cent will be made available in due course. The Deputy Commissioners have been empowered to select the number of beneficiaries in various taluks, out of the three schemes now under operation in the State, depending upon the response from the beneficiaries and the local conditions. The choice about the type of houses will be left to the beneficiaries.

The State Government is providing financial assistance to housing programmes under three categories. Under the normal People's Housing Scheme, the total cost of a house is Rs 2,500 of which the beneficiary has to contribute Rs 500 in the form of cash, kind or labour. About 75,000 houses have been sanctioned up to the end of 1976-77 under the scheme under different series and of them 62,331 houses were completed upto the end of March 1977. The construction of the remaining houses is progressing.

The Experimental Low Cost Housing Scheme was launched during 1976-77. Under this, 8,750 houses were sanctioned with a subsidy of Rs. 1,250 each upto the end of March 1977 and 4,430 houses were completed. The third scheme relates to the construction of huts. Wooden material worth Rs 250 a hut would be supplied for construction, on an experimental basis. As many as 10,044 houses were completed during 1976-77.

Regd. No. D(D)-152

Industrial Complexes in Private Sector

Twentyfive industrial complexes mostly in the private sector, would be set up in Kerala in the current financial year. Investment in each unit would be between Rs 30 and Rs 50 lakhs The locations, though not yet decided, would depend upon the availability of raw materials. The products of a large number of these complexes would be export-oriented. Some would be ancillary products.

A technical team would be entrusted with the task of selecting the entrepreneurs, location of the site and construction of the complex The export-oriented products that could be manufactured by these units, will include leather goods, garments, building material and paints. There were good markets for these in Gulf countries The Industries Department has prepared a scheme to start industrial townships in the district headquarters Some municipalities had already started acquiring the necessary lands for the purpose

IDA Credit for Irrigation System

The International Development Association (IDA) an affiliate of the World Bank, is extending a credit of $ 23 millions (Rs. 20 70 crores) to help finance rehabilitation modernisation and extension of an irrigation system in Tamilnadu The $ 46 million project is designed to minimise water losses in conveyance and operation of the Periyar-Vaigai irrigation system in Tamilnadu. Water savings will be used to introduce double irrigation for the first new areas, presently rainfed, under irrigation for the first time At full development the project is expected to increase annual rice production by about 60,000 tonnes, resulting in net foreign exchange saving of $ 9 6 millions. The project will also generate about 10,000 man years of agricultural employment

Export Corporation Business Doubles

The toal turn-over of the Uttar Pradesh Export Corporation more than doubled during 1976-77 as compared to the year 1975-76 Its export sales went up by 130 3 per cent and internal by 17 3 per cent The Corporation registered a turnover of Rs 312.19 lakhs during 1976-77, as compared to Rs 154 76 lakhs in 1975-76 and increased its profits from Rs. 2.93 lakhs to Rs 4 lakhs. The Corporation also set up 21 carpet weaving training centres, costing Rs. 20.44 lakhs, a readymade garment complex, costing Rs. 31.18 lakhs at Loni, during 1976-77 and incurred an expenditure of Rs 140 lakhs, as project cost, on the carpet yarn spinning mill at Bhadohi

The Corporation will hold a buyer-seller meet at Muscat and Abu Dhabi, to explore export markets in West Asia Some of the items for which export market would be explored are engineering items, building materials, leather goods, handicrafts and food products

Substantial Rise in Handloom Exports

There has been a 24 per cent increase in the exports of handloom goods, both cotton and non-cotton, during the financial year ended March 1977, as compared with those for the financial year ended March 1976 According to provisional figures available, exports for 1976-77 at Rs. 241 crores show a rise of Rs 46 crores over Rs. 195 crores achieved in 1975-76. Exports of cotton handloom fabrics during April 1976 to March 1977 have gone up by 22 per cent to Rs. 47 98 crores from Rs 39 35 crores in the corresponding previous period, following the increase in terms of quantity to 66 million metres from 58 15 million metres previously

Exports of cotton handloom made-ups during 1976-77 are higher at Rs 19.54 crores against Rs 13 28 crores in 1975-76 Likewise, exports of cotton handloom readymade garments are reported to have gone up to Rs 150 crores from Rs 123 50 crores. The trend in the export of other important cotton handloom fabrics and materials like real Madras handkerchiefs, lungies, cotton floor-coverings and bedspreads is also quite encouraging.

Meteorological Centre For Punjab

A new meteorological centre is being set up in the Punjab by the Indian Meteorological Department. The Centre will be equipped with telecommunication facilities for speedy collection and dissemination of meteorological data, forecasts and warnings and will have close link with the Punjab Agricultural University for effective utilisation of weather information for the agriculture of the State.

At present weather forecast for Punjab is prepared in New Delhi and since there is no telecommunication link between the forecasting office and the AIR Jullundur or PAU, the weather information does not reach the farmers in time.

The PAU has a group of trained scientists to advise the farmers on the weather-oriented farm operations This group which includes crop ecologists, irrigation specialists, agrometeorologists, crop specialists, entomologists and epidiomologists will interpret the weather data for its application to farm operations. This will thus provide a weather advisory service to the agriculture of the State well in advance.

Dramatic Rise in Foreign Exchange Reserves

India's foreign exchange reserves have spurted dramatically in the new financial year, and have now hit the $ 4,000 million mark. Between April 15 and May 27, the reserves shot up by Rs. 413 crores, giving an average rate of almost Rs. 70 crores per week. Thus the country's foreign exchange holdings have increased in the six weeks by almost as much as they did to the previous four months. In spite of considerable liberalisation of import licensing the country is enjoying a favourable trade balance To this has to be added an inflow of invisibles which have now increased to almost Rs. 150 crores per month, or Rs 1,800 crores per year. Over and above this the country will be receiving an estimated Rs. 876 crores this year as net foreign aid.

NUC5C4(R)

Yet as late as 1900, people disputed and debated the reality of the atom. The great philosopher Ernst Mach in Vienna felt there was not a grain of truth in the theory. The noted chemist Wilhelm Ostwalt rejected the concept. And yet, one man at the turn of the century defended the reality of the atom. He was Ludwig Boltzmann. Had anti-atomic doctrines won the day, our advance in physics and biology would have been set back by perhaps a hundred years. Boltzmann launched a passionate struggle to proclaim the truth on fundamental grounds of theory. In 1906, at the very moment when the atomic doctrine was going to win, he thought all was lost and committed suicide. But his immortal formula remained. And today the atom releases a world of energy for mankind.

Development of technology makes it possible to tap that energy. We at L&T have spent an entire decade generating a rich reservoir of nuclear fabrication technology, preparing for the great moment when we would fabricate critical equipment for India's nuclear power projects—a moment like the one when we recently handed over the nuclear reactor calandria to Madras Atomic Power Project I.

As this moment is linked with other similar ones in the past, L&T peers into the future and continues to plan the progress of nuclear technology. After all, the atom holds within itself infinite possibilities expressed by the poet William Blake who yearned "to see a world in a grain of sand". Science backed by technology unfolds that world and finds a future for India in atomic power.

Nationwide Economic Census

Dependable statistics constitute an important infrastructure for sound planning. During the last three decades a fairly adequate system of agricultural statistics has been built up, although the system still admits of improvement. The availability of statistics for the non-agricultural sectors of economy like manufacturing, trade, transport, construction and services is not satisfactory. While data are being regularly collected for some organised segments, there is almost complete lack of reliable data on other unorganised segments. For example while data on manufacturing establishments registered under the Factories Act 1948 are being regularly collected under the Annual Survey of Industries, there is no regular collection of dependable statistics for non-factory units, that is manufacturing establishments using power and employing less than 10 persons or those not using power and employing less than 20 persons. There are similar chunks of grey areas in the sectors of trade, road and water, transport, construction and services. Paucity of information in the unorganised segments has led, on the one hand, to the neglect of development planning of these sectors on rational lines and on the other hand, to exaggerated claims in respect of some segments. The importance of these sectors may be realised from the fact that they are estimated to account roughly for about one-fourth of the national income and about one-fifth of the country's labour force. It is clear that they have an important role to play in the country's development.

The scheme

The Government of India is launching in September-November, 1977 a countrywide economic census to ascertain the structure, activity and performance of the unorganised segments of the non-agricultural sectors of economy. This will be followed by sample survey of individual sectors in the next two or three years The scheme will provide information on the distribution of establishments by location and activity and also estimates, at the district levels of the values of inputs and outputs, investments, for the unorganised segments of each major sector of non-agricultural economy.

The proposed economic census, estimated to cost Rs 3.5 crore is of great importance from the point of view of streamling the existing statistical system Previous attempts to organise surveys of small industries, distributive trade, etc., have been partial and sporadic. An integrated economic census is, therefore, an essential step to provide the requisite information for planning, administration and the compilation of national accounts. It will facilitate planning at the state and district levels and the identification of the relatively backward areas in the States. The economic census stands on the same footing as the population and agricultural censuses.

The programme

The work will be carried out according to a phased programme of a census of all non-agricultural establishments in urban and rural areas, followed by sample surveys of selected segments. The census will collect basic information as regards location, management, type of activity, number of persons employed and the nature of goods and services produced. The sample surveys to be conducted at a later stage will seek from the selected establishments of the unorganised segments of the non-agricultural sector, detailed information particularly on the values of inputs, outputs, employment, investment, and the like. It will canvass a fairly large sample of establishments from each sector to provide estimates of reasonable accuracy at the district level.

(Contd. Overleaf)

For the purpose of the economic census, an establishment will be taken to be a unit or a household which undertakes non-agricultural economic activities and employs at least one hired worker on a fairly regular basis. It is estimated that there are about three million such establishments in the country.

The organisation

The overall responsibility for the organisation of the census vests with the Central Statistical Organisation, while the field operations will be the concern of the state statistical bureaus As the census is a large-scale operation spread over the entire rural and urban areas, the part-time services of a large number of field staff will be drawn from State administrations to work under the direct guidance and supervision of the state statistical bureaus for the duration of the census operations For the organisation of the sample surveys in the second phase, the resources of the National Sample Survey Organisation and the associated field services in the state statistical bureaus will be utilised to the largest extent possible. The whole programme is guided by an advisory group comprising representatives of the concerned Central Ministries, a few state governments and other user organisations.

Co-operation from the public

The success of the programme will entirely depend on the information which the respondents give Accurate information will help the establishments participating in the census by drawing attention of the authorities to the areas of concentration of important activities and their problems in improving the organisation It is, thus, essential that every respondent should give whole hearted cooperation in making available the needed information to the best of his ability.

Confidentiality

The information gathered und the scheme will be put to use pure for statistical purposes. The info mation relating to individual ente prises will be kept strictly confide tial and will in no case be accessib to any individual or organisatio private or government, includi tax officials or controlling auth rities

The first phase of the projec namely, the census, will be carri out in September-November, 197 As a prelude to the main census, pilot census was conducted in o district each in 24 States/UTs in Ja uary-February, 1977, with a view gaining the requisite procedura organisational and operational e perience for carrying out the ma census. In the light of the finding the programme for the countr wide census is being formulated

Engineering for Harmony

R. K. SARAF

THE ENVIRONMENT we commonly talk of comprises air, water and soil It is evident that the environment should be maintained congenial enough for a comfortable living. To have a favourable environment, one should have a certain understanding about it.

From time immemorial, human activities for betterment of living standards have been affecting the environment, most of the times adversely. The progress of mankind, ironically enough, is closely associated with environmental degradation A good compromise is possible by way of streamlining human activity in such a manner as will not pollute the environment heavily.

Nature has bestowed upon the environment an immense assimilation and self-purification capacity. As long as the discharges of waste materials do not exceed this capacity, the environment can rejuvenate.

Genesis

While it is not easy to predict the self-purification capacity unmistakably, the best strategy in efficient management of the environment lies in the adequate treatment of waste materials and its controlled discharge to the environment so that it can purify itself. This is precisely the direction in which research and development activities are oriented in the field of environmental engineering

In the year 1955, an epidemic of infectious hepatitis broke out in Delhi It resulted in the morbidity of about 30,000. Investigations of the possible causes led to the revelation that the potential source could be the gross pollution of Jamuna by sewage. It resulted in water almost like a weak sewage being supplied through the water distribution system The episode came as an eye opener and the concept of establishing a national capability to develop knowhow indigenously to prevent recurrence of such incidents gained momentum.

While work in this field was being done in several institutions in the country, it was considered desirable to establish an organisation to undertake R&D activities in this field exclusively. Thus came into being NEERI, the National Environmental Engineering Research Institute (formerly Central Public Health Engineering Research Institute) in the year 1959 at Nagpur, under the Council of Scientific and Industrial Research

While sophisticated methods have been developed for possible use in urban areas, the Institute has always been seized with the special situations encountered while dealing with environmental sanitation in rural areas. Sanitation facilities suitable for rural areas are being introduced through research-cum-demonstration projects in some of the villages around Nagpur as a joint venture with the Zilla Parishad, Nagpur In view of its achievements, NEERI has been recognised as a WHO collaborating centre on community water supply, waste disposal and air pollution control. It has also been selected by the United Nations Environment Programme (UNEP) Nairobi, as a centre for stepping up air and water pollution monitoring activities in the ESCAP region.

Water Treatment

Water, as available in the environment, is a major recipient of waste materials Hence, its quality is required to be updated for human consumption and other usages. In order to tune its quality, water is required to undergo one or more of these unit treatment processes: coagulation, sedimentation, filtration and disinfection. Each of these unit processes has been probed into with a view to improve efficiency, reduce cost and make maximum use of indigenous materials.

A series of coagulant aids have been prepared from locally available materials to reduce alum consumption in water treatment. These have been effective. Savings in alum mean savings in sulphur, an imported constituent that goes into the making of alum.

For on-the-spot disinfection of individual waters, disinfection tablets and chlorine ampoules have been developed. These have been found very useful particularly as emergency measures during floods. To provide a simple mechanism for continuous chlorination of well water, a "chlorine cartridge" made of earthenware pot(s) has been developed. It works effectively for 10 to 15 days in medium sized wells.

In order to assess the effectiveness of the chlorination, a simple pocket kit called "NEERI Chloroscope" has been developed to estimate visually its residual chlorine.

Excessive fluorides in water (permissible level 1 mg/l) have been observed in several areas like Andhra Pradesh, Rajasthan, Maharashtra, Tamil Nadu and Madhya Pradesh. To remove these excessive fluorides, NEERI has developed the "Nalgonda technique". It comprises addition of lime, bleaching powder and alum to fluoride bearing water in sequence and allowing a certain period for flocculation and sedimentation. The process gives a filtrate devoid of the excessive fluorides The process is simple, easy to adopt and very cheap.

Yet another achievement is a finding that high grade bituminous coal can substitute imported anthracite medium in double layer water filtration. Using this indigenous medium, double the output has been obtained without any deterioration in the filtrate quality. It has thus potential applications in the existing overloaded water treatment plants.

A domestic iron and manganese removal unit, a filter aid and membrane filter from indigenous materials are the other important achievements of the institute.

Leak Detection Surveys

Even if the raw water quality is tuned up and supplied for domestic consumption, it does not by itself ensure the safe reach of such water at the consumer's tap. In the comp-

Shri Saraf is Scientist, NEERI, Nagpur.

lex network of water distribution system, several things happen. Through leaks it is reported that up to 40 per cent of the water distributed is lost. In the absence of adequate pressures, the contaminated water outside also can infiltrate into the pipeline. If the wastage through leaks alone is avoided, the urgency of tapping additional water resources for augmentation can be deferred to some extent. This is a very sound consideration for the profession. NEERI has demonstrated in several cities such as Aurangabad, Bombay, Delhi, Lucknow, and Madras the various techniques of preventive maintenance such as leak detection surveys, determination of C-value for pipes and swabbing. This has been welcome as a boon by the civic authorities

Waste Water

Waste water, in its paralance, is a common term for used-up water, domestic sewage and industrial effluents. Waste waters usually terminate into a water body and sometimes on to land. When let out into a water course, the constituents in the waste water tend to consume the dissolved oxygen in the water course for their oxidation This depletion in oxygen level causes the biota to undergo a stress, sometimes die and consequently putrify. Treatment of waste waters aims at reduction of the harmful constituents, so that the ecology of the biota in water course willl rejuvenate.

Usually, physical and chemical processes are also utilised judiciously to get rid of the pollutants in wastewater. Towards waste water treatment, NEERI has assessed the suitability of three low cost waste treatment methods, namely, stabilisation pond, aerated lagoon and oxidation ditch. Compared to conventional treatment methods like trickling filter and activated sludge process requiring sophisticated mechanical equipment and skilled personnel for operations and maintenance, these low cost methods require none of them (except perhaps a motor for driving waste water into the system and a rotor for mechanical aeration and yet there is no compromise on the efficacy of treatment.

These methods, either singly or in combination, are found to be adequate in most of the cases of industrial effluents as well. This has been assessed by the Institute while examining the amenability of several industrial wastes to chemical and biological treatment. The following are some of the examples: synthetic drugs, photofilm, pulp and paper, rayon pulp, strawboard, pharmaceutical, chemical, antibiotic, high explosives, fertiliser, textile, petrochemicals, starch, steel mill, electroplating, distillery, coffee, slaughter house, tanneries, sago and dairy. A number of these plants are functioning well in the country.

The treated effluents are found to support the growth of fishes. Besides fish culture being an economical proposition, this shows that water courses can well receive the treated effluents.

Sewage Farming

NEERI studies on differentially diluted sewage with and without supplementation by NPK have shown that sewage, when diluted with water in ratios of 1 : 0.5 and 1 : 1 and fortified with fertilisers gives a balanced growth of crops and maximum crop yield It also brings about efficient utilisation of sewage nutrients

Towards a fear expressed for using raw sewage for irrigation of vegetables that are eaten raw, NEERI has found it an economical proposition to cultivate essential oil bearing plants like citronella and mentha, the extensive use of which for medicines and cosmetics is presently met through imports

Viruses

Treated waste water effluents, inspite of meeting standards set in terms of physico-chemical, biological and bacteriological parameters can yet contain considerable viral load and hence deserve to be thoroughly disinfected before discharge.

NEERI has developed a modified membrane filter method for detection and enumeration of viruses from wastewater. Further, a new method for concentrating viruses from large volumes of water has also been developed wherein the water is filtered through a bed magnetic iron oxide.

Air Pollution

Although of a relatively recent origin, the problem of air pollution has deserved attention in many pockets of the country. NEERI has set up a national network in nine select cities to monitor common air pollutants such as suspended particulates, carbon monoxide, and oxides of sulphur and nitrogen. It is hoped that the long term data on these air pollution parameters will eventually help in evolv Indian Standards.

On request, industrial premi and environs are surveyed to amel rate air pollution problems, sho they exist. Such surveys are carr out for cities as well. Assistance also rendered in deciding upon lo tions of future industries in vi of the air pollution consideration

Solid Wastes Management

Dumping of city refuse is a co mon sight even in a metropo NEERI has assessed the char teristics of city refuse from as ma as 33 important typical cities. Tl investigation is an important p lude to assess amenability of c refuse to composting and incinei tion. On request, NEERI und takes feasibility studies to sugg alternatives for collection, trar portation and dispsal of solid wast

Biogas

Night soil, cattle dung as well city refuse can be anerobically c gested to yield biogas with ri fuel value In the context of ener crisis, this R & D effort has gre significance. A night soil digest is being operated in the premises Central Jail, Nagpur, using tl night soil from the jail inmate The biogas generated is actual being used for its calorific valu Preliminary trials in deriving biog from city refuse have been e couraging. These studies are bein scaled up further.

Rural Sanitation

Fecal contamination of wate an soil are the major identified reason for poor health and well being c rural communities. A joint ventur by NEERI and Zilla Parishad Nagpur is in progress in ten villa ges around Nagpur to assess th morbidity pattern before and atte providing bare minimum sanita tion facilities

Instrumentation

A regular programme has bee initiated to develop indigenou equipment, wherever feasible Th following are a few examples win speed and direction recorders fo collecting micrometeorological dat useful for air pollution survey work NEERI Chloroscope for estimation of residual chlorine in water; an high volume air sampler and multi gas sampling kit for simultaneou sampling of several gaseous pollu tants. Sophisticated instrument such as ultraviolet, visible infra

Industrial Toxicology

C. R. KRISHNA MURTI

ONE OF THE inevitable consequences of industrial development and modernisation of agriculture is the introduction of a variety of new products including chemicals into an environment hitherto free from them. It is believed that we may have to deal with near about ten thousand such products by the end of this century. Many of these are potentially harmful to human health. Workers in industry are directly in contact with them for prolonged periods and a number of diseases are already being recognized as a result of such occupational exposure The public at large is indirectly exposed to them in their day to day lives. Due to differences in climate, traditional habits, malnutrition and co-existent parasitic infestation, the health hazards posed by these chemicals to the population can assume a pattern altogether different from what has been noticed in industrialized western countries. Here is an area where import of technology is not feasible

The establishment of the Industrial Toxicology Research Centre at Lucknow by the Council of Scientific and Industrial Research in November 1965 owes its origin to the realisation of the need for identifying human diseases and disabilities posed by industrialization and for devising appropriate curative and preventive measures. The youngest in the chain of national laboratories, the Centre is unique insofar as it is the only institution of its kind in South-East Asia.

Industrial Dusts

In the mining and in the processing of ores, in the silicate and asbestos based industries, in the quarrying and building industries, in the textiles, jute and coir industries, our workers are exposed to inorganic or organic dusts which, when inhaled over prolonged periods, cause various lung and respiratory disorders. Workers who carry tubercular or fungal infections are believed to be more susceptible to the toxic action of dusts. In view of this, studies have been made to find out the role of infection and dietary factors in modifying the course of the disease caused by dusts. Techniques for reproducing the human disease in experimental animals have been standardized.

The researches conducted at the Centre on experimental silicosis and asbestosis have indicated that silicic acid solubilized from dust combines with membraneous structures and organelles in the target tissue resulting in a variety of biochemical disturbances eventually leading to excessive deposition of collagen. Experimental studies have provided some clues for devising preventive therapy which need further elucidation before clinical application. *In vitro* models based on cultured animal cells and human red blood cells have been set up to investigate the nature of the toxic action of dust and its relation to the histopathological charges noticed in experimental animals and human victims. Particle size studies have indicated that besides the chemical composition, particle size is of critical significance in determining the course of the disease caused by a given dust. Deposition of the dust in lymph nodes appears to accompany other histological changes and the relevance of this observation to the defence of the individual against dust disease needs further investigation.

A health survey of workers handling hemp has led to the identification of an allergic condition characterized by cough, breathlessness etc A vaccine prepared from hemp and the associate microflora has shown promise in alleviating the condition of the workers. Encouraged by this, a similar approach is being attempted to evaluate vaccine therapy in lung disorders in cotton textile, jute and coir workers.

India ranks third in the world in the production of manganese ore. Around one hundred thousand workers are employed in manganese processing and its use in alloy steel plants, ceramics and dry battery manufacture. Exposure to manganese causes in many workers a kind of nervous disorder resulting in behavioural disturbances.

Studies in experimental animals in which manganism was induced have shown that deposition of manganese occurs in brain subcellular organelles. Early detection of toxicity is possible by the use of two diagnostic tests developed at the Centre. These tests relate to the assay of adenosine deaminase activity in serum and cerebrospinal fluid and the estimation of calcium to phosphorous ratio in serum. These tests have been applied in a few cases of manganism among mine workers in central India as well as welders in a Bombay dockyard The behavioural changes noticed in manganism appear to be related to disturbances in the metabolism of catecholamines and the significance of this in therapy is being explored Iron deficiency in experimental animals makes them more susceptible to the toxic action of manganese than control healthy animals This observation assumes significance in view of the generalised anaemia reported among our industrial workers.

The efficacy of a number of metal complexing agents was investigated in removing manganese from the tissues of animals in which manganese poisoning was experimentally induced. Besides EDTA and its derivatives, the combination of Paminosalicylic acid and isonicotinic acid hydrazide – a commonly used anti-tubercular drug is very effective in mobilizing manganese from tissues and helping in their rapid elimination from the body Efforts are being made to test the utility of this finding in clinical cases of manganese poisoning.

Pesticides

In order to increase the output of food resources commensurate with our growing population, the increasing use of insecticides, pesticides, weedicides and agro-chemicals has become unavoidable. The assessment of the long-term effect of such widespread use of agrochemicals on the farm workers and his ecological partners has assumed added significance. In view of the known toxicity of these agents and the relatively low level of lite-

---

Dr Krishna Murti is Deputy Director, Industrial Toxicology Research Centre, Lucknow.

racy among the rural population, there have been a few tragic instances of deaths due to contamination of grains with pesticides.

The research programme in this area has concerned itself with mapping the neurotoxic effect of pesticides, particularly on behaviour as revealed by pharmacological and metabolic studies Test systems have been evolved to monitor such ill-effects on brain and other tissues as well as eventual mutagenic effects by following observations in bone marrow chromosomes and malformations in the embryo. Attention has also been paid to find out appropriate remedies to counteract both the acute effects as well as side neurotoxic effects of pesticides. Currently, interest is focussed on studying more extensively the effect of chronic exposure to pesticides such as endosulfan, malathion, quinalphosph etc which are likely to be used in our country for the coming few decades and for the manufacture of which indigeneous know-how is being developed in our sister national laboratories

Plastics and Petroleum Products

The use of plastics and synthetic polymers in our daily lives as containers for storage of water and food articles has become widespread. The Centre has an ongoing programme to explore the health hazards caused by the additives, plasticizers and other chemicals used in the manufacture of the containers. Preliminary results indicate disturbances in the functioning of vital body tissues by administration of the plasticizers The plasticizers also seem to affect the normal capacity of the liver to deal with foreign chemicals.

The toxicity associated with aromatic compounds such as benzene in petroleum products is well known. Inhalation of petrol vapours by workers handling gasoline causes discomfort and illness apparently due to the excessive intake of aromatics. A simple tablet test has been developed for detection of phenol, the excessive excretion of which in urine is a good diagnostic test for the toxic symptoms caused by benzene. Experimental studies in animals have revealed alterations in the enzyme profile and lipid peroxidation pattern of liver and kidney. Since kerosene is used extensively as a domestic fuel all over the country attention is being paid currently to the design of experiments to study the toxic symptoms induced by exposure to kerosene.

Synthetic Dyes

Workers in dye industry manufacturing benzanthrone suffer from skin allergy and other ill-effects due to chronic exposure to the dye. Based on experimental work done in rabbits, a simple schedule of treatment with ascorbic acid and niacin has been tried in the sensitized workers. Currently investigations are in progress on the mechanism of the sensitization reaction in order to devise desensitization procedures.

Work on synthetic dyes has led to interest in the toxic effect of a commonly used food colour, matanil yellow, which has been shown in high doses to cause damage to the male reproductive organs. Surveys have been conducted on adulteration of common foodstuffs by such dyes and other harmful agents

The health survey of workers in an ordnance factory at Kanpur has led to the development of a vaccine therapy to alleviate the suffering of the afflicted Limited surveys have also been conducted among petrol pump workers, tannery workers, paint shop workers, welders, etc In collaboration with the Department of Medicine, K G Medical College, Lucknow, an epidemiological survey of a few villages of Unnao District, U P was conducted to find out the nature of the epidemic of paralysis that broke out in 1975-76. Besides the consumption of Kesari Dal, a well known lathyrogenic agent, many of the afflicted families were found to depend upon water supplies which had a very high content of manganese. An interim report containing recommendations has been submitted to the Governor of Uttar Pradesh

Registry of Toxicology

A Registry of Toxicology has been established at the Centre which strives to act as a clearing house of information on industrial health hazards. The Registry subscribes to most of the important journals dealing with toxicology and environmental pollution. The Registry has been recognised as a Regional partner, in the Central network responsible for the compilation of international register of potentially toxic chemicals set up by the United Nations Environment Programme at Nairobi.

The Centre has been selected as a reference laboratory by WHO for problems connected with the health hazards of pesticides. The Centre has analysed, with the sophisticated facilities made available by a WHO grant, a number of blood samples from South America and Gujarat as a follow-up study of pesticide residues in DDT spraymen. Under a project sponsored by WHO, a number of scientists of this Centre have received advanced training in toxicology research in Western Europe and the U.S.A.

Perspectives

In view of the increasing rate at which many health problems are being noticed in industries, it is proposed to expand the activities of the epidemiology wing on the highest priority Besides building expertise in monitoring health hazards due to noise, air and water pollution, the wing has to develop capabilities to introduce the concept of systems analysis to set up models from which threshold limits of environmental pollutants can be computed Public sector undertakings such as the Indian Telephone Industries, the Fertilizer Corporation of India and the Indian Petroleum Corporation have shown interest in conducting health hazard surveys in the factories under their control The details of such joint studies are being finalised so that work could start in 1978. The Small scale Industries Corporations set up in many states have been approached for a survey of occupational health hazards among millions of workers engaged in small industries and in the rural sector

Chemicals

As an extension of the activities of the Centre, the CSIR has approved a proposal for the creation of a Centre for Safety Evaluation of Pesticides. The objectives of the Centre are to take up on a sponsored basis the safety evaluation of pesticides for purposes of their registration under the Insecticide Act, evolve techniques for monitoring the harmful effects of pesticide residues in our foodgrains and develop remedial measures

By carefully planned animal experiments, studies with lower organisms etc and by observations on workers exposed to them over a long period, it would be possible to predict safety limits of such pesticides. This would help in framing appropriate legislation to prevent environmental pollution by these toxic agents. □

Plant Life

B. R. JUNEJA

FROM A SMALL plot, in the erstwhile Government Horticultural Garden, Lucknow, placed at the disposal of the Botany Department of the Lucknow University in 1932, for the cultivation of medicinal plants, to the present 62-acre National Botanic Gardens, makes a fascinating story of the origin and development of the NBG, Lucknow, set off against a colourful historical background. Now a premier botanical institute in the country, NBG carries on research work in botany, horticulture and plant chemistry, besides maintaining and developing a full-fledged botanical garden.

The garden part of the NBG encompasses within its limits the ancient Sikander Bagh which was laid out around 1800 A.D as a royal garden by Nawab Saadat Ali Khan of Lucknow and later improved upon by Nawab Wajid Ali Shah the last king of Avadh, during the first half of the 19th century. Nawab Wajid Ali Shah also named the garden after his favourite queen, Sikander Mahal Begum. Sikander Bagh was also the scene of a fierce battle during the uprising of 1857, when about 2,000 patriotic Indian soldiers, who had barricaded themselves in the garden, were killed in a British attack Articles like cannon balls, broken swords and shields, muskets and rifles, etc , dug out of the garden over the years, still remind one of that historic event.

After the establishment of the British rule, land around Sikander Bagh was also attached to it, and the garden was renamed as the Government Horticultural Garden Several well known British horticulturists, namely, Dr. J. Cameron, Dr. E. Bonavia who wrote one of the early authoritative monographs on *Citrus*, Mr. M. Ridley and Capt. G L Hollings, were successively the Superintendents of this Garden which became a centre of horticultural activities, holding of flower shows, supply and exchange of plants setting up of flower nurseries, etc , in the Northern India. Several fruit orchards, a flower nursery, and lawns were added to the Garden which was also maintained as a public park

The Beginning

In 1932, Prof. Birbal Sahni and Dr. S.K. Mukherji of the Department of Botany, Lucknow University, acquired a small plot of land in the garden for the cultivation and study of medicinal plants. This also led to the realisation of the potentialities of the garden for its development into a botanical garden. Consequently, a proposal was made to the Government of U P. in 1946, for the reorganisation of this garden into a botanical garden to serve as a centre for botanical and horticultural research The proposal was accepted in 1948 and some funds and a small staff were sanctioned for the reorganisation The garden was rechristened as the National Botanic Gardens and Prof K N. Kaul, then Professor of Botany, Government Agricultural College, Kanpur, was appointed Honorary Director. Five Years later, impressed with its aims and objects and promise of becoming a leading centre of research in botany, the Council of Scientific and Industrial Research took over the Gardens on April 13, 1953. Since then, the NBG has been working and developing as one of the 34 national laboratories under the CSIR

The NBG now comprises a well laid out garden, a rich herbarium, a vluminous library, excellently equipped research laboratories, a modern auditorium and a 300 acre field research station at Banthra, a village near Lucknow. The 27-hectare garden has an arboretum, a rosarium, a conservatory, a cactus house, a palm house and a fern house, besides a huge collection of wilk and cultivated plants, indigenous as well as exotic, all totalling up to about 1500 taxa. A special mention may be made of varietal collections of certain ornamentals like Bougainvillaea, Canna, Chrysanthemum, Hibiscus, Ixora, lotus, *Nymphaea* and bulbous plants. The herbarium contains about 90,000 plant specimens, properly identified, classified and incorporated. The library has around 26,000 volumes on its shelves, and subscribes to 400 research periodicals and journals and houses a Patent Inspection Centre. The 300-acre Banthra Research Station serves as an extension-cum-experimental station where different types of economic plants, able to grow on saline-alkali soils, are cultivated, with a view to utilisation of *usar* soils.

The R & D effort of the National Botanic Gardens is geared to introduction, conservation, propagation, protection, genetic upgrading and utilisation of native and exotic plant wealth of India, with particular reference to non-agricultural plants of economic importance and ornamentals.

Aims and Objectives

The main aims and objectives of the NBG are:

1. Building-up of a National Germ Plasm Bank of the aforementioned plants and maintenance of special collections;
2. Botanical, horticultural and chemical researches aimed at utilisation of plants and plant products and development of production technologies for new plant sources of commercial importance;
3. Serving as a national centre for creating a consortium of Indian Botanic gardens for the development of Plant Genetic Resource Centres in different agro-climates of the country;
4. Providing necessary expertise and assistance for identification, supply and exchange of plants and propagules, garden layout and landscaping, and organisation of flower shows, exhibitions and training courses in garden technology and systematic botany, particularly, of cultivated plants;
5. Dissemination of information on the R and D activities of the institute through publication of scientific and popular literature for scientists and amateur and professional gardeners and planters.

Some of the notable R & D activities of the NBG are described below.

That floriculture is a multi-million dollar trade abroad is well known, but, what is not equally well known is the fact that it is so in our own

Shri Juneja is Head, Information, Publications & Liaison, National Botanic Gardens, Lucknow.

country as well. According to an ICAR survey, flowers worth Rs. 9.26 crores were sold in 1962 in the five metropolitan towns – Delhi, Bombay, Bangalore, Calcutta and Madras – alone and on that basis, the floral trade at current price level may safely be estimated to run into about Rs. 30 crores per annum. Taking the country as a whole, this figure will be manifold. But, still more surprising is the fact that this large trade in flowers has no scientific base worth the name. In view therefore, of the ever increasing trade in flowers and also house plants in the country, of the lack of a proper scientific base for it and of its export potential, the NBG intensified its R & D effort in the field of floriculture a few years ago and initiated a multi-disciplinary programme of work, which includes develoment of (a) fifty New Cultivars of 11 wellknown ornamental plants, (b) F_1 Hybrid Marigolds, (c) Programmed or Precision Blooming of Chrysanthemum, (d), Sept.-Oct. Blooming Cultivars, (e) Introduction and Domestication of Wild Plants of Ornamental Value and (f) Dehydration of Fresh Flowers and Foliage.

Medicinal, Aromatic and Essential Oil Plants

Even though modern medicine is widespread in India, majority of the country's population still depends on crude drugs for the alleviation of their sufferings. India is probably the only country in the world where the two ancient Ayurvedic and Unani systems of medicine still survive and flourish, side by side with the allopathic and homoeopathic systems

Although many drugs of the indigenous systems of medicine enjoy a high repute, few of them are scientifically standardised. Correct botanical identification and standardisation of these drugs is, therefore, of great importance. Equally important is the standardisation of agro-techniques for commercial cultivation of these drug plants, most of which are collected wild or imported.

The NBG has been making pharmacognostic studies on indigenous drug plants for some years during which about 300 plants have been analysed for their alkaloids, flavonoids and steroidal sapogenin contents. Recognising the expertise available in this field at NBG, the Central Council for Research in Indian Medicine and Homoeopathy has been running for some years a Composite Drug Research Scheme at NBG.

Alongside, investigations have also been continuing on such well-known medicinal plants as *Dioscorea* spp., *Papaver somniferum* (opium poppy), *Solanum* spp., *Trigonella* spp and Atropa *belladonna*, for their genetic improvement and higher yield. Investigations are going on, on the indigenous perfumes and essential oils, such as, those of Jasmines, *Har-Singhar* (*Nyctanthes arbortristis*)

Industrial Seed Resources

The diverse and abundant floral wealth of India includes many species, the seeds of which are rich in gums, mucilages, non-edible oils, starch and proteins, but, have all along been going waste on account of their wild occurrence, lack of arrangements for their bulk collection and inadequate knowledge about their usefulness. The attempt in this area has, therefore, been to bring out new, rich sources of industrial plant materials with particular reference to seed mucilages and gums and protein and lipid rich seeds and to develop knowhow for their industrial utilisation.

The NBG undertook the introduction and acclimatisation of grapes to North India over 15 years ago and its pioneering work in this field has led to some very useful results. Muscat of Hamburg, Perlette and Beauty seedless are some of the varieties of grapes recommended for commercial cultivation in North India. Besides standardising methods for training, pruning and fertilisation of the vines, the NBG has been carrying on investigations on other agronomic and horticultural aspects of grape cultivation, such as, foliar nutrition, fruit bud differentiation, mineral deficiency,.

A method has been perfected for the large-scale clonal propagation of virus-free *Chrysanthemum* and *Citrus* spp with the help of tissue culture technique Basal ends of small shoot spices of chrysanthemum, cultured aseptically in a certain nutrient medium, give rise to numerous shoots each of which can be rooted and developed into a new plant Thus, thousands of true-to-type and virus-free chrysanthemum plants can be obtained from a few shoot apices within a period of 6 months. Likewise, proliferating vegetative callus tissues of *Citrus grandis* (shaddock), *C. sinensis* (sweet orange) and *C. aurantifolia* (lime) can be made to give successive crops of shoots which can b rooted and developed into thousan of virus-free and true-to-type in dividual plants, fit for transferren to soil.

Taxonomic and Morphological Studi

Side by side with the NBG's prog ramme of introduction, conserva tion and documentation of germ plasm, taxonomic and morphologi cal studies are also pursued activel on different groups of plants, wil as well as cultivated. Extensive stu dies have been made or algae, fungi lichens, ferns and certain orna mental taxa, resulting in the sett ing up and discovery of a numbe of new species. Palynological studie have been made on cultivated, hone and allergenic plants.

Three-Way Public Interaction

The National Botanic Gardens interacts with the outside world on three fronts : (i) teaching and R&D institution, (ii) plant industry, and (iii) public

(i) *Teaching and R & D Institution* The NBG supplies teaching and research materials to the educational institutions for botanical studies and exchanges plant material and information. It also conducts joint research programmes with universities and colleges and organises special lectures, demonstrations and exhibitions for the students Identification of plants and provision of information on their occurrence, distribution, economic utility, etc., are provided at request

The NBG is recognised by a large number of Indian universities as a centre of post-graduate research and advance studies, leading to the award of Ph.D degree, in various branches of Botany, Agriculture, Horticulture and Plant Chemistry

Sixtyone members of the scientific staff and research fellows have so far obtained their Ph D. degrees for research work done at NBG in various subjects.

(ii) *Plant Industry* : The NBG supplies nursery stock and planting material of non-agricultural economic plants to nurserymen and others at nominal price; dehydrated flowers and foliage are also provided Identification of indigenous drug plants and standardisation of the agricultural practices and pharmacognosy of indigenous drugs, extraction of essential oils and perfumes, economic utilisation of non-edible oils and fats, cultivation and utilisation of subsidiary foods and fruits, etc., are some other fields in

which the NBG interacts with the plant industry. Analysis and extraction of essential oil is also undertaken at request. The NBG also trains industrialists in the extraction of essential oils from aromatic and essential oil plants.

(iii) *Public* : In order to create and develop bioaesthetic sense and love for flowers among the public, to provide them with basic and minimum knowledge for growing flowers in their houses, to afford opportunity to the garden enthusiasts, nursery men and other garden lovers to exhibit their floral collections and to bring to the notice of all concerned the latest varieties of flowers of different types, the NBG organises every year 4 Flower Shows and conducts a few training courses in the art and science of cultivation of flowers and gardening.

The NBG also sells authentic and new nursery stock and flower seeds/seedlings to the public, throughout the year from its Sales Section. There are number of picnic spots in the garden which are open to public, free of charge. Scientific and technical advice on gardening and economic plants and technical assistance and guidance to horticultural societies and clubs are offered from all quarters for the mere asking.

Future Plans

As there is hardly any single agency in the country which caters to the needs of the scientist, the planner and the industrialist, the NBG will shortly set up an 'Information Centre For Tropical Economic Botany', which would provide scientific and technical information in the fields of documentation of germplasm, non-agricultural industrial seed resources of gums, proteins and lipids, indigenous herbal drugs, certain subsidiary foods and fruits, condiments and spices, floriculture and utilisation of saline-alkaline soils, with special reference to the tropical areas of the world.

To give fillip to its projects on Palynology, Industrial Seed Resources and Propagation of Medicinal and Ornamental Plants by tissue culture, the NBG has plans to organise Seed, Pollen and Tissue Bank, wherein seeds and pollen grains and tissues of plants of interests will be collected and preserved for use as and when required.

Like the Information Centre, the Seed, Pollen and Tissue Bank will be a national facility, at service of the scientific community at large.

At the instance of the National

'Birbal Sahani', a new snow-white variety of Chrysanthemum, developed by NBG fron Japanese variety.

Commission on Agriculture, the NBG has also taken up the assignment of preparing an "Atlas of Medicinal Plants" which will find extensive use in the indigenous systems of medicine, such as Ayurveda, Unani and Siddha The NBG will also help in setting up Herbal Gardens in the villages in which village schools and other rural institutions will also be involved

A project of great national importance and of special relevance to the rural and tribal development is that of Ethnobotany which the NBG has recently taken up. It ai at making a survey of all those w and cultivated plants which fi some use in the life of the tril people and other rural communiti in their medicine, food, social a religious customs and rites, housi and clothing, fibre, etc The proj will not only result in the collecti of valuable information on the t ditional uses of plants by the tri people, but also benefit the nat at large by bringing to light m new plants of potential economic or new uses of some known plants

Study of the Oceans

S. Z. QASIM

THE NATIONAL Institute of Oceanography, Goa, is the only laboratory in the country to carry out oceanographic researches in the high seas. With the declaration of 200 nautical miles by India as her economic zone, the responsibilities of the Institute have increased considerably. Economic zone in the sea would mean a zone over which we have full technological control. Our country will soon have full competence to explore and exploit all types of resources from the economic zone

The National Institute of Oceanography (NIO) came into being in 1966 The campus of the Institute is located in Dona Paula, about seven km away from Panaji. The Institute has three regional centres at Bombay, Cochin and Waltair. The main objectives of NIO are to develop adequate knowledge related to physical, chemical, biological, geological, geophysical and engineering aspects of the seas around India and to build up competence in using the sea for the benefit of our people These benefits are connected with the exploration and exploitation of living and non-living resources of the sea, coastal development, offshore engineering works and pollution control. NIO is also aiming at developing indigenous technology for the exploration and exploitation of marine resources and being the focal point of oceanographic data and information services pertaining to the Indian ocean region.

NIO has seven divisions, namely, physical oceanography; chemical oceanography; geological and geophysical oceanography, biological oceanography,; instrumentation; planning and data and ocean engineering. The institute has identified seven priority areas for R & D These are: food from the sea; minerals from the sea; energy from the sea; progressive development of indigenous technology; coastal zone management; protection of the marine environment and technology utilisation. It is also engaged in several international projects of a cooperative nature.

Building-up Expertise

Oceanography, encompassing a multi-disciplinary approach to the study of the ocean, is a comparatively new science for India. Our involvement and participation in several expeditions and cruises in the Indian Ocean have helped in building up expertise and in the collection of a large volume of data from the Indian Ocean. The Institute has published more than 700 research papers on the seas around India.

NIO has been able to plan, build, equip and run successfully since February 1976 RV GAVESHANI—the first oceanographic research vessel of India Redesigned and built out of a hopper barge at the Garden Reach Workshops Ltd., Calcutta, RV GAVESHANI has been equipped for carrying out multi-disciplinary oceanographic research work practically throughout the year The endurance of the ship is 25 days The ship is equipped with modern oceanographic and navigational equipment

Seafood Resources

Earlier surveys of fish resources in the sea conducted by the institute have brought to light some rich grounds off Gujarat and Konkan coasts which are now being exploited. Recent surveys made on board RV GAVESHANI have revealed the existence of very rich fishing grounds in deeper areas of the Bay of Bengal and the Lakshadweep Sea

The institute has developed several technquies of aquaculture from floating rafts and in brackish water swamps and estuaries with a view to generating extra seafood resources from hitherto utilised areas. Certain varieties of mussles and oysters cultured in our coastal waters have given a very high yield. It is now proposed to develop the technology of aquaculture using treated domestic sewage.

Surveys conducted by the institute have shown that the coastal waters off Ratnagiri have appreciable qualities of ilmenite. At present efforts are under way to make a quantitative assessment of the ilmenite deposits.

The institute has completed a detailed survey of the 160 km oil pipeline route from Bombay High to Bombay for the ONGC using RV GAVESHANI. This survey has contributed greatly in breaking the monopoly of foreign companies which were carrying out such surveys at a formidable cost earlier. This survey has saved a very sizeable amount of foreign exchange. It has also given a new orientation to the utilisation of indigenous marine technology available within the country. The long term benefits of this work to the country are considerable as the crude from Bombay High will continuously be made available through the submarine pipeline to the shore refineries

The institute has also located a new site for jacking up the drilling vessel SAGAR SAMRAT for test drilling on the Angria Bank off Ratnagiri.

Pollution Control

The institute has completed many projects sponsored by the industries and public sector undertaking to control pollution caused by the indiscriminate discharge of waste into the sea The beneficiaries of these projects are the coastal areas of Gujarat, Maharashtra, Goa, Karnataka and Kerala A sizeable project to control the pollution off Bombay, sponsored by the Bombay Municipal Corporation, is nearing completion. The marine surveys carried out so far by the institute on the control of pollution have helped several industries to save valuable foreign exchange because such surveys were being carried out earlier by foreign companies only Apart from the sponsored projects, surveys of different marine pollutants, for example, petroleum hydrocarbons, chlorinated pesticides and heavy metals are being regularly carried out using RV GAVESHANI as a regular watch of the "health of our seas".

Coastal Development

The institute has completed nearly two dozen projects which have contributed a great deal to the coastal development programme. The beneficiaries of these projects are the Government of Goa, Daman & Diu,

Dr. Qasim is Director, National Institute of Oceanography Dona Paula. Goa.

the Government of India, Mormugao Port Trust, Cochin Port Trust, the Government of Kerala, the Indian Navy, the Indian Resort Hotels Ltd., Bombay, etc. Our findings have helped in the expansion of the Cannanore fishing harbour, the Cochin and Mormugao harbour, in assessing the feasibility of an atomic power plant at Loliem (Goa), off shore oil terminals off Narara Bet (Kutch) and of Cochin, in effective navigation in the Mandovi and Zuari estuaries, in development of a 5 star hotel (Fort Aguada Beach Resort of the Taj Group of Hotels) at Singuerim (Goa), in demarcating dangerous zones along the beaches for swimming and in the construction of boat pens and jetties. These examples indicate the range of expertise and the technical knowhow available at the institute. The revenue earned by the institute from all these activities during 1976 was about Rs. 35 lakh. It has already crossed Rs. 36 lakh during the first five months of 1977.

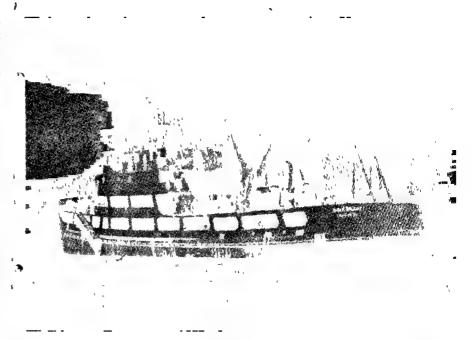
Erosion problems of several coastal areas of Kerala, particularly near the Thumba rocket launching base and at Goa have been studied fairly intensively by the institute and some remedial measures have been suggested

Marine Instrumentation

At present most of the instruments used in oceanographic research are imported Efforts are being made to develop self-sufficiency in this field as early as possible The institute has already developed several electronic instruments These are. tide and wave recorder and counter depth recorder, electronic sedimentation balance, inductive salinometer, electromagnetic current meter, electronic bathythermograph and telemetring system for oceanographic data acquisition.

The institute has developed the Indian National Oceanographic Data and Information Centre which is functioning as a national facility for the acquisition, storage and dissemination of oceanographic data pertaining to the Indian Ocean region

NIO has been selected by the United Nations Environment Programme (UNEP) as a regional centre for the project "Marine Environmental Monitoring and Marine Living Resources Assessment for the Indian Ocean Region". The first phase of the project has been completed.

NIO is also implementing the Indian national programme for marine pollution (petroleum) monitoring pilot project (MNP-MOPP) under the framework of the Integrated Global Ocean Station System (IGOSS) of Intergovernmental Oceanographic Commission (CIOC/UNESCO)


Under these two projects, several scientists have been trained abroad on the use of advanced techniques

Looking Ahead

Detailed surveys will be conducted to have a better knowledge and understanding of the food resource in the seas around India (upto 370 km) Efforts will be made to link up the results with the programmes of other national agencies Experimental work on mariculture and sea farming will be expanded with a view to developing cheaper technology for successful sea farming including the use of treated m domestic sewage for aquaculture This technology will be transferred to the actual users

Detailed surveys will be conducted in promising areas to quantify the mineral resources of the continental shelf

Intensive efforts will be made to develop plans for harnessing tidal and wave energy

The institute will make specia[l] efforts to build competence for hand[l]ing the various types of marin[e] surveys in accordance with the need[s] of the country Special emphasi[s] will be given to off shore structures ocean engineering and pollution control so that the indigenous tech[n]ology already available can b[e] utilised to the maximum.

It would be necessary to have [a] second research vessel A strong work[]shop and a large service group wit[h] all possible shore facilities will hav[e] to be developed to cater to the need[s] of the ship-board equipment. Th[e] regional centres will have to b[e] sufficiently equipped and strengthen[]ed to undertake problems of regio[]nal interests

Programmes will be developed t[o] explore and exploit large quantitie[s] of polymetallic nodules found o[n] the floor of the Indian Ocean.

By 1982 it would be possibl[e] with the second research vessel, fo[r] our scientists, to sail as far south a[s] the Antarctic Ocean and to conduc[t] successful scientific expedition[s] The southern extremity of the India[n] Ocean merges with the Antarcti[c] Ocean □

The research vessel, GAVESHANI built at the Garden Reach Workshops, Calcutta is the first of its kind equipped to carry out multi-disciplinary oceanographic research.

THE ENVIRONMENT—5

Recovering Hidden Sea Treasures

D. J. MEHTA

THE CENTRAL Salt and Marine Chemicals Research Institute, Bhavnagar which has just completed its 23rd Anniversary has, for the past few years, devoted itself not only to the pursuit of industrial research in the field of marine chemistry and other technologies relevant to the charter of the Institute, but a significant reorientation has been given in the selection and implementation of R & D problems of national importance with a view to creating self-reliance in technologies so vitally required for achieving the socio-economic objectives envisaged in the various national development plans.

The research programme of this Institute generally revolves round the sea – a storehouse of chemicals which has fascinated man since ages. In order to unearth and harness these hidden treasures, the Institute has carried out relentlessly investigations for developing various processes for the economic recovery of marine chemicals of industrial importance namely, magnesium compounds, potassium fertilisers, bromine, as import substitution products, in order to minimise the country's already heavy import bill. The contribution made by this laboratory has been of direct relevance to industrial development of the country particularly in (i) developing know how for processes or products, (ii) creating scientific base for new industries by providing with feasibility studies and (iii) providing design engineering and consultation services. The Institute also provides facilities for training of technical personnel to assist in the planning and execution of industrial projects of relevance to the Institute. As regards the capabilities of the Institute, it commands expertise in the field of phase equilibria of salt solutions, flotation, ion-exchange and desalination techniques. Recently work on the utilisation of solar energy for developing various useful devices has also been undertaken

---

Shri Mehta is Director, Central Salt & Marine Chemicals Research Institute, Bhavnagar.

Objectives of the Institute

1. Research and development work on salt marine chemicals and inorganic chemicals channelised specially towards improvement in quality of salt for industrial use and for export, preparation of different varieties of salt, mechanisation of operations in salt works, to offer consultancy work for establishment of new salt works, recovery of potassium fertilisers, manufacture of refractory grade magnesia and important magnesium compounds, extraction of bromine from sea water and bittern, preparation of inorganic silicates of importance, studies on corrosion etc
2. Research & development work on desalination techniques (solar, flash and vapour compression distillations), reverse osmosis process using different types of osmotic membranes, electrodialysis technique using ion-exchange membranes, correlation studies on performance of membranes with physico-chemical and transport parameters, applications of membrane processes to other industrial uses
3. Research and development on synthesis of various types of organic and inorganic ion-exchange resins and materials for general and specific requirements, studies on continuous counter current ion-exchange operation for water treatment and pollution control, applications of ion-exchange resins for recovery of chemicals from waste or for preparation of new chemicals.
4. Research and development work on evaluation of sea water tolerance of plants and crops of agro-industrial value, to develop system of "Saline hyddoponics" on coastal sanc belts.
5. R & D work on culture ar propagation of economic s weeds, utilisation of seawee as food, feed and manur extraction of seaweed chem cals such as agar agar, sodiu alginate and protein and oth valuable chemicals, utilis tion of seaweed for growi industrial micro-organisms ar for preparation of bio-medic substances, seaweed surv of coastal regions.
6. R. & D. work on solar devic like solar cells, solar stil solar water heaters, solar pum solar ice machine, driers etc

Extensive Research

Common salt is manufactured India exclusively, by solar evapor tion of sea-water, sub-soil and la brines. Last few years of extensi research has resulted in phenomer growth of salt industry with con derable improvement in quali and yield of salt. CSMCRI h a share in this achievement. Althou the country is fully self-sufficie with regard to its requirement salt, the production being 6 million tonnes, the quality of sa for industries and export nee further improvement. The Institu has successfully demonstrated i scientific competence in the instal tion of solar salt works which giv better quality and yield of salt has introduced new ideas on pi crystalliser and series feeding syste to produce better quality salt i quired by the industries, and fo increasing the yield of salt witho much alteration in the layout

The Institute has organised annu training courses specially for tl technical personnel employed salt industry. About 150 techn cians representing different sa works from all over India have bee benefited by the training. Based c scientific concepts the Institute h prepared complete layout and desig of six modern solar salt works, an provided technical assistance to tw firms one each in West Africa an Saudi Arabia.

On the socio-economic aspec the investigations made by the In titute in the field of nutrition deser special mention. The nutrition e perts noticed that the majority population in rural area suffere from deficiency in essential nutrie elements such as calcium, iron an proteins. Endemic goitre is prev lent very largely in certain nort

eastern parts of our country due to deficiency of iodine. The salt which is used in daily diet could be a convenient and useful vehicle for supplying these essential minerals and nutrients to human beings and animals. The Institute has developed techniques to fortify common salt with these minerals. Conventionally iodised salt is manufactured by dry or wet mixing of potassium iodate with salt. Institute has developed a simple process to iodise salt by submersion in brine containing calcium iodate, which gives a uniform distribution and greater stability.

Marine Chemicals

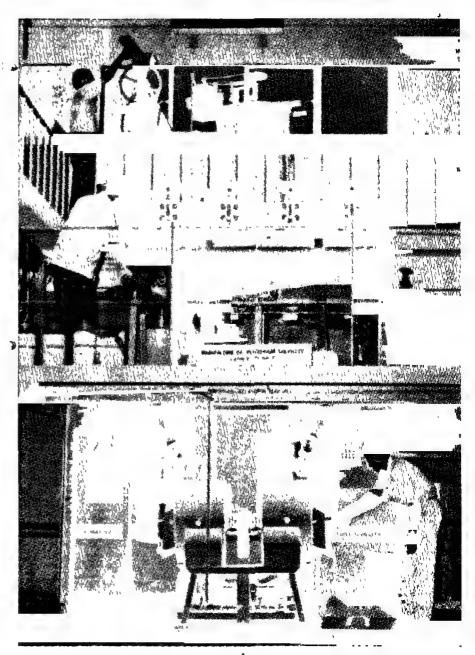
In the field of marine chemicals, a significant achievement is the development of import substitution products utilising the end liquor known as bittern, let over after recovery of salt It cantains valuable chemicals such as salts of potassium, magnesium, bromine, some of them being imported even at present In India the only source of potassium fertilisers and potassium chemicals at present is sea and inland bitterns. The potential capacity for production of potassium fertilisers from the entire sea and inland bitterns available from the major salt works is about 25,000 tonnes of K_2O against the present requirements of 6 5 lakh tonnes. The Institute has successfully developed indigenous technology for the recovery of potassium chloride and potassium schoenite as fertilisers, potassium schoenite has been introduced for the first time in India. It has been acceptable as a good substitute for imported potassium sulphate required for certain crops and fruit trees It is now included in Government of India's Fertiliser Control Order. Commercial production of potassium schoenite has already been started. Negotiations are under way for setting up more such plants in the country.

For the manufacture of kraft paper, glass and detergents, some 2,00,000 tonnes of sodium sulphate is required. The Institute has worked out a process for the economic recovery of sodium sulphate from sel's mixts, a byproduct of salt manufacture.

Another industrially important chemical, bromine is imported. Tata Chemicals are still the exclusive manufacturer of bromine. With the growth of bromine consuming industries namely, dye and intermediates, photography, fumigants, perfumery and textile, the demand has substantially increased. The present demand is 750 tonnes per annum while by 1985 it will be 1000 tonnes. By setting up a pilot plant of bromine, the Institute has acquired sufficient expertise to set up higher capacity plants even on turn-key basis. The knowhow has been successfully commercialised, and the country is likely to save considerable foreign exchange when full production starts.

One of the very recent achievements of the Institute is the long sought after for steel industry. Refractory magnesia, largely required for lining of the steel producing furnaces and equipments, is at present being manufactured from mineral magnesite. However, the demand for this material is very large and about Rs. 10 million have to be spent to import the basic refractories for steel manufacture every year. The Institute has successfully prepared refractory grade magnesia directly from sea-water and upgraded lime. Pilot plant studies have indicated that it is possible to produce magnesia containing 2 to 2.5% CaO which is useful for steel furnace lining. It is evident, the commercialisation of the process will help the country towards having considerable foreign exchange.

Other important work in the chemical field carried out by the Institute may be mentioned the development

The Potassium Schoenite Plant of the Institute has started commercial production of potassium schoenite which is a good substitute for imported potassium sulphate.


of knowhow for the preparation of various silicates. These have wide industrial applications in rubber, paper and plastic manufacture, namely synthetic calcium silicate and its insulation blocks, precipitated variety of silica, pharmaceutical grade magnesium trisilicate, 4A type Molecular Sieve, useful variety of industrial applications.

Crude borax from Pugga Valley contains rubidium and cesium The recovery of these rare alkali metals is carried out through alum process. Similarly, the recovery of lithium from crude borax and Indian Lepidolite is worked out. Lithium salts are very useful for imparting glaze and gloss to-costly ceramic materials and sanitary wares The country imports about 400 tonnes of lithium sales.

Seaweed Research

The Institute has made out systematic studies on a variety of seaweeds, extensively growing on the Indian coastline Until recently there was hardly any awareness of the economic importance of seaweed resources. Systematic researches on seaweed utilisation were undertaken and processes developed for the manufacture of seaweed products namely, agar and alginates, and biological and chemical studies on seaweed were also carried out. Various seaweed chemicals such as agar agar, agarose and alginates find increasing use in bacteriology, various food preparations and many industrial applications. The Institute has helped to set up a number of seaweed chemical industries to make the country self-reliant and simultaneously save precious foreign exchange.

Another important contribution made in this field is the starting of a scheme for the artificial cultivation of economic seaweeds like Gracilaria and Gelidiella since the existing seaweed resources are found to be inadequate In order to support many of the new industries on agar, alternatives had to be found for supplementing the seaweed resources. Industries have also joined with the Institute in this collaborative work on cultivation of seaweeds.

Potable water is our basic and indispensable need. Its quality and supply in adequate quantity has taxed the ingenuity of every generation. With the advent of rapid industrialisation and growing population the demand for water of municipal, industrial and agricultural purpose is ever increasing. Further, the droughts frequently recur especially in Saurashtra, Kutch, North Gujarat, Rajasthan and some areas of South India. In an effort to ease the problem of water, both for domestic and industrial use, the Institute has developed indigeneous technology for desalination of brackish and saline water resources, such as the membrane and distillation techniques

(i) *Solar Distillation* : Extensive data have been collected on solar distillation of sea-water on a pilot plant of 1000 litres of fresh water per day capacity Based on this data, designs for solar stills of various capacities have been supplied to numerous organisations namely. educational institutions, research laboratories, petrol pumps, lighthouses etc, for producing distilled water. Collection of engineering data on three stage flash-distillation unit has been completed. A design for 30 tonnes per day single stage vacuum distillation unit has been supplied to a Naval Dockyard for seagoing vessel

(ii) *Reverse Osmosis* . The institute has succeeded in the preparation of flat and tubular semi permeable membranes and for fabrication of tubular and spiral reverse osmosis plants The success of reverse osmosis desalination units have already been demonstrated by establishing and operating such units to the Border Security Force in Kutch, and drought affected village Rajasthali in Saurashtra for treating highly saline brackish water to obtain potable water, to the entire satisfaction of the people of that area The knowhow has been released to six well-known engineering firms

The achievement for the development of indigenous know how for reverse osmosis does not end with desalination of water only The reverse osmosis technique has potential uses in the various fields such as recovery of costly chemicals from industrial effluents, concentration of fruit juice, separation of chemicals etc.

(iii) *Electrodialysis* : Another membrane technique of desalination is the electrodialysis, involving the use of ion-exchange membranes Few years of continuous efforts at the Institute for developing an indigenous technology for preparation of membranes with entirely indigenous raw materials has born fruits. Many improvements in them embranes have been made now and conditions for synthesizing the interploymer membranes have been optimised.. Like the reverse osmosis technique, th method has also proved to be a economical success, the plants hav ing been perated at various plac The knowhow has been commer cialised.

The developing desalination tech nologies entirely indigenous f obtaining potable water, is a majo breakthrough which has grea socio-economic significance in con text of continued drought and wat scarcity problems of the country

Ion Exchange

Technology for softening the har water containing about 3000 ppm TDS using continuous counter cu rent ion-exchange technique ha been developed and knowhow released to three parties who hav already commissioned the plant Efforts are in progress to deminera lise the brackish waters using simila technique.

Ion-exchange as a means of solvin many chemical problems has caugh the attention of scientists in recen years. The Institute has acquired good deal of expertise in utilisin the ion-exchange technique in variou fields other than water softening specially in the recovery of chemi cals The technique has been success fully applied for the preparation o alkalimetal bromides, potassium silicate, potassium nitrate, I L grade boric acid and silica gel a sponsored schemes. Another signi ficant achievement deserving men tion is the development of a proces using ion-exchange technique fo the recovery of potassium chlorid from the spent wash liquor of sugar industry Already a firm in cooperative sector in Maharashtra has decided to commercially exploit the knowhow Looking to the enormous amount of such liquors available from all over India, the technology developed has great significance

Another significant development is the continuous counter current ion-exchange unit for treatment of water This technique has many advantages over the conventional fixed bed deionisation unit, in the sense that, in this process (1) the quantity of resin required is almost one-third, (2) quantity of regenerant is less and idle period of rinsing the resin is completely eliminated and (3) equipment cost is cut down considerably. The technique is very suitable for effluent treatment.

Success has been achieved in developing inorganic ion-exchangers like ammonium phosphomolybdate, ammonium phosphotungstate, poly-

antimonic acid, suitable for isotope separation.

India having a long coastline of 5000 Km and about 8.5 million hectares of coastal sand dunes affords enormous possibilities of harnessing sea-water for irrigation. The laboratory and field experiments carried out in the Institute have shown feasibility of growing highly tolerant varieties of pearl millet (bajra), Sorgham (Jowar), wheat, safflower, cotton sugar-beet, chicory etc. using sea-water along with necessary nutrients.

The experiments have indicated that the gradual acclimatisation is necessary to obtain good results. It has been also observed that quality of grains produced by sea-water is comparable to those produced by fresh water. Many more crop varieties are being tested in this new method of cultivating plants with saline water over sand dunes.

Solar Energy : Utilisation

In the present energy crisis, solar energy, the nature's gift, is bound to play very useful and important role. It is a plentiful and pollution free resource of energy. Although its diffuse nature and availability during day time alone constitute drawbacks it has however its own merits and place in the present energy spectrum.

Research and development is being done on following schemes which are in progress with a view to economic utilisation of solar energy for various uses:

1. Low temperature application e g solar ice machine.
2. Solar hot air engine for pumping the water,
3. Solar cells for rural electrification.
4. Solar driers for drying the moist or wet substances.

The Institute has done extensive work on laboratory, pilot plant and field scale and gained good expertise in designing and construction of solar stills to obtain fresh water from saline water utilising Sun's heat energy. This method has been found techno-economically feasible to provide drinking water to scarcely populated isolated regions where available water source is saline The technique has also been found useful for getting good quality distilled water for laboratories and batteries

The Institute has supplied design drawing to many interested parties all over India to install solar stills. Solar stills have also been established at Navinar Lighthouse for meeting the drinking water requirements of staff. Recently the Institute has been constructing solar still plants at the village Awania in Bhavnagar district and at Narayan Sarovar in Kutch to meet the drinking water needs under the rural upliftment programme.

R & D work is in progress to study the economic utilisation of solar energy to fabricate solar ice machine, solar engine for pumping water, solar cells for rural electrification, solar driers for drying the moist substances and solar oven. □

ENGINEERING IN HARMONY

(Contd from page.........6)

red, atomic absorption spectrophotometer and gas chromatograph, are also available and these facilities are provided to various organisations in the field.

Technology

The know-how on products, processes and equipment is being offered for commercial exploitation through CSIR and NRDC. Training courses are organised to impart knowledge of the latest developments and skills required for efficient performance of personnel in the profession. Extension activities are undertaken where the scienitsts actually move to the area of users to demonstrate utility, viability and advantages of the new techniques. In consultancy services, NEERI associates with the clientele right from the development of knowhow to a stage where the clientele can put it to use independently.

A Long Way to Go

NEERI, by itself, can undertake only typical problems. For resolving several environmental engineering problems as they come up, a still better participation of the beneficiaries in the Institute's R & D programmes is necessary.

As a consequence of the legislation on water pollution, several States have recently set up water pollution control boards like the one at the Centre. The Air Pollution Control Bill is also on the anvil. The day is not far off when an attempt to foul the environment, inadvertently or otherwise, will be punished as an offence. What should be aimed at is the minimal resort to legislation This is possible only with a devout determination on the part of the industries, corporations and such other civic agencies to conceive of environmental pollution control measures at the inception and implement them in right earnest as an integral part of their various schemes. □

BUILDING FOR THE MILLIONS—1

New Dimensions in Plywood

JOSEPH GEORGE

ORGANISED LARGESCALE wood-based industry has been developed in the country only during the last three decades. The second world war gave an impetus to the industry, particularly in the field of plywood. With growth and expansion came the realisation that if the industry is to become self-reliant and is to diversify into more sophisticated and specialised fields and attain international competitiveness for export, active efforts in pure and applied research in the fields of wood science and technology relating to the manufacture of panel products would have to be begun sooner or later.

A timely suggestion came from the Indian Tariff Board that the plywood industry should establish a research laboratory of its own. A Plywood Industry Voluntary Cess Committee was set up by the Government to collect funds for the purpose. In 1961, when adequate funds were available, the Indian Plywood Manufacturers' Research Association was formed which, with the assistance of the then Ministry of Industry and Supply and the generous support of CSIR, established the Indian Plywood Industries Research Institute in 1963 under the cooperative research scheme. Two field stations were also established, one in Calcutta in 1963 and the other in Assam in 1970.

The main problem facing the plywood industry is shortage of timber raw material. The present production of about 50 million sq. metres of plywood per year is far too little for a country of the size of India. Systematic studies are, therefore, carried out at the Institute on the optimum utilisation of veneer logs. Peeling, drying and gluing characteristics of timbers are studied and recommendations made to plywood factories on methods to maximise output. Special investigations on less used species of timbers have been initiated with a view to using them in panel industries.

Mycological and entomological investigations at the Institute are aimed at the protection of wood, wood-based materials and other lignocellulosic materials. It is estimated that up to 30 per cent of the timber harvested in forests is lost during transit and storage due to physical and biological deterioration. Prophylactic treatments developed at the Institute are being used by the plywood industry to protect veneer logs.

Development of adhesives

The present level of sophistication in the woodbased panel industry throughout the world is mainly due to the synthetic resin adhesives. These have always been costly in India and became even more so after the oil crisis The development of suitable adhesives for plywood, particle board and allied materials has been a major task before the scientists of the Institute. The dependence on petroleum-based synthetic resin adhesives has been reduced considerably by the use of blends of synthetic resins and proteinous materials such as defatted groundnut meal, sal seed meal and gluten. Tannin-based adhesi[illegible] were specially formulated for [illegible] plywood industry when urea-f[illegible] maldehyde and phenol-form[illegible] dehyde resin adhesives were [illegible] available in adequate quantiti[illegible] Adhesives formulations develop[illegible] in the Institute are widely employ[illegible] in the plywood industry. Work [illegible] adhesives is continuing in order [illegible] reduce costs further.

Development of particle boa[illegible] suitable for tropical climates is [illegible] progress. The most recent and imp[illegible] tant achievement in this field is [illegible] development of rice husk boa[illegible] suitable for such exterior uses [illegible] roof and wall cladding and also [illegible] secondary structural mater[illegible] Special adhesives were develop[illegible] at the Institute to bond rice husk i[illegible] strong, water resistant panels. T[illegible] boards are resistant to decay, insec[illegible] termites and fire.

Tea Chests

The annual production of tea [illegible] India is about 500 million kg, alm[illegible] the whole of which is packed in p[illegible] wood tea-chests. Plywood for t[illegible] chests is manufactured mostly [illegible] small units. The Institute p[illegible] special attention to their requi[illegible] ments of adhesives, quality cont[illegible] and standardisation.

The Institute designs, fabrica[illegible] and supplies to the industry vari[illegible] instruments for quality and proo[illegible] control. The use of veneer la[illegible] adjusting instruments supplied [illegible] the Institute has greatly improv[illegible] the quality of plywood. Instrume[illegible] for temperature and moisture co[illegible] tent measurement have also be[illegible] developed.

An important activity of the In[illegible] titute is the investigation of the ph[illegible] sical- mechanical properties

A house constructed entirely with Plywood.

*Joseph George is Director, Indian Plywood Industries Research Institute, Bangalore.

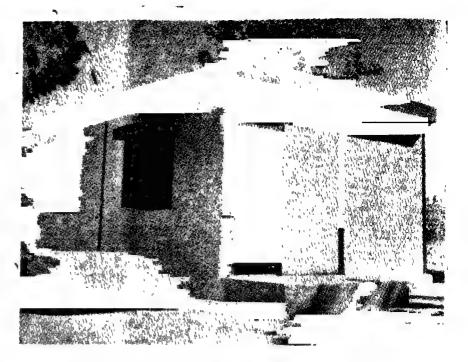
plywood, particle board, hardboard and other wood based panels. Test procedures are rationalised and new methods are developed. Design data for plywood for different end uses are being made available to engineers and builders Non-destructive test methods are developed for strength and quality control in timber and timber products

Structural Grade

A notable contribution made by the Institute is the introduction of a new grade of plywood, namely, structural plywood for construction purposes. Plywood as a structural material is almost unknown in this country The Institute gives great importance to developing various engineering uses for plywood and other wood-based panels. As a result, several glued wood-plywood laminated structural components such as stressed skin panels for roofing, wall systems, arch panels, web beams and portal frames have been designed and developed at the Institute. By making use of these components, several experimental structures have been constructed and some of them have undergone service tests for over five years.

Structural plywood treated with preservatives to protect it from decay, termites and other insects is used for construction work Waterproof and weatherproof structural adhesives developed at the Institute are used for the assembly of wood-plywood building components.

Investigations at the Institute have shown that plywood, hardboard and components made out of them are ideally suited for low-cost housing, particularly when used with a judicious combination of traditional building materials Comfortable houses costing Rs 150-200 per square metre of plinth area can be constructed using the techniques developed at the Institute. A few demonstration houses using plywood and hardboard have been built

Preservative-treated exterior grade structural plywood is the ideal material for the fabrication of mini-structures like milk booth, pavement stalls, kiosks and bus shelters These structures, which are of a knock-down type, are portable and can add interest to the street-scape in towns and cities as they can be given a variety of interesting shapes. Several small structures have been designed and fabricated at the Institute from four mm thick plywood and wood.


This house has a roof made by Rice Husk Board

Low Cost Housing

It is estimated that the housing shortage in this country runs into several million, mostly in the rural areas. The chief obstacle to the construction of rural and low-cost houses by the million is the absence of a suitable roofing material. The use of high energy materials like tiles, bricks, cement and steel is virtually ruled out in planning for houses by the million. Much thought has, therefore, been given at the Institute to the problem of finding suitable roofing material so that a significant impact could be made on the housing problem

Work of an exploratory nature has indicated that rice husk board developed at the Institute can be used as roof cladding and also as secondary structural material for building large number of houses in the years to come The cost of such houses can be in the range of Rs. 100 to Rs 180 per square metre (Rs 10 to Rs 18 per sq ft.). An experimental house of 25 square metre plinth area constructed at the Institute premises is presently undergoing service tests. The inherent resistance of rice husk boards to termites and fire and the fact that 17 million tonnes of rice husk is produced annually in the country make rice husk boards a most promising roofing panel for mass housing. The potentialities of rice husk boards in housing and in construction in general are very vast.

Continuing the search for still lower-cost roofing materials m[...] from resources which are themselv[...] available in large quantities, t[...] Institute has recently develop[...] roof made of preservative-treat[...] wood veneers It is visualised th[...] by making use of non-utilis[...] wood species from forests and woo[...] residues available from the woo[...] industries, a million houses, eac[...] of about 25 square metre plinth are[...] can be constructed every year b[...] adopting the technique developed [...] the Institute. Non-utilised speci[...] of timber can also be used for th[...] farming of these houses Preserva[...] tive treatment by the dip diffusio[...] method will make it possible t[...] treat and use most species of ade[...] quate strength A factory produci[...] the treated veneer and wood situate[...] centrally can supply the roof fram[...] and veneers as a package over a[...] area of 800 km radius at a littl[...] extra cost. Roof panels can als[...] be prefabricated and supplied [...] wood veneer roof and framing manu[...] facturing factory will require manl[...] saw milling equipment and a venee[...] lathe.

A rural type house having treat[...] ed veneer as roofing is estimated t[...] cost about Rs. 80 to Rs 100 pe[...] square metre (Rs. 8 to Rs. 10 pe[...] sq. ft.). The veneer roof shingles ar[...] expected to give a service life of ove[...] 20 years, at the end of which the[...] can be replaced.

Further, the Institute has collec[...] ed information on the protection o[...] thatch and bamboo traditionall[...]

used in rural housing in the country. Some experimental investigations have also been carried out on protection of thatch, bamboo and wood poles against decay, insects, termites and weather. Adequate expertise is now available at the Institute for guiding interested parties for enhancing the service life of thatch roofs which, otherwise, usually last only one or two years.

Providing functionally suitable door and window frames and shutters at a competitive cost is another problem in lowcost housing, low-cost door and window frames of laminated constructions have been developed at the Institute from small dimension wood, plywood and hardboard. These frames and shutters are strong and durable and functionally adequate. The techniques of making such frames and shutters eliminate the need for time-consuming traditional carpentry joints.

Grain Storage Bins

The design of economical scientific storage systems for foodgrains is a project of national importance. The Institute has designed grain storage bins of capacities ranging from one quintal to 60 tonnes from plywood to meet a variety of end use requirements such as small, medium and relatively large capacities, indoor and outdoor types, cylindrical and rectangular, prefabricated, knockdown and portable varieties and for *in situ* constructions. Several of these bins fabricated at the Institute have been evaluated by organisations through out the country.

Functionally and structurally plywood bins are ideally suited for the domestic and rural sectors. Costwise, plywood bins offer the cheapest means of scientific storage of grain. The preservative-treated plywood, used for bins, is water proof, weather proof, decay resistant, insect proof, termite proof and resistant to rodents.

Small capacity plywood grain storage bins may also be designed as multipurpose bins which can serve as an item of furniture like a bench, diwan and bed or storage space. The Institute is now in a position to design and fabricate plywood bins of capacities up to 500 tonnes.

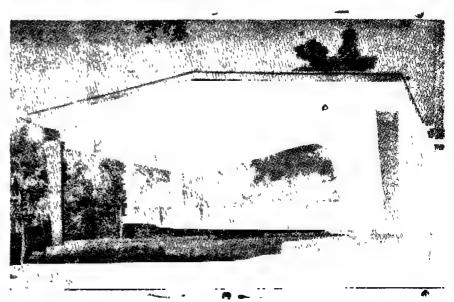
Storage tanks for chemicals and fertilisers have also been developed using exterior grade plywood. Their special advantage is resistance to corrosion.

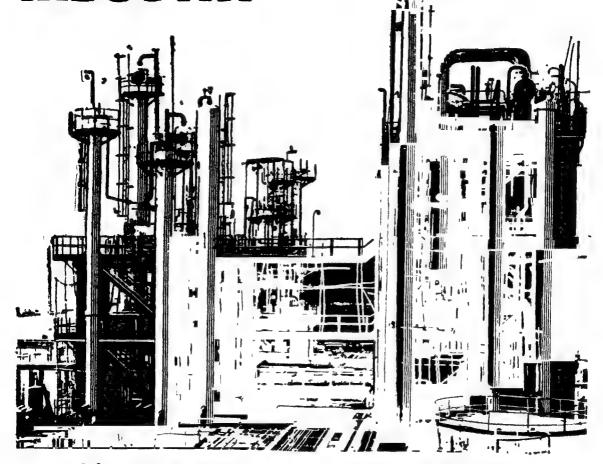
A wide range of plywood knockdown furniture like tables, cots, sofas, wall components and wardrobes have been designed and fabricated at the Institute using 12 to 15 mm thick plywood. They are attractive, cheap and are made without fasteners and traditional carpentry joints. Such furniture can be dismantled, packed and transported easily. They are ideally suited for the rural environment. The village craftsman can fabricate such furniture using basic carpentry tools.

A well trained team of scientists and engineers of the Institute carry out extension work in plywood factories and help the industry successfully to implement the processes developed at the Institute.

It may be emphasised that because of the close contacts between the industry and the Institute there is no communication gap between the technical personnel of the industry and the scientists of the Institute. The programme of Research and Development work of the Institute is formulated in consultation with the industry.

A Pre-fabricated Milk-booth of wood and Plywood

This Pre-fabricated Plywood roof is supported by prefabricated portal frames of wood and plywood.




Structural Engineering

RAPID INDUSTRIALISATION of the country calls for a large volume of building activity and construction activities of all types account for a large expenditure. It is conceded by all cotncerned with the building industry hat a saving of atleast 10 percent of the expenditure can be affected if concerted steps are taken to modernise our design methods and construction techniques.

To make the country self-sufficient in modern structural engineering skills, the Council of Scientific and Industrial Research (CSIR) established Structural Engineering Research Centre (SERC)at Roorkee in 1965 As the National Laboratories can effectively reach the end users only through the medium of well-organised and well-equipped regional centres, a Regional Centre was set up at Madras in 1966 To day, the SERC functions from its two Campuses at Roorkee and Madras which have complementary functions and facilities

The broad scope and functions of the Centre are.

1 To act as an information bank of all the latest available knowledge and knowhow relating to the design and construction of buildings, bridges, and other structures such as transmission lines, television and microwave towers, chimneys cooling towers, machine foundations, electricity poles, pipes, sleepers and nuclear containment pressure vessels;
2 to undertake application-oriented research on all aspects of structural engineering in consonance with national priorities;
3 to accept research and development work from other organisations in the public and private sectors, especially in developing complicated structural designs involving the use of digital computation, tests on scale models and prototypes for undertaking which the run-of- the-mill design offices in the public and private sectors have no facilities. Its role will be to act as a consultant to consultants and others;
4. to undertake turn-key consultancy assignments in India and abroad, particularly those involving the design of industrial and residential colonies, bridges, and other transportation structures by forming ad-hoc consortia with other national laboratories under the CSIR and other private sector consultancy and construction organisations; and
5. to organise, from time to time short-term specialized courses in structural engineering with a pronounced practical bias for the benefit of practising engineers to expose them to new ideas and developments in design and construction.

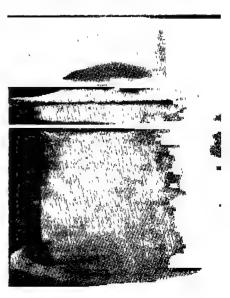
ACHIEVEMENTS

Reinforced Concrete

Some of the major research programmes at the Centre are aimed at modernising the design and construction of reinforced concrete structures in India by bringing them in line with the current practices in other countries of the world so that money and materials are saved. A case study showed that the use of ultimate strength design and the high yield strength deformed bars in place of mild steel as concrete reinforcement would result in substantial economy in reinforced concrete structures. Although these techniques had the sanction of the relevant Indian standard codes of practice, the design engineers were rather reluctant to make this change over for the simple reason that they did not have readymade design aids for use in the design offices. A multi pronged approach was therefore made to encourage the engineers to use the modern techniques. To expose design engineers to these new techniques a series of workshops were organized for them in collaboration with the National Buildings Organisation, New Delhi; an Ultimate Strength Design Handbook containing time saving, labour saving and ready-to-use tables and charts was brought out so that design engineers would not be reluctant to make the change over from elastic to ultimate design. This handbook has proved very popular and there i[s] a constant demand for it.

The Centre's work on researc[h] and development of an indigenou[s] high yield strength deformed ba[rs] known as Grip Bar for concret[e] reinforcement in place of mild stee[l] is one of the major achievement[s] and has brought good results. Apa[rt] from effecting on an average 30 pe[r] cent savings of steel for the nation the indigenously developed Gri[p] Bar is a superior substitute for [a] proprietary reinforcing bar pro[-]duced in India with foreign colla[-]boration. It was largely due to th[e] initiative and sustained effort[s] of SERC that the deformed bars—both hot rolled and cold worke[d] varieties—are now being manu[-]factured in the country. The deve[-]lopment of Grip-bar for concret[e] reinforcement by SERC also merite[d] the award of a Silver Shield for 196[?] by the Board of Awards on Impo[rt] Substitution.

Steel is the backbone of a growin[g] economy and savings in steel is essen[-]tial to widen economic activities One of the answers is the shell roo[f] construction. An important achieve[-]ment of the Centre in this field is th[e] development of a new form of shel[l] known as the funicular shell. Thes[e] shells, when used as roofs, can b[e] built even of country bricks withou[t] any steel Such brick shell roofs o[f] large sizes have been built to roo[f] the buildings of the National Insti[-]tute of Design at Ahmedabad an[d] the Regional Centre of SERC a[t] Madras. The funicular shells ca[n] also be used for roofs and floor[s] effectively with considerable savin[g] in steel. The heavy loading platform

This grain storage bin of 25 tonnes capacity is made exclusively of plywood.


built at the Madras Port and the Workshop floors for the National Institute of Design at Ahmedabad are examples of this application. The continuous research and development on the use of these shells have resulted in a new system of roofing and flooring known as the waffle Shells. This system of construction replaces the conventional reinforced concrete slab with savings in steel to the extent of 40 per cent.

The need for updating of Indian Codes of Practice for reinforced and Prestressed Concrete—which sanction the use of ultimate strength design procedures—is far more urgent today, as the specifications of these codes have direct relevance to the use of steel in the construction industry. However, the current provisions in the code on ultimate strength design do not adequately cover many of the important aspects of the several design criteria. It is, therefore, timely and appropriate that the codes are revised in the light of current research to make them more rational and to bring them in line with the latest thinking on the subject. The Centre has undertaken to revise the Indian Codes for Reinforced and Prestressed Concrete in the light of the International recommendations of CEB-FIP.

Based on the studies carried out at SERC, detailed recommendations have been made to the Indian Standards Institution for revising the Indian Standard Codes of Practice for Structural Concrete, along with a clause-by-clause commentary on the code recommendations explaining in detail the various clauses. With the adoption of these recommendations, the design methods will become far more rational, comprehensive, consistent and will result in more efficient and economical structures.

Gr. in Storage Structures

The available data on the design of silos are meagre and controversial. To fill the gaps that exist in the knowledge of the bin loads and to collect data for safe and economical design of silos for storing various foodgrains, an extensive experimental investigation was undertaken at the SERC.

A square silo model was designed and fabricated to ascertain the loads exerted on its wall during filling, fully filled and while emptying conditions. Tests, with paddy and wheat as filling were conducted. The results of these tests showed that the critical wall pressures occurred in silos during emptying operations which were more than those recommended in the present Indian Standard Code on silos. Based on the results of these studies suitable pressure schemes were recommended for the computation of silo wall pressures for the design of silos storing these materials

Computer programmes for optimum design of more commonly used cylindrical silos were also developed at the Centre.

The Centre was mainly responsible for drafting the first ever Indian Standard Code on the "Criteria for the design of reinforced concrete bins (silos) for bulk foodgrain storage'. The Centre also assisted the ISI in recasting this Code to cover the design criteria for reinforced concrete silos storing various powdery and granular materials in addition to the foodgrains The SERC also assisted the ISI in drafting another code for steel silos and bunkers.

Transmission Line Towers

Transmission line towers, television towers and microwave towers which serve as the nerve centre of our communication system are being built in large numbers all over the country today It is thus obvious that even slight economy by way of their design can result in colossal savings The conventional methods of analysis and design of these structures are incapable of handling such complex structures. But the optimum design of towers developed at the SERC provides an answer It is now established that by using the computer programmes developed at the SERC savings upto 10 per cent in the weight of steel can be realised. It is also estimated that if the optimum designs of towers perfected by the SERC are widely adopted, large savings can be affected The Centre acted as consultants to Triveni Structurals Ltd. for reviewing the designs for the TV towers at Bombay Transmission line towers for various State Electricity Boards and microwave towers for P&T Deptt of Government of India were also designed

Ferrocement Bins for Rural Areas

About 65 to 70 per cent of the total foodgrain production in the country is stored at the rural level in traditional and unscientific storage structure resulting in enormous losses. Realising this the centre undertook the development of small capacity ferrocement bins. Research work carried out at SERC has resulted in the development of ferrocement bins of ½t, 1t, 2t and capacities which are cast by a simp process calling for only village le skills. The process has been pate ed and released through the Nati nal Research Development Corp ration of India (NRDC), New Del Depending on the individual co sumer's requirement 1, 2, 3 tonne b may be assembled by erecting o two or three wall units one over t other and filling up the joints w cement mortar. These bins a strong, light, durable and are fi proof, damp proof and rodent pro and pose no recurring maintenan problems. Evaluation tests carri out on these bins at the Centi Food Technological Resear Institute (CFTRI), Mysore ha demonstrated their function su ability to store foodgrains.

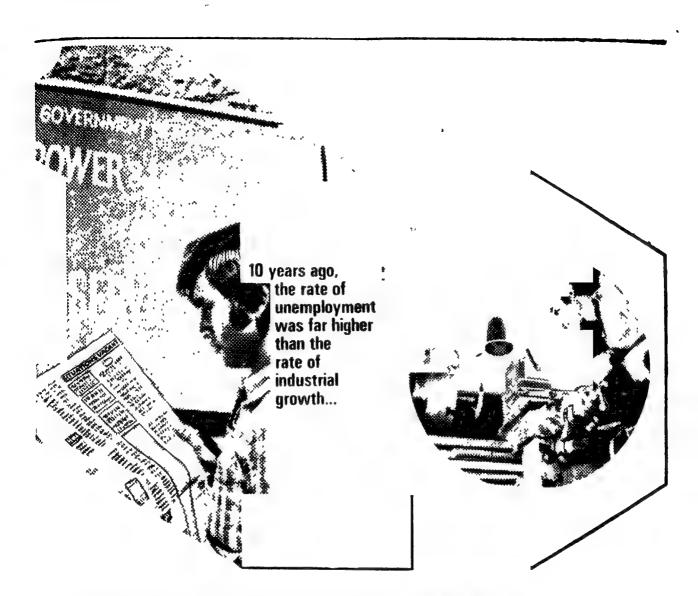
With steep rise in the oil pric during the last few years it h become necessary to tap alternati sources of energy, namely, the eno mous amount of biological wast especially cow dung, available the countryside. To achieve t objective it was necessary to devel economical designs for biogas plant especially for the gas holders. T research project for the develo ment of ferrocement gas holders f biogas plants has been sponsor by the Department of Science ar Technology, Government of Ind as a part of the All India Coord nated Project on Biogas. A typic design of a 3cu. m plant incorpora ing the above features showed th savings of more than 30 per ce could be achieved over the conve tional designs. Further, develo mental work is in progress.

Utility Computer Programmes

The SERC has developed utili computer programmes for the anal sis and design of 'repeat' structure Today structural engineers all ov the country use these results of r search in designing such complica ed structures as multi-storeyed bu dings, prestressed beams, shell roof folded plates, grids, and transmis tion line towers in an amazing short time. A problem oriente language has also been develope at the Centre to facilitate use of t digital computer by structural e gineers for the analysis of structure The SERC has also developed com puter programmes for such advan ed management techniques as Cri cal Path Method (CPM) and Pro ramme Evaluation and Revie Technique (PERT). The utili programmes of the Centre are in con stant demand by the profession □

10 years ago, the rate of unemployment was far higher than the rate of industrial growth...

TIMES HAVE CHANGED.

Today, petrochemicals supplied by NOCIL are helping to widen the industrial base, provide more jobs.


Petrochemicals from NOCIL provide the basic raw materials to many downstream units, the majority of which are formulators and processors in the small-scale sector. As a major supplier of raw materials, NOCIL is aiding industrial growth and thus generating more employment for our people.

In this and other vital areas like food, clothing, footwear, health and power—NOCIL is supplying raw materials, and providing technical services to develop new product applications and effect import substitution, particularly in the small and medium scale sectors. Thus giving them the means to grow and diversify, and to help fulfil the basic needs of the common man.

IN 10 YEARS OF OPERATION,
NOCIL HAS HELPED CHANGE THINGS FOR THE BETTER.

CHAITRA-NOCIL-42

Research at Roorkee

Prof. Dinesh Mohan
P. L. De

SYSTEMATIC RESEARCH in the field of building science started in India in 1947 with the establishment of a Building research Unit at Roorkee under the Council of Scientific and Industrial Research. It grew into a National Laboratory in 1951 when it was named as Central Buliding Research Institute. The initial objective was the improvement of traditional materials and construction methods and to develop new ones.

During the two decades of fifties and sixties, considerable research and investigations were carried out on building materials, engineering and structural aspects of buildings and their foundation, problems of comfort in buildings and their durability The activities also included basic research and fundamental studies coming within its purview such as X-ray studies and differential thermal analysis of clays and their electro-chemical and rheological properties, stress and strain in structures The Institute afforded facilities for training of personnel for diverse types of construction and helped various construction agencies in adopting new tecniques and materials of construction. It also carried out industrial surveys and dissemination of scientific and technical information through a well organised information service

The success of CBRI in developing low-cost construction techniques attracted the attention of several large construction agencies, particularly in the public sector. These agencies were eager to adopt these techniques in a big way with a view to substantially reducing the cost of buildings, specially repetitive types like schools, health centres, which were to be constructed in large numbers all over the country. This offered an excellent opprtunity to the Institute to get some of its findings implemented in a big way. The Government of Uttar Pradesh came forward to entrust the construction of 5,000 primary school buildings in rural areas to the CBRI The Institute took up this challenge and diverted a considerable portion of its manpower to this School Building Project, involving an outlay of the order of Rs. 50 million. It completed the constructions establishing a saving of the order of 20 per cent in cost and 50 per cent in the time of construction. Similarly, for health buildings for U P. under the World Population Project the Institute has designed and assisted in the construction of a large number of primary health centres, family planning centres, sub-centres and allied buildings

Demand for New Techniques

With the successful completion of the two major sponsored projects on school buildings and health buildings the Institute has gained the confidence of many mojor construction agencies in the public and private priate sector and they are approaching the Institute for help in demonstrating the new low-cost construction techniques and training their engineers by undertaking a sizeable portion of their construction programme. This has necessitated the creation of a separate Construction Unit which has started functioning towards the end of 1975. The Extension Cells of the Institute located at Calcutta, Bhopal, Ahmedabad, Hyderabad and Delhi, which were set up a few years back have also been put under this Construction Unit.

Thus, the work of the Institute is new organised in 9 Division namely (1) Building Materials, (2) Soil Engirlls (3) Efficiency of Buildings (Building Physics), (4) Building Processes, Plant and Productivity, (5) Architecture and Physical Planning, (6) Fire Research, (7) Rural Buildings, (8) Information, Survey and Planning and (9) Construction and Extension Unit.

Major Contributions

During the three decades of its existence the CBRI has contributed towards the development of the building industry in various ways and has now established itself not only as a picneer Building Research Institute in India but as one of the leading Building Research Organisations in the world. The expertise of the Institute is now being utilized not only in India but in several other developing countries. Some of the major contributions of the Institute during the last 2 to 3 years are highlighted here.

Pile Foundations

The Institute developed the technique of short-bored under-reamed and compacted concrete piles as an effective, safe and economical foundations in expansive black cotton soils and loose sandy soils. Besides giving stable foundations to the buildings, these piles cut down conventional foundation-cost by 20 to 30 per cent. Nearly, 35,000 crack-free buiedings have so far been constructed on these fonndations all over the country saving several crores of rupees to the nation. More and more buildings, transmission line towers, microwave towers' overhead tanks, bridge piers and a variety of other structures are being built on such piles.

These techniques are gaining popularity even in the developing countries The 63 km long, 132 KV Transmission Line in Dubai (U.A E.), for the foundation of which this Institute is a consultant, would be coming up on these piles British consultants on the project have been convinced of this technology.

Successful completion of the ground under-pinning operation as a measure of rectifying the foundation of Ammonia Tank at Cochin is another feather in the cap of the Institute about which not only the Institute but the country could be proud of. The Ammonia tank 40 m in dia meter and 17 m high was supported by a thin R C.C raft resting on concentrically placed 217 number cast-in-place concrete piles. This tank which was designed for a capacity of 10,000 tons, failed when test loaded to little over 8,000 tons. The German firm which was the consultant suggested shifting the tank to some new location and reducing the foundations. This operation alone was to cost 65 lakh rupees excluding the cost of new foundation, which was estimated at 40 lakhs (in foreign currency). Construction time was stipulated as 18 months. This Institute analysed the causes of foundation failure and came out with a proposal of underpinning the tank at a cost of only 37½ lakh rupees all in Indian currency, while other firms

Prof. Dinesh Mohan is Director and Shri P.L. De is Scientific Coordinator of CBRI

in India quoted 60-80 lakhs for the job. The proposal of the Institute required only seven months for execution. It was based on the concept of compensated foundations. It was decided to lift the settled tank back to the position by simultaneously operating 400 jacks. The German consultants were opposed to the idea because it was impracticable in their view. The Institute took a firm stand on its proposal, deputed its own scientific staff right through the execution of the rectification works, monitored the behaviour during the test loading and completed the assignments successfully in record time. Thus on this project, the Institute saved the country a foreign exchange to the tune of about 65 lakhs by providing an ingenious and bold solution which baffled other consultants including foreigners at the implementation stage.

The Institute is now fully geared to tackle all kinds of challenging assignments in foundation engineering effectively, expeditiously and economically. It can offer consultancy the foundation engineering which, hitherto required the services of foreign experts.

For providing an effective cut-off for seepage waters, a simple process of constructing a thin diaphragm wall has been evolved by the Institute. It has been successfully used at 15 sites in U.P. including Sarda Sahayak Pariyojna. On this project, diaphragm walling was adopted as an alternative to steel sheet piles which are often imported. The technique effected a saving of about Rs. 60 lakhs.

Systems for Low Cost Housing

(a) *Concrete Skeleton System* Greater stress is being laid on housing for the economically weaker sections of the society under the rural development programme. Since most housing schemes for such people envisage the use of aided-self-help, the concept of construction in stages with durable support and roof in the form of skeleton is more suitable. The concrete skeleton system consists of recast pocket footings, hollow columns, beams, joists and D.C. tiles. Th system was adopted for construct on of 42 houses in Karimnagar district n Andhra Pradesh.

(b) *Prefab Brick Panel System* : It provides a very economical and speedy system of construction. This system was used by:

(i) Rural Engineering Services Deptt. of U.P. for Harijan Housing,

(ii) Ghaziabad Improvement Trust for constructing 1550 houses for these people are also being constructed nowadays,

(iii) A housing colony for landless labourers in Village Sunehra (U.P.).

(iv) Bengal Engineering Group for constructing 52 houses for their jawans,

(v) U.P. Avas Nigam for constructing 50 Refugee houses at Hastinapur (Meerut).

Besides, Harijan Avam Nirbal Varg Nigam in U.P. has agreed to adopt this system for constructing Harijan Houses in U.P. In the first phase 18000 houses are proposed to be constructed. U.P. Avas Nigam has adopted the system for 100 houses for E.W.S. and 600 houses are to be constructed in the near future by Rural Engineering Services Department U.P. 200 houses are under construction at Ahmedabad for E.W.S. by the Gujarat Housing Board.

(c) *Stone Masonry Blocks* : A scheme of producing precast stone masonry blocks of 30 cm x 20 cm x 15 using stones upto 12 cm size and lean cement concrete mix has been developed at the Institute. These blocks have one face with stone texture and weigh about 21 kg. These can be easily produced at factory or at site in timber or steel moulds with ordinary labour

This technique has been adopted by (a) Rajasthan Housing Board–over 120 houses; (b) Himachal Pradesh Housing board 100 houses; (c) Delhi Development Authority – 28 houses; (d) Andhra Pradesh Housing Board – 120 houses ; (e) A.P. Police Housing Corporation – Police Rest House; (f) A.P. Zila Parishad Karimnagar 100 Panchayat Ghars; (g) U.P. Housing Board – 26 houses; (h) U.P. School Buildings in Hilly regions – 2 numbers and (i) Madhya Pradesh Housing Board 200 houses

Health Centres and Rural Schools

The designs and techniques of the Institute have been adopted for the construction of more than 600 Health Buildings costing Rs. 5 crores in six districts – Saharanpur, Muzaffarnagar, Lucknow, Sultanpur, Rae Bareily and Partapgarh in U.P. These Health Buildings include among others, Primary Health Centres, sub-Centres, Family Planning Centre, Maternity Homes and Auxiliary Nurse Mid-wife Training Centres.

The recommendations of the Institute on Planning and designing of such health buildings will be further utilised for the plannig of other standard buildings required by the Government of India for Health and Family Planning in the country.

After the implementation of massive school building programme of constructing about 2500 houses, in Uttar Pradesh, Government of Orissa has shown interest in the new techniques of construction evolved by the Institute. In the first instance 30 prtotypes of school buildings and three types are being put up. After their evaluation the State Govt. will adopt one of the types as their standard design for the State.

The Institute has designed and developed a number of designs for prefabricating roofing and flooring units which lead to economy in cost and time. Besides, they consume less cement and steel as compared to conventional R.C.C. slabs. These prefabricated roofing schemes have been adopted in several large projects in Bhopal, Delhi, Ahmedabad and other places.

Bricks from Inferior Soils

Black cotton soil is not suited for brick making. Bricks moulded from such soils develop cracks during drying and possess very low strength The Institute has found a solution to this problem where about 20 per cent of 'grog' (particially calcined soil) is added as an opening material. This reduces the elasticity of the soil, prevents cracking of bricks and also improves its strength Brick kilns, using this technique, are successfully operating at Indore and Bhopal with the cooperation of the Madhya Pradesh Housing Board and Capital Project Authorities Several private industries have also adopted the process

Huge quantities of industrial and agro-industrial wastes such as flyash, slag, coconut fibre, rice husk and lime sludge are available in our country. Some of these pose a serious problem of disposal. The Institute has found the following uses for these materials

(i) Flyash for making cement, concrete, sintered aggregate, clay bonded flyash bricks,

(ii) Slag for masonry cement,

(iii) Coconut husk for making corrugated roofing sheets and partition boards;

(iv) Rice husk and lime sludge for making cementitious binders and building boards

Solar energy is abundantly available in the country. With a view to utilising it, the Institute has designed and fabricated solar water heaters for domestic use and for use in large establishments such as canteens, hospitals etc. Domestic solar water heaters designed by the Institute are now being commercially manufactured in the country.

The Institute has at present 100 research projects in hand, out of which 16 are sponsored by the industry, besides several consultancy projects.

The research results are published in the form of research papers in Indian and foreign journals while the new ideas of design, construction techniques and materials are popularised through Data Sheets, Building Digests, Building Material Notes and Technical Notes, published by the Institute. Advance summaries of papers sent for publication are brought out in the quarterly CBRI Abstracts.

Consultancy Services

Besides undertaking sponsored projects, the Institute renders testing and consultancy services to the industry and construction agencies. The newly started Construction Unit and the five Extension Cells (Ahmedabad, Bhopal, Calcutta, Hyderabad and Delhi) attached to it are particularly geared to undertake sizeable demonstrations for the construction departments in the public as well as private sectors and to train their field staff and engineers in the adoption of new techniques. The Institute maintains excellent Information, Documentation, Reprography and Library Services not only to serve the scientists of the Institute but to extend it to the Industry. Training facilities are also provided to nominees from industry as well as students and teachers from technical institutions.

Perspectives

Out of the total Plan outlay of over 55,000 crore rupees in the Fifth Five Year Plan about 4,500 crore rupees will be spent on housing alone. Besides, huge amounts will be spent on other types of buildings like edudational buildings, and storage buildings. It can be roughly estimated that out of the total Plan outlay about half goes to constructions of one type of building or the other. Particular stress is being given in the Fifth Five year Plan towards rural housing. Building Research must, therefore, of necessity, be concerned with the problems which are expected to be of interest to the industry and the users even ten to fifteen years hence. With this end in view, a perspective plan for research at the Institute for the next ten years has been formulated after discussions with experts comprising architects, engineers and builders. The areas of study are broadly classified into Environmental Research, Materials and Fire Research and Engineering Research.

Huge quantities of rice husk is available in our country. These can be used to m[illegible] cementitious binders.

Pic. shows production of cementitious material from rice-husk

Under Environmental Research major projects will deal with the influence of environmental conditions on the thermal sensation of human being and utilisation of solar energy. Studies will also include spaces and their inter- relationship in residential buildings, modular coordination and building byelaws. Urban planning studies will include formulation of density patterns and land use pattern of new housing developments.

Under Materials Research a wide range of materials will be covered with the main objective of improving the quality and productivity of conventional materials and developing new ones. Special emphasis [illegible] be given to the development of l[illegible] weight materials, utilisation of a[illegible] cultural and industrial wastes [illegible] use of plastics.

Fire Research will be consider[illegible] srengthened with the installa[illegible] of large furnaces for testing [illegible] scale building components.

Engineering Research will [illegible]clude major projects on soil-st[illegible]ture interaction, soil anchors, che[illegible]cal grouting, industrialised bu[illegible]ing techniques, cellular and li[illegible] weight concrete construction, met[illegible] studies on building operations [illegible] various types of rural cons[illegible]tion.

Alongside the development of [illegible]search activities, auxillary scie[illegible]fic services like Extension, l[illegible] size demonstrations, Informa[illegible] and Survey, Industrial Liai[illegible] and general technical services [illegible] workshop facilities procuremen[illegible] equipment and stores, will have [illegible] be expanded to meet the incre[illegible] need of the scientists and to rea[illegible] better and quicker utilisation of [illegible] results of research for the be[illegible] of the Nation.

Impressive Work in Cement Research

THE CEMENT Research Institute of India (CRI) was visualised almost two decades ago, conceived in 1962 as a national R&D centre based on co-operative principles and started functioning towards the end of 1966 with the setting up of its nucleus in Delhi.

The main laboratories of the Institute are located at Ballabgarh in Haryana, 30 kilometres from Delhi. A pilot cement plant with various auxiliary machinery for unit operations capable of use both individually and collectively, is located at Muduvathur near Tiruchirapalli in Tamil Nadu.

The organisational arrangement of CRI has been conceived on the basis of the Matrix Method of R & D Management by Objectives The management structure consists of the infrastructure and the operational structure The infrastructure, in turn, has three distinct limbs, namely, the faculties, the facilities and the services and management controls The operational structure, on its part, has two distinct limbs, namely, the technology generation and the technology transfer activities The essence of the matrix system is to bring out a conceptual distinction amongst the various activities of the Institute whilst retaining the infrastructural wholeness of the talent, equipment, environment, technical and general services and controls, and achieving fulfilment of the objectives through a balanced integration of these inputs on the basis of non-hierarchical multi-dicisplined teams working to time and cost targets. The physical units which make up the infrastructure form a separate entity by themselves, similarly the independent testing activity forms a separate part of the operational structure.

The ten faculties of the infrastructure, subjectwise, are geology and mining technology; raw materials, silicates and lime technology; design and development of plant and machinery; process engineering; cements, asbestos cements, and industrial and agricultural wastes utilisation technologies; packing, handling and distribution of cement; concrete technology; concrete architecture; structural engineering; and construction technology.

Discipline-wise the faculties are, basic sciences; technology transfer sciences; industrial information and talent, development sciences; statistics and computer sciences; agricultural and rural technologies; management sciences; and industrial economics

Research Tools

The Institute has at its disposal some of the most powerful tools of research, such as electron-microscope, infrared spectrophotometer, atomic absorption spectrophotometer, X-ray fluorescence spectrometer, X-ray diffractometer, electron probe micro analyser, hot stage microscope, DTA-cum-TGA equipment, laboratory equipment and pilot plant facilities for various aspects of cement manufacture, equipment for non-destructive testing, test cylinder plant with pulsator, electrical, mechanical and acoustic strain gauges with data acquisition system, and photo-elastic apparatus for two-and three-dimensional studies. Meriting special mention in this regard are the multipurpose test rig and the controlled test rooms The test floor is served by an overhead crane of 10 tonnes capacity traversing the entire length of the floor The floor can take concentrated load of 100 tonnes at any point. The box section of the floor has five cells one of which is 4 1 metres wide and accommodates a 19 metre long, 300 tonne capacity pretensioning bed blanked by a hatch of over 22 metre length opening to the top surface of the test floor. The 400 metre thick flange of the reaction forms the deck for application of horizontal loads. The entire reaction due to this is transmitted to the test floor because of the integral construction of the well and the floor.

Large-scale horizontal loading, such as of earthquakes, wind, water or earth pressure can be conveniently simulated with the help of the reaction wall. The entire instrumentation system related to the use of the test floor could be monitored with precision dial gauges, electrical load cells and a modern 200-chanel data acquisition system. The test block is annexed to three of the engineering blocks which may use it for such diverse purposes as testing structural components, pre-tensioning for pre-cast concrete work and assembling/installing plant and machinery. There are ten controlled test rooms, with differing areas ranging from 20 to 98 m², and temperature and humidity combinations to provide test conditions characteristic of any part of the globe. With all the foregoing facilities in equipment, the Institute is now capable of effectively dealing with most aspects of materials science, design and technology relevant to cement, cement machinery, concrete and construction industries

The technical services of the Institute have two distinct parts – one dealing with materials management; and the other comprising workshop and laboratory services including machine shop, smithy, welding and glass blowing, carpentry shop, mould and reinforcement working areas, and instrumentation shop.

Functional Lay-out

The planning and layout of the building in CRI has been done on the basis of an integrated approach engendered by the matrix method, avoiding visible and marked geographical boundaries for the main divisions or departments. Accordingly, with regard to the equipment facilities, the layout provides for their installation, operation and use as a community of R & D facilities available for all in the Institute and not as parts of water-tight compartments or divisions. Likewise, the layout for centralised facilities for the materials management and the workshop services flows from considerations of efficiency. Lastly, the semi-open system of seating personnel, provided for in the layout and duly adopted, ensures maximum visual connection and opportunities for frequent interaction between all levels of staff engaged in similar activities and at the same time an atmosphere conducive to creative activity around the scientists.

The buildings comprise five two-storey blocks with reinforced concrete slabs, beam and column cons-

ruction. Precast ribs and skins ave been used in the floors and roofs. 'he exterior walls are of composite onstruction with precast reinforc-d concrete panels on the outside nd burnt clay bricks on the inside. 'he auditorium, with a 15 m x 5 m tage, has a seating capacity of 450. ts roof has been particularly design-d as a folded plate and special care as been taken of acoustics. While naking the most of the strength, ersatility and beauty of concrete, he buildings betray no attempt at eing spectacular for their own ake. In other words, they are rather nique in combining modesty, najesty and functional efficiency vith strength, boldness and charac-er. The design has been made exible to take on not only additions nd expansions but rearrangements f internal functions as future deve-opments may demand.

The Institute has already complet-d 156 R& D Projects out of which 3 were sponsored by industry and aid for. The Guide will at once nake for speed and economy in xploration consistent with reliable roving of the deposits. On the use f wastes, five techno-economic asibility reports have been made vailable for the manufacture of ortland pozzolana cement from yashes obtained from five thermal ower stations in the country. The nstitute has developed and stan-ardised rapid chemical and instru-nental methods of analysis for ement and its raw materials.

achinery Development

A break through has been achieved the design of mini cement plants nd the technology of cement manu-cture by vertical shaft kiln. Ac-rdingly, the 25 tonnes per day ant at CRI's Tamil Nadu Centre s been redesigned and restructur-and is now in regular production. e appropriateness of mini cement ants to the north-eastern region India has been shown. CRI has w taken up project work on mini ment plants at Garampani in sam and Nanded in Mahara-shtra.

Functioning as the nodal point for engineering design and develop-nt of the first 2,000 tonnes per y cement plant in the country, at instance of the National Com-ttee for Science & Technology CST) the Institute has examined various aspects, such as site lo-ion, transport problems and chinery specifications related to h a plant and made suitable ommendations to the NCST and the Government. CRI has prepared a document on the feasibility and engineering of medium and large cement plants in India.

Two draft standards on dimension-ing and design criteria for cement-rotary kilns and auxiliaries have already been issued at the national level.

CRI has provided the planning and engineering design for the ex-pansion of a cement plant in Sudan based on detailed on-the-spot studies conducted by two of its experts, and jointly with the prime contracting organisation.

The more common method of pac-kaging cement in India, that is in jute bags, entails seepage losses and risk of deterioration in quality due to moisture ingress. To over-come these drawbacks, CRI has developed 19 alternative designs of bags which are of composite cons-truction using jute, hessian, and a suitable plastic film, and have a specially designed value system. Extensive field trials on the bags have confirmed their suitability for practical use.

Formulation of a cement-based non-shrink grout for use in founda-tions for heavy machinery, such as centrifugal compressors and high speed motors is another major deve-lopment from CRI. Three large fertiliser complexes in the country have saved nearly three million rupees in foreign exchange through its use.

CRI has carried out dynamic analysis for a 170-metre high doubly-curved arch dam at Idikki in Kerala State for minimum reservoir level and for upstream/downstream mo-tion condition caused by an actual earthquake accelerogram. The adequacy of sheer keys was checked using the theoretical normal and sheer stresses obtained for the critical sections.

Two large fertilisers complexes in the country have adopted CRI's recommendations for concrete foun-dations in aggressive soil and subsoil water conditions with excessive acidity, sulphate and/or chloride concentrations, prevailing in their project sites.

CRI has evolved economic designs for reinforced concrete poles and prestressed concrete poles, for power distribution in rural areas, which have since been accepted by the Rural Electrification Corpora-tion Ltd. In the context of a stagger-ing annual demand of two million poles for power distribution in the country, a saving of Rs. 10 million is anticipated in manufacturing cost from the adoption of these designs.

Improvements suggested by CRI in the manufacturing techniques and testing methods of prestressed conc-rete railways sleepers have brought down the rejection rate of sleepers to between two and five per cent.

A rural house and a two-tonne capacity grain storage bin have been designed and prototypes construct-ed within the CRI campus, Ballab-garh. Not only are these based on locally available materials but also they call for the minimum use of skilled labour and time for cons-truction. The cost of the housing unit is approximately Rs. 2,700 and that of the bin Rs. 250.

A Place of Pre-eminence

The Cement Research Institute has acquired a unique combination of the latest in facilities, talents, skills, and experience. Measures by the scope of its planned missions and the volume of work already done, and its potential in terms of men (many of them internationally known) and materials, the Institute has carved for itself a pre-eminent place not only in the eyes of the indus-tries it serves but also among R&D institutions of its genre in the world.

The Institute has a technical in-formation service with a library, journals and translation and photo-copy facilities to help technology transfer from developed countries It has a purposive programme of traning personnel. A special scheme exists to help cement plants adopt R & D results of CRI. There is, besides, a standard reference service for calibration of testing equipment, supply of reference material, help to industry in sett-ing up testing laboratories and for personnel training in test methods CRI plays a vital role in standardisa-tion and quality control. □

"People always called me a crank, but. I didn't carry any resentment about that, because it is an excellent thing, a crank. It is not expensive, it is relatively non-violent, and it causes revolutions".

E.F. Schumacher

author of "Small is Beautiful"

Studies in Jute

THERE ARE three laboratories in India which are principally engaged in research and development pertaining to jute. Two of them, namely, the Jute Agricultural Research Institute in Barrackpore and the Jute Technological Research Laboratory in Calcutta belong to the Indian Council of Agricultural Research. The third laboratory is the Indian Jute Industries' Research Association (IJIRA), also located in Calcutta

The origin of IJIRA goes back to 1937, when Indian Jute Mills Association opened a research department which was subsequently expanded to a full fledged research institute In 1966, the Indian Jute Mills Association Research Institute was reconstituted as a separate entity under the patronage of CSIR. This new organisation, IJIRA, an autonomous Cooperative Research Association, registered under the West Bengal Societies Registration Act of 1961 is patterned on cooperative research associations for textile fibres, tea, cement and plywood.

The Association has as members jute mills and other factories connected with jute, such as makers of machinery, instruments, chemicals and auxiliaries, chemically finished jute products and so on. Since the income collected by voluntary subscriptions has not been adequate, the Government of India has from last year levied a compulsory cess on jute goods. The proceeds of this cess are disbursed by a Development Council which has been set up by the Government, the major amount being turned over to IJIRA. IJIRA also receives substantial monetary support from CSIR and from the Commerce Ministry, which sponsors projects. The present outlay on research and development comes to only about 0.21 per cent of the turnover of the industry, which is desperately competing with synthetics and rival productes of jute goods

Decorative jute fabrics prepared through techniques evolved by IJIRA

Research Areas

IJIRA has mounted a multi-pronged effort to develop better strains of jute with higher yield; evolve special biological techniques for improving the results of natural retting; evolve a technology of treatment of jute with various chemical additives for improving the spinning behaviour and reducing odour and toxicity of jute goods; simplify the existing preparatory sequence for jute and reduce the number of machines involved, while improving the regularity in processing; develop radically new technologies for spinning jute; improve the productivity of jute looms by adaptations of the technology of weaving yarns from other fibres; improve the performance and reduce the cost of selected jute products, in order to make them more competitive for international and domestic markets; evolve a range of new products from jute such as decorative and furnishing fabrics, yarns and cordage, unions of jute and synthetics in order to diversify the usage of jute; introduce quality, process control and standardisation into this industry; and design a range of testing instruments especially adapted for jute goods.

Several of IJIRA'S results of great value in cost reduction, quality improvement and product diversification have already been implemented by the industry. It would be realistic to claim that the industry can gain between Rupees five and ten crore per annum by implementing the findings of IJIRA.

The future programme of IJIRA is to strengthen its activities in technical consultancy, quantitative management techniques and machinery design. It is also planned to institute studies in industrial psychology and behavioural sciences in order to see how the winds of innovation and change can be made to sweep through this tradition-ridden industry. □

TEXTILE RESEARCH—2

Man-Made Fibres

J.G. PARIKH

THE SILK and Art Silk Mills Research Association (SASMIRA) came into existence in 1950 as a Cooperative Research Association of man-made textile industry in India, under the auspices of the Council of Scientific and Industrial Research (C.S.I.R.).

The man-made fibre weaving industry consists of a number of small units most of them set up for a single process. The technical and testing services initiated as one of the first activities of SASMIRA continue even today as one of its important activities.

Various fibre and fabric defects that develop during the process of operations hamper the productive efforts This results in the distortion of the quality of the product. SASMIRA helps in the overall improvement and re-organisation of man-made fibre fabric units from the preparatory to the finising sections thereby strengthening and improving the technical base at every stage of production.

Standardisation

Research and Development work on indigenous fibres and fabrics has helped standardisation of yarns and fabrics. Basic research had been carried out in improving the resistance of polyamide fibric to sunlight to suit the tropical climate in India. Study of utilisation of indigenous auxiliaries for man-made textile has helped in promoting use of these auxiliaries in the Industry.

At present nylon georgette fabrics are fixed on the screen printing tables with pins involving considerable amount of time. Moreover, unless the pins are fixed very close to each other, some distortion of fabric is inevitable resulting consequently in distortion of the printed design. SASMIRA has indigenously developed a suitable adhesive for fixing the cloth on the table and its use for a number of printings of the same design This adhesive has helped in saving considerable amount of time resulting in increasing productivity and in production of damage free printed fabrics

The organisation has been developing different types of man-made fibre fabrics for defence and industrial uses. Among the fabrics developed for defence requrements are acetate map cloth, nylon wind breakker fabrics, nylon body armour cloth, foam backed fabrics, nylon parachute, dual shade nylon fabric etc. The fabrics developed for industrial use are nylon filter fabrics for the tea industry, viscose tyre cord yarn fabrics, viscose tyre cord jute union fabrics for furnishing.

On a machinery modification programme, Sasmira has made modifications of an indigenous automatic loom for weaving of high density polythlene Work was also done on the development of glass fibre fabric

Instrumentation

One of the most important contributions is in instrumentation The textile industry requires a number of testing yarn and fabrics to ensure quality control. These instruments are mostly imported. SASMIRA has developed twelve instruments for testing various properties of yarn and fabrics

The textile testing instruments developed include Crockmeter, yarn examining machine, crip rigidity tester, crease recovery tester, crimp tester, pilling tester, stiffness tester, launderometer, perspirometer, hydrostatic dome tester, hydrostatic head tester and thermal conductivity apparatus.

The Invention Promotion Board has awarded a silver shield to SASMIRA for the indigenous development of perspirometer. ' National Research Developm Corporation of India has awar Certificate of Merit for the digenous development of stiffi tester.

Demand surveys have been un taken for synthetic fibres like ny filament yarn, polyester filam yarn, nylon staple fibre and polye staple fibre. Feasibility surveys the establishment of weaving processing units have also been dertaken. Special surveys v conducted on the potential dema for some specific man-made text Recently studies of common i rest to industry such as export tential of man-made fibre fab consumer preference for text etc have been done.

Technical Education

The need for a technical cadre the industry was felt even in early stages of starting the indu This was because the industry started on the basis of imported t nology, and for the continuanc the industry it was imperative the imported technology shoul assimilated and improved by indigenous technical talent. It necessary to have skilled wor and trained technical personne manage the various functions of industry. SASMIRA did pion ing work in this regard by s ing the Institute of Man-made ' tiles in 1961. This is the only I tute of its kind in the Asia im ing education in man-made te technology at various levels s ing from worker's trai and going up to post-grad studies.

The courses include certif courses in weaving, wet-proce and warp knitting of man-m textiles, as well as dyeing and fi ing of wool, diploma courses in tile technology and textile chemi as well as post-graduate cours management and marketing of r made textile. These courses recognised by the Board of Te cal Education, Maharas State.

The man-made textile indust concentrated in Punjab and besides Bombay. The industr these states need on-the-spot te cal and testing facilities. For purpose, SASMIRA is settin its Regional Centre at Am and Surat.

A demonstration plant for duction of synthetics fibres UNDP and West German h being set up. □

Shri Parikh is Director of the Silk & Art Silk Mills' Research Association, Bombay.

TEXTILE RESEARCH—3

Shaking Off Tradition

THE AHMEDABAD Textile Industry's Research Association, popularly known as ATIRA, was set up in 1949 as a cooperative research association jointly supported by the textile industry and the Government of India. The membership of ATIRA is voluntary and open to all companies engaged in textile manufacture and allied fields. The present membership is 152 units spread all over India consisting of textile mills, manufacturers of textile machinery, accessories, dyes and chemicals, and cooperative societies of cotton farmers and ginners

In the early stages of its growth, ATIRA had to strive hard to win Industry's acceptance The Indian textile industry had grown in an atmosphere of adherence to tradition and empirical thinking and methods. It was but natural for the managerial and technical staff to question the value of research. In this phase, ATIRA concentrated on implementing established research results obtained elsewhere and on introducing scientific concepts. For instance, it could be demonstrated that the high level of end breaks in ring spinning was due to poor maintenance of certain vital machine parts Appropriate remedial steps brought down the end breakage rate and boosted productivity. Similarly, a series of recommendations helped reduce the waste in carding and combing without impairing quality. The promotion of the concepts of quality control sharpened industry's awareness of the need for systematic data collection and analysis

The benefits of these recommendations were apparent to the member industry in a relatively short time. As a result, industry's acceptance of the role of research and receptivity to research recommendations grew rapidly.

Testing and Process Control

About 25 years ago, when the Indian textile industry was importing even the simplest of instruments needed for testing and process control, ATIRA launched a programme for the design and development of such instruments Over the years a total of 12 instruments have been developed India is today self-reliant in instruments needed for textile testing and process control. Given the socio-economic constraints operating in India, the textile industry, or for that matter any other industry, will have to remain broadly within the conventional technology and modify it for higher economy and quality. Some examples of this type of designing activity are : design changes in nonautomatic looms and ring spinning machines for higher productivity, improved mechanical yarn clearer to remove yarn faults and systems for recovering waste heat and for reducing consumption of power, fuel and water.

It has been possible to develop substitutes for various chemicals which are expensive, imported or not available in plenty For instance, a process has been developed to convert tamarind kernel powder into a form suitable for textile sizing This development has led to the replacement of starches from maize or tapioca which are edible materials, and also to an industrial outlet for an otherwise waste product, similarly, substitutes have been developed for sodium hydrosulphite, sodium alginate, citric acid and zinc acetate which are all expensive or imported chemicals widely used in dyeing and printing. Other dveelopments include new catalysts in printing and finishing which lead to saving in power consumption and higher productivity.

New Processes

The know-how for the durable press finish or polyester/cotton fabrics was developed a few years ago Apart from mills in India, Egypt has also purchased and utilised this know-how. A similar finish for all cotton fabrics and garments is ready for release and is expected to be of great use in promoting exports. Shorter methods for bleaching of polyester/cotton and all-cotton fabrics have been developed. These methods permit a reduction in the processing time and chemical costs and will be particularly suited to mills with modest volumes of production.

Methodology has been developed to use the computer in the formulation of recipes for dyeing with vat colours. This technique provides in a very short time the recipes to match a given shade and minimises the number of trial dyeings. Since the cost of the individual dyes is also taken into account, the recipe predicted by the computer often leads to a significant saving in dye costs as well.

The contribution of various processing parameters in spinning to yarn quality and processing performance has been studied in detail. It has been shown that insufficient separation of fibre clusters during carding is a major cause of thick place and slubs in the yarn. The causes of variation in yarn count and strength have similarly been identified The findings of applied research on the interrelationship between indices of yarn quality on the one hand and cotton, machinery condition and processing parameters on the other have been integrated into a practical system of process control The developments in spinning – high speed machines shorter processing sequences have been critically assessed through appropriate trials.

In the area of weaving, the problem of high warp breaks in weaving has received considerable attention The contribution of different type of yarn faults, yarn hairiness and inter-yarn abrasion during weaving has been isolated. Some of the remedial measures evolved are: the improved mechanical yarn cleare already referred to; after-waxing of sized yarns, staggering tappet for shedding, and modified ree design. Processing parameter have been optimised at the variou stages of preparing yarn for weaving The effect of critical factors on weaving performance and fabri appearance has been brought out As in the area of spinning, the information garnered in these studie has been employed to evolve a syster for process control.

Process optimisation studies hav been conducted for desiing, scouring and bleaching The importanc of maintaining strict control durin bleaching and scouring has bee highlighted.

Fuel economy has been an impo tant area of work all along-Sever measures have been evolved to r

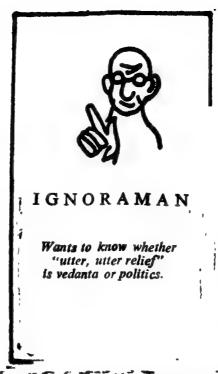
duce fuel consumption and to improve the efficiency of generation, distribution and utilisation of steam. Systems for recovery of waste heat have also been designed. In surveys of individual mills, the scope and value of these measures have been demonstrated.

Basic Studies

A limited amount of basic research is undertaken to support and supplement the programme of applied research and development discussed above. The areas of study are: structure and properties of cotton fibre and its physico-chemical modifications; structure and properties of starches, gums and other polysaccharides and their derivatives; and thermodynamics of reaction at the fibre/solution interfaces. The programme of basic research is largely handled by research scholars working for higher degrees. ATIRA has been recognised as a post-graduate institution by several Indian universities. Several of the instruments developed by ATIRA have also received awards from the Inventions Promotion Board and the National Research Development Corporation. The United Nations Development Programme (UNDP) has recently sponsored a project at ATIRA for the development of new chemical finishes for cotton

Consultancy and Technical Services

The most important aspect of consultancy provided by ATIRA is the operational survey of production departments from fibre to finished fabric. The operational surveys cover: examination of raw materials; processing sequences, parameters, and conditions; product quality; waste level; and labour and machine productivity. Wherever necessary, the raw materials, intermediates and finished products are tested in ATIRA's laboratories This factual information is utilised to identify areas and causes of sub standard performance and to suggest remedial measures. Depending on the wishes of the client, assistance is also extended for implementation of the recommendations. Annually, ATIRA handles 50 to 60 operational surveys. ATIRA offers consultancy in the area of modernisation as well.

Members also refer ad hoc problems to ATIRA. As a rule, these problems refer to specific product defects or processing difficulties. From plant observations and laboratory tests, the nature and probable


causes of the problems are identified and corrective steps recommended. On an average, 500 ad hoc problems per year are referred to ATIRA

Limited consultation is offered in the managerial areas also. Assistance is given to member mills in setting up modern information and control systems product costing, cost analsis, electronic data processings—as well as for establishing suitable procedures for personnel recruitment, training and appraisal

Inter-firm comparisons are periodically conducted on (a) productivity in spinning and weaving; (b) quality of yarns and fabrics; (c) production costs and financial performance and (d) consumption of accessories. Participation in these surveys ranges from 30 to 70 members. The information collected during such surveys is used to establish industrywide norms on different aspects of productivity, quality and profitability. Each participating unit receives an individual report which brings out its strength and weaknesses and indicates the necessary management action. These surveys are also a a valuable source of information for analysing the trends and shifts in the industry.

ATIRA's testing facilities are available to member mills for routine physical and chemical tests of fibres, yarns, fabrics, dyes and chemicals, water, coal and certain accessories and machine parts. Members can also avail themselves of sophisticated tests like electron microscopy, x-ray diffraction and infrared spectroscopy.

Training and Liaison

Several training programmes, each of two to five days duration are offered each year. On an average, about 250 middle line supervisors from the industry participate in the training programme every year.

Information on completed research projects is conveyed to industry in the form of research notes and technical leaflets. A quarterly technical digest keeps the member industry uptodate on current research projects. Group liaison meetings on selected topics are regularly conducted in which groups of mills in the vicinity participate. Annual liaison visits are paid by senior staff members to every outstation member. Seminars on subjects of topical interest are arranged periodically. Annual and theme oriented conferences are also held which attract about 500 participants.

The ATIRA laboratories and pilot plants are housed in a building with a total floor space of over 1,00,000 sq ft. The pilot plant has facilities for spinning, weaving and chemical finishing of cotton and man-made fibres. Two mechanical workshops and an electronics instrumentation laboratory cater to the research needs of development and fabrication and are also entrusted with maintenance of machinery and instruments The physical and chemical testing laboratories have all the modern instruments for testing fibres, yarns, fabrics, auxiliaries and chemicals A wide range of sophisticated instruments are also available for specialised research studies. The more important of these are; scanning electron microscope, IR, UV and visible light spectrophotometers, nuclear magnetic resonance spectrometer and gas and liquid chromatographs. The well-stocked library receives about 350 periodicals and has over 20,000 books and back volumes of journals The library also provides service on subject bibliography, documentation, translation and microfilms. Computer facilities are shared with an adjacent laboratory.

It has been conservatively estimated that because of acceptance of ATIRA's recommendations/ developments, the industry has been able to save approximately Rs. 20 crore over the last twenty years; the savings in foreign exchange are approximately six crore rupees. □

New Instruments

AMONG the achievements of the South India Textile Research Association (SITRA) has been a major breakthrough in the development of a chemical process for improving the wear life of cellulosics. It has been found possible, by this treatment, to increase the wear life of cellulosics by 200 per cent. Two new industries have been established on a commercial basis for the application of this process One has already started commercial production of SITRALISED spindle tapes while the production of treated industrial fabrics is in the pilot mill stage. Application of this principle for other end uses like fishing nets, various types of marine fabrics etc., is in progress. This development has been patented.

Award-winning Inventions

In the field of machinery design and instrumentation the two-for-one twister and hank-to-cone winder developed by SITRA recently deserve particular mention. Both have been licensed for commercial production These machines are already available in the market.

The two-for-one twister is the first commercial machine developed by a research organisation in the country. Its development has revolutionised the doubling technology to the same extent as the introduction of a ring frame has revolutionised the spinning technology. It has been found possible by introduction of this machine to increase production in doubling by as much as 250 per cent. This means for a spinning mill of 25,000 spindles, a saving of three to five lakh rupees a year. Similarly the introduction of hank-to-cone winder not only has benefitted the organised sector but will cater to the decentralised sector like powerlooms by making available a sophisticated winding machine with increased production and improved quality.

Other machinery items developed include super highdraft spinning, open-end spinning, reeling machine with stop motion etc. Some of these machines have also been exported. Two of these developments have won awards from Inventions Promotions Board.

A number of testing instruments which are commonly used in the textile industry have been developed from indigenous sources. The trash analyser, the fibre bundle strength tester, the automatic twist tester, the electronic spindle speed measuring device and the yarn speed meter deserve mention. Most of these instruments have now been licensed for commercial production. These have resulted in considerable savings in foreign exchange as these instruments were, till recently, imported.

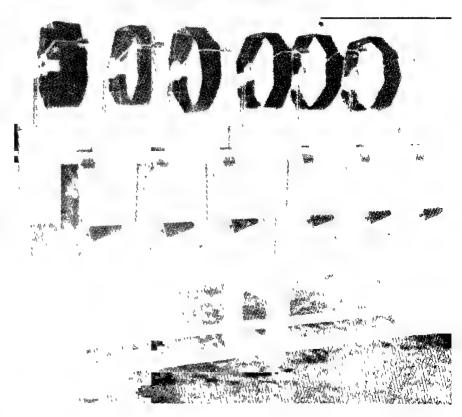
Product Development

In the field of product development also some significant achievements have been attained. The crease resistant raw silk fabrics is an example of work done in this field. To utilise the abundant quantity of raw silk available, SITRA has developed polyester silk blended fabrics. This material while retaining the quality and feel of natural silk has crease resistant and other easy care qualities of polyester fabrics. Besides increasing the scope for catering to sophisticated export markets, this will ensure the processing to a greater extent within the country of raw silk, now exported.

The polyester cotton-blended handloom sarees developed by SITRA is of considerable interest to the handloom industry in the country and makes it possible for them to produce traditional sarees of intricate designs having at the same time easy care qualities.

Fabrics produced out of unconventional fibres like ramie, jute waste, etc. are ideally suited for special end uses like curtain cloth, lamp shades, handbangs, and for the rural small scale industries

Hank-to-cone winder developed by SITRA has not only increased production but improved the quality of the fabrics.

sector.


Applied research activities of SITRA, besides process and product development, also cover studies relating to the upgrading of Indian cotton and its optimum utilisation as well as processing problems.

Work in the former area has revealed that it is possible to upgrade Indian cottons to spin even superfine counts, for which we were till now dependent on imported cotton, by removing 10 to 15 per cent of waste in combing This is significant from the point of view of better utilisation of existing raw material resources and savings in foreign exchange.

Some of the major studies in process development are: effect of processing variables on yarn quality, blending of synthetic fibre with cotton, combing performance, tendem carding, etc. These have not only contributed to improve yarn quality but also to increase he rate of production and improve working conditions of labour.

SITRA's studies on high production cards and ring frames, criteria for capital investment, development and replacement cost, have a special significance from the point of view of modernisation of the textile industry.

Cumulatively these studies have enabled processing parameters to be determined for yarn as well as fabrics manufacture Moreover machine factors which affect productivity have been identified. Higher speeds and shorter processes have also resulted. Taken as a whole the impact of work in this area will be impressive in that during the last two decades, the machine productivity in units which are members of SITRA has increased by 50 per cent and labour productivity by about 80 per cent. The benefit for the common man will be obvious when we realise that the cost of production of textiles has increased over the past decade by only 60 per cent as against the general increase in price of about 80 per cent. This will be even more significant when we take into consideration the fact that the cost of raw material which alone accounts for about 60 per cent of the cost of production, has gone up by over 200 per cent during this period

Operational Research

SITRA has developed a standard now commonly used for the measurement of productivity. The study of idle machine capacity done by SITRA and suggestions given have led to an average increase of 40 per cent in machine utilisation during the past 10 years. The machine utilisation in SITRA member mills is one of the highest in the world, about 80 per cent mills working seven days a week and 50 per cent of the mills round the clock

The systematic study in the field of waste reduction has resulted in a saving in cotton of 1 to 1 5 per cent in carding and 2 to 3 per cent in combing in many member mills For SIRTA member mills alone this means overcoming cotton shortage to the extent of about 25,000 bales a year

Consultation services form a significant part of the activities of SITRA Diagnostic surveys, techno-economic surveys, quality and cost controls, testing, selection and placement form major areas of activities in this field. These have enabled the industry to pinpoint the area of weakness in mills and to determine the degree of assistance necessary to overcome them. These also help industry in rapid modernisation and improvement Consultancy services, rendered in the solution of short term problems during the period of recession, have enabled the mills to overcome losses to a substantial extent, without incurring any major expenditure. The services rendered by SITRA to the public sector units in the industry have enabled them to organise on a scientific basis. The State and the Central governments and various financial institutions have been utilising these services for determining the degree and extent of assistance necessary for the industry

Two-for-one Twister, the first commercial mahine developed by a research organisation

Help to Handlooms

A study is now in progress for examining the scope for increasing productivity, reducing costs and improving quality in the handloom sector. The study also covers the scope for use in handlooms of sophisticated yarn.

There is considerable scope for diversifying production in the knitting industry Work in this area was launched with UNDP help, and the first phase of the programme came to a close recently Various types of products having good demand both within the country and abroad and which could be easily manufactured by the existing machinery have been identified For the industry to produce garments of acceptable standards, it has to modernise by application of latest scientific techniques and by controlling quality Operational research support in this area is being extended by SITRA in stages.

Basic research by SITRA cover fibre structure by X-ray diffraction studies, Frictional forces in cotton and regenerated cellulose fibres, taper of cotton fibre, effect of swelling agents on dimensional characteristics of fibres and yarns, irregularity of blended fibre assembly in ring and open-end spinning, tensile behaviour of yarn, factors affecting yarn irregularity, effect of atmospheric conditions on yarn quality, yarn hairiness, pilling in polyester cotton blended fabrics.

The membership of SITRA has increased four fold in the past two decades. □

Import Substitution

T. V. Ananthan

THE BOMBAY Textile Research Association (BTRA) was registeed in 1954 with a membership of 26 mill companies. In 1961 the pilot plant and laboratories were set up. BTRA'S membership is now 87 including an overseas member.

From the very beginning, the limited resources of BTRA have been deployed in areas where maximum benefits accrue to the largest sections of the member-industry, and the results of researches have been rapidly translated into fullscale processes *on the mill-floor* so as to bring about the 'pay-off' in minimum time. The tangible achievements cover gains through optimisation of processes, import substitution new processes and products, machinery research and instrument development, basic research and sponsored projects.

Researches in spinning have led to up-grading of cotton mixings, reduction in card and comber wastes, lowering of end-breakage rates, and substantial improvement in yarn quality and spindle productivity. Intensive maintenance audit has helped the mills reduce the proportion of idle spindles by 40 per cent and consumption of lubricants by 10 to 20 per cent. Similarly, studies in weaving have enabled saving in sizing materials, better control of stretch and migration of ends, and an overall improve ment in weaving productivity, with reduced defectives as bonus. In chemical processing, otpimisation ofkier boiling, mercerizing and bleaching have provided means for re-use of kier liquor, caustic soda recovery, re-use of water, and savings in fuel and steam utilisation. Mills could reduce water consumption by 20 per cent and fuel by six per cent. The norms established through operations studies cover productivity, wastes, manpower and inventory and follow-up action at unit level has resulted in savings in card waste, comber waste, hard waste and total labour employment.

BTRA processes for the partial substitution of sodium hydrosulphite in vat dyeing and complete substitution of rongalite in printing have received NRDC awards. These processes have been realised, at Government's request, for the benefit of the decentralised sector.

BTRA's novel electrolytic process for vat dyeing has won several awards, including the second highest Republic Day award for meritorious invention (1975). They have good export potential. A demostration unit has been recently set up in West Germany.

On a more modest scale, work done on indigenous wood for shuttles, *substitution of mutton tallow* with mowrah fat and instrument development, have also contributed to import substitution.

Among the new processes and products developed by BTRA to bring economies in processing or enhance the value of textiles through new styles and effects are singlestage process for bleaching of cotton fabrics in kier, singlestage process in jig for polyester cotton blends, rapid bleach process for cotton on paid-roll system, mono-step sizing-cum-dyeing for denims, process for substitution of conventional resisting agents in reactive and naphtol dyed gounds, fast acting catalyst system for pigment printing, saving in power consumption or increased production, additives for effective carbonisation of polyester sarees, blend finish for cotton, permament soft finish to cotton and polyester textiles, techniques for printing broken effects' on textiles and for polychromatic printing, chameleon and transparent prints fancy print for polyester and 30 print on nylon, 'dual-feel' for organdie fabrics and a low-cost oil stain remover.

Among developments in machinery and instruments are, gravity traps for the blowroom, fibre retriever for cards, stop-motion for reeling machines and for doubling and twisting frames, electrode systems for the novel electrolytic process, ring ovality tester, traveller stretch tester and gear run out tester, flyer balancing stand, automatic scrap reel, direct yarn count blance and spindle topping apparatus.

BTRA has successfully completed two PL-480 projects, namely, one on curling and bursting of selvedges and another on 'grafting co-monomers on to cotton'. third project on the effect of p finising preparatory processes strength retention of durable pr finished fabrics is under progres

More recently, the Ministry Commerce has approved two p ject proposals of BTRA realat to the development of durable flar retardant finishes for cotton a synthetic blend fabrics, and the duction of oil-stained damages textile by solvent scoring

BTRA is recognised as a cen for post-graduate research by Bo bay University, and member m have been coming forward w sponsored projects and fello ships.

From time to time, BTRA h rendered assistance to the Defe Establishment in product develc ment and standardisation; f example the combat wear life army drill was doubled by develc ing a construction containing per cent nylon-420 in the wa a durable water repellent finish f cotton was synthesized from digenous raw materials and sta dardised.

Similarly, the decentralised sec received the benefits of the BTF processes for partial substitution sodium hydrosulphite and compl substitution of rongalite. T Khadi and Village Industries Co mission also receives help a guidance in evaluation of improv spinning units and textiles.

Reference Literature

The surveys, shopfloor studies a research work done in the course years have enabled BTRA to provi the industry with standard and re rence literature for evaluation a improvement of day-to-day wor ing. More recently, the problem transition into a multi-fibre indus has come to the fore, and BTF has been assisting the industry a whole through timely publicatio

Industrial research is to be view purely as a commercial operatic and is to be judged from the retur it tides to the sponsoring indus Though qualification of benefits a difficult task, an attempt is ma to express the gains in moneta terms, taking only some of the i portant research contributio In relation to the total expendit incurred, it has been found that t cost-benefit ratio is 1 : 19, which a testimony to the successful wor ing of the cooperative research co cept for the benefit of the indus as a whole □

Shri Ananthan is Director, Bombay. Textile Research Association

Work At Calcutta

THE INDIAN Intitute of Experimental Medicine, Calcutta seeks solution of medical problems yet unsolved, through research in the basic biological sciences, emphasis being placed on the current biological and medical needs of the country. The Institute, originally established as an unofficial medical research institution by nationalist scientists in 1935 came under the CSIR in April 1956. During its first decade under the CSIR the Institute made significant contributions to cholera research; the bacteriophage typing technique it developed for the epidemiological study of cholera and its work on oral vaccine won international recognition for the Institute's scientific work.

During the last ten years the Institute's research programme has placed increasing emphasis on work of applied or industrial value. As a result of this reorientation of its work, the Institute has completed the development of three processes of industrial utility namely, preparation of acid protease for use as a leather bate, fractionation of plasma proteins at room temperature and preparation of gelatin optical filters. These processes have been assigned to the NRDC for release for commercial exploitation and the process for gelatin optical filters has already been released to an industrial concern.

Steroid Drug Industry

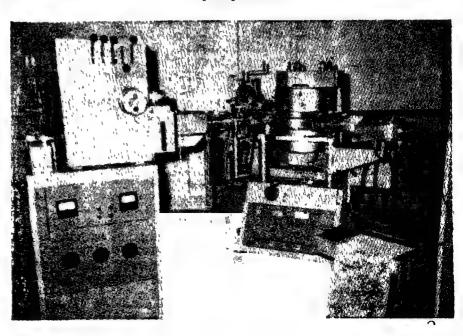
Work done during the last two years has led to a significant contribution of immediate value to the steroid drug industry. Diosgenin constitutes the staple intermediate on which the Indian steroid industry is based, and practically the entire output of diosgenin in India, is produced from wild *dioscorea deltoidea.* Newer and simpler sources of diosgenin are required to help the Indian steroid industry grow. The Institute has now identified the exotic weed *Kallstroemia pubescens* (G. Don) growing in the eastern region as a good source of diosgenin. The ease of cultivation, collection and processing compensates for its somewhat lower diosgenin content, and makes it a useful commercial source of diosgenin.

Synthesis of quebrachamine and rhazidine by a newroute has been achieved in the medicinal chemistry division. The neuropharmacological studies on quebrachamine and rhazidine are being carried out for its profound sympathomimetic activity. The important observation was that quebrachamine in addition to its central stimulatory property also affected the liver microsomal enzymes through indirect mechanism.

Among other investigations that have yielded significant results may be mentioned the work on a single strain vaccine for mass prophylaxis against both cholera and typhoid. The vaccine is based on a recombinant strain of *Salmonella typti* and *Vibrio cholerae*. Three transformant lines have been selected for study as vaccine strains. The transformants did not appear to have lost any of the original *S. typhi* antigens, and have been shown to evoke satisfactory antibody responses in rabbits In the course of this work a new mechanism mediating the transfer of genetic information among bacteria has been brought to light. This gene transfer process, whicl has been designated 'transplasmidisation' because it is mediated by the extra- chromosomal geneti elements, plasmids, appears t constitute the most prevalent systen of gene transfer among bacteria It has also been possible to transfe DNA from rabbit to an *E. col* strain, and to show that the trans formant is able to transfer th characters encoded in the DNA t the original wild-type recipients i series.

The Institute's work in the ar of reproductive biology is concentrated on a search for anti-fertility agents, particularly anti-implantation agents among Indian medicina plants. A compound extracted fron *Aristolochia indica* has been founc to possess potent abortifacient activity when fed to female mice on days 1-6 of pregnancy. Another extrac from the plant exhibited inhibitory activity on male gonadal functions.

Systematic investigations carriec out during the last few years or Parkinson's disease employing th 'oxotremorine model' of the dis ease in experimental animals hav yielded important new knowledge on the origin of tremor and other motor disorders associated with the disease Spinal motor mechanisms of contro and both the extrafusal and intrafusal skeletal neuromuscular transmission processes at peripheral leve have been shown to contribute to the genesis of Parkinson-like moto disturbances. These findings provided a new therapeutic approach to Parkinson's disease in particular. A number of new anti-Parkinson drug

Mass spectiophotometer


have already been identified on the basis of their effects at the peripheral myoneural apparatus

The Institute has been engaged in a programme of collaborative research on toxaemia of pregnancy with the Department of Gynaecology and Obstetrics of the Medical College, Calcutta. Findings of special scientific interest bearing on the aetiopathology of eclampsia resulting from this work are that serum and placental levels of monoamine oxidase are considerably lowered in eclamptic subjects and plasma fibrinogen is considerably raised. A definite rise in fibrinogen level and prolongation of clot lysis time were observed also in cases of abortion induced by hypertonic saline. It appears that sodium may have a common role in producing a hypercoagulable state both in toxaemias and induced abortions.

Studies on various hormones such as erythropoietin on its role in the metabolism – have been extensively done. Some of the inferences obtained show a specific role of this hormone in the metabolism such as in the processes involved in iodination in thyroxine biosynthesis

The Biophysics group is actively engaged in elucidating the mechanism of action of the drug furazolidone. Significant contribution has been made by finding out the interaction of furazolidone with DNA. Interesting development in this regard, is that furazolidone has significant photobiological activity which will be of help in future therapeutic use of this drug

One of the important aspects of neurobiology is the studies on biogenic amines. This Institute has made a significant contribution on the metabolism of monoamines. Some of the investigations show that there are two mechanisms through which these monomamines are oxidised. This is important because MAO inhibitors are used in mental diseases.

Research Projects

The Institute's research programme presently comprises 20 projects taken up on the basis of their relevance to the country's health problems and important medical and biological needs. Among these the projects assigned priority are (1) development of a single strain vaccine for cholera and typhoid (2) conversion of psychotrine to dehydroemetine and chemical modification of the structure for better activity (3) bulk isolation of glucagon from slaughter house waste and its regulatory role in carbohydrate metabolism (4) development of a fermentative method for the large scale production of methionine and (5) Biochemical Engineering : preparation of biochemicals from hospital wastes and agricultural products. Three of the Institute's extent projects fungal acid protcase, follow-up chemical investigation of Indian medicinal plants identified in the screening programme of CDRI and RRL, Jammu, and the experimental cultivation of Dioscorea yams of higher diosgenin content— were taken up under the auspices of the Co-ordination Council for the Biological Sciences Group of National Laboratories.

Reorientation of Programmes

During the past nine months much thought has been given to the reorientation of the Institute's research programme designed to achieve a threefold objective namely (a) producing an immediate impact on national programmes for the promotion of national health and rural welfare (b) concenoentrating the resources of scientific expertise available in the Institute on two or three multi-disciplinary projects with which most of the Institute's senior scientists could be associated and (c) ensuring that the Institute maintains a high standard of scientific excellence in its area of activity. The last mentioned objective implies also the need for encouraging collaborative work with University departments, research institutions and hospitals of established reputation, so that the Institute's scientists maintain rapport with the mainstream of scientific thought and progress in the country.

Accordingly a new project on enzyme engineering has already been started with finiancial support from the Department of Science and Technology. Four aspects are proposed to be investigated (a) Development of diagnostic aids based on the use of immobilized enzymes, e.g. glucose a oxidase stripes and immobilized ureas for the estimation of urea. In view of the simplicity of the technique it is ideally suited for use in rural health centres, and in urban areas will rednce the cost of diagnostic services. (b) Development of drug and enzyme delivery systems based on the use of liposomes incorporating glycolipids or antibody to cell-specific antigens on their surface so as to target them to particular cells which are diseased. Experiments already carried out in respect of liver cells support the feasibility of this approach. Such systems of drug delivery will help to improve the therapy of diseases like viral hepatitis and cancer, and also lower the cost of treatment of diseases for which satisfactory therapy is presently avaiable (c) Enzyme-linked immunoassay system for rapid diagnosis. This systeem would employ enzyme-labelled antibodies (in matrixbound form) to detect circulating soluble antigens and antibodies for the diagnosis of parasitic diseases like malaria, and filariasis, whose diagnosis present involves laborious procedures Similar systems are proposed to be deoloped for the detection of drugs and toxic substances also. (d) Development of single shot vaccine. In initial experiment it has been observed that injection of the enzyme invertase in free form does not cause antibody formation The research planned under the project on enzyme engineering brings together a number of disciplines already developed in the Institute, such as biochemistry, biophysics, chemistry, microbiology immunology, and pharmacology Collaboration is also envisaged with a number of outside research institutions like the Division of Biology and Medicine, BARC, Christian Medical College, Vellore and the Indian Institute of Science, Bangalore.

Therapeutic use

The work under the project on biochemical engieering has been formulated anew, again with the objectives stated earlier in view In the first phase of development of a laboratory in biochemical engineering, its work will relate to the development of R & D for the preparation of biochemicals required for biomedical research, and for diagnostic and therapeutic use, ultilizing expertise already available in the Institute. At present a number of biochemicals required for research (e.g. hyaluronic acid, N-acetyl neuraminic acid, concanavalin A, sepharose – concanavalin A, *Ricinus communis* lectin etc. are being marketed in the developed countries at exorbitant prices because of the high cost of raw materials and labour. The Institute proposes to take up the preparationof a number of biochemicals for which methodology has already been developed and develop methodology for selected products of research or therapeutic importance like neuraminidase, cholera enterotoxin, plasmin, HCG, placental enzymes,

asparaginase etc. The raw materials to be utilized will be mainly hos- wastes like umbilical cord, placenta agricultural products like *Canavalia ensiformis* and *Ricinus communis* and slaughter house wastes like pig blood. The programme has among its important aims the creation of self employment opportunities for fresh science graduates by training them in the utilisation of cheap wastes and natural materials for the preparation of biochemicals for the internal as as well as export markets. It is proposed that the products may be marketed through the CSIR Biochemicals Unit.

Another project that has been similarly reoriented and extended in scope relates to the study of mental retardation caused by inborn metabolic defects in the eastern part of the country. The aim is to study the pattern of incidence of genetically mediated mental retardation in this area, develop techniques of rapid diagnosis applicable to patients as well as at the prenatal stage and develop advisory health case service to help retarded children and also provide genetic counselling to expectant mothers whose offsrping may be at risk. The study covers genetic defects of amino acid, lipid and carbohydrate metabolism; on the clinical side the Bangur Institute of Neurology and the Departments of Pathology and Paediatrics of the Institute of Post Graduate Medical Education and Research, Calcutta are collaborating in the programme and on the investigative side, the Biochemistry Department of the IPGMER and two groups from the IIEM.

It is clear from recent trends that membrane structure and function will play a major role in the understanding of the processes involved in various diseases. Understanding of the membrane properties will lead to the development of newer drug delivery systems. In this one important work will be development of a programme on the chemistry of carbohydrates.

It is needless to add that the development of these programmes have to be synchronised with the development of various basic programmes: microbial genetics — to isolate enzymes for therapeutic purposes, biophysics — for physicochemical properties of membrane and interaction of macromoles, development of basic programmes particularly for carbohydrate chemistry. Isolation and identification of natural products of therapeutic importance with reference to drug delivery system, development of experimental pharmacology for assessment of various aspects of drug delivery system needs to be strengthened to cope up with the development in the applied aspects.

Research Utilisation

One of the problems facing an Institute like this is the utilisation of the results of research. In case the clinician has to corroborate the results of our experiments conducted on animals. The industrialist has to exploit the processes we develop. We have therefore to maintain rapport with the clinician as well as with the industry in order that our results may find meaningful application.

Multidisciplinary biomedical research is progressing at such a fast rate, that it is not possible for one organisation to collect all relevant information on the different disciplines. As such we have been feeling the need for proper collaboration with other medical and research institutions we can not only supplement the range of expertise required for our work and also for a central organisation that could satisfy our needs for up-to-the minute information on the variegated facets of our research work. □

standing up to the acid test...
of time

Prevention and Cure

THE CENTRAL Drug Research Institute, Lucknow, the seventh in the chain of national laboratories under the Council of Scientific and Industrial Research, was set up in 1951. The Institute helps the pharmaceutical industry and research institutions in the form of technical consultancy, dissemination of information on drug research and production and training of research workers in the disciplines concerned with drug research and in modern instrumentation techniques. Its research divisions comprise medicinal chemistry, biochemistry, biophysics, endocrinology, pharmacology including clinical pharmacology microbiology, parasitology, virology, experimental medicine and toxicology, biopharmaceutics, fermentation technology and process development.

Appropriate infra-structural facilities have been built up to provide the necessary logistic support to R & D. The specialised library has a stock of over 26,000 bound volumes of books and journals and subscribes to 476 Indian and foreign journals. This and the attached patents inspection centre constitute the nucleus of the information centre for drugs and pharmaceuticals. A modern animal house with breeding facilities stocks over 25,000 laboratory animals belonging to over a dozen species, both native and exotic, and includes a primate colony. The regional sophisticated instruments centre partly supported by the Department of Science and Technology, has facilities for physicochemical measurements like mass and nmr spectroscopy, elemental analysis, polarimetry, gas-liquid chromatography, atomic absorption spectrometry, radio-isotope counting and electron microscopy. The Biometry and Statistics Unit provides statistical analysis of data and helps in design of experiments. An industrial liaison group maintains close collaboration with the pharmaceutical industry and R & D organisations.

Other ancillary services are a workshop, instrument repair and maintenance section, glass blowing and photography.

The number of research scientists is about 175, supported by an adequate complement of technical personnel; the total staff is about 800. The Institute is supported mainly by the CSIR. The total budget for 1976-77 was Rs. 130 lakh.

Development of technology for translation to industrial production comes under the areas of (i) process development, and (ii) fermentation technology

The new drug development programme is particularly oriented to the discovery of better drugs and immunoprophylactics for tropical diseases in the areas of amoebiasis, parasitic infections like filariasis, malaria and helminth, and cholera. Other disease areas of interest are viral infections, cancer, disorders of the cardiovascular and nervous systems, and carbohydrate and lipid metabolism disorders.

Control of fertility is an important area; a multipronged approach is being followed which includes development of post-coital pills, local contraceptive devices, contraceptives for the male and tubal and vasal occluding agents

Investigation of medicinal plants and herbal remedies reputed in Ayurvedic and Unani medicine with a view to incorporating effective drugs into modern therapeutics is another long-term project. Survey of marine flora and fauna as a source of biologically active compounds is an extension of these studies

In each of these areas, besides the applied projects, there is a component of oriented basic studies which are essential for providing leads for applied work.

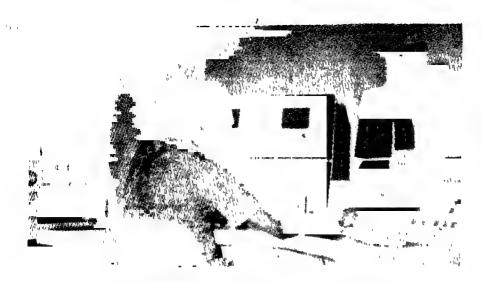
Process know-how for about 6 processes have been passed on to various firms for commercialisatiom. These include synthetic drugs like indomethacin, amitryptiline, destropropoxyphene, thiacetazone, paracetomol, dapsone, dexamphetamine, methylamphetamine, lidocaine; drug intermediates like dimethylbenzimidazole and levulinic acid; biologicals like peptone and pepsin; and fermentation chemicals like l-ephedrine, polymyxin; and plant products like l-dopa and psoralen.

The Institute acts as technical consultant to some public and private sector firms. Based on a project report prepared by the Institute, the U.P. government and the Indian Drugs and Pharmaceuticals Ltd. are jointly setting up a pharmaceutical manufacturing unit in the public sector. Project reports submitted by entrepreneurs to financing organisations are examined for their technical feasibility.

A new antithyroid drug has been developed which is useful in the treatment of hyperthyroidism and has some advantage over the presently used drug; it is expected to be marketed shortly. A new local anaesthetic agent is in the final stages of clinical trial at a number of medical colleges and hospitals. An anti-anxiety agent is also undergoing multi-centric clinical trials. Other potential drugs under clinical trial are: an anti-tapeworm agent which is better than currently used ones in that it kills and expels the whole worm, thus preventing reinfection; an anti-filarial which is more potent than diethylcarbamazine, the drug now in use; a hypotensive; an anti-depressant; and a neuroleptic.

A post-coital contraceptive having minimal side effects is undergoing extensive trials under the auspices of the Indian Council of Medical Research It is a nonsteriodal compound and is being tried both as a single dose post-coital pill and as a pro-phylactic given once a week. The results obtained till now indicate good protection against pregnancy.

The saponins of *sapindus mukorossi* (soapnut, "ritha") have been found to have spermicidal property; they have been used in making a contraceptive cream for intravaginal application. This cream is much cheaper than those based on imported ingredients. An imported device known as laminaria tent is required for dilating the cervix for medical termination of pregnancy, a cheap and efficient cervical dialator has been develoed using the husk of *plantago ovata* ("isabgol"). an indigenous plant; in preliminary trials the device has shown encouraging results.

Over 2,100 medicinal plants and a number of Ayurvedic and Unani remedies have been evaluated in order to verify their claims; about 100 plants or remedies have shown biological activity in preliminary tests, particularly anticancer activity, and these are under detailed study. Two promising products have


Electron Microscope - A modern tool in biochemical research

reached the stage of clinical trial· these are a cholesterol-reducing agent from the resin of "guggul" (*commiphora mukul*) and an anti-inflammatory agent, curcumin, from "haldi" (curcuma longa) A cardiotonic, asclepin, from *asclepia curassavica* is also under investiga-

A major problem in control of filariasis is the difficulty of quick and early diagnosis. A simple and rapid immuno-diagnostic skin test has been developed using an antigen made from the human filarial para site, *berugia malayi*, the test is specific and useful for diagnosis at a very early stage, thus facilitating treatment.

Since the clinical dose of the antifilarial drug, diethylcarbamazine, is associated with adverse side-effects, prolonged administration of a low sub-clinical dose was tried and found to eliminate or bring down the number of circulating mixrofilariae in the blood of patients to a level too low for further transmission through mosquitoes. It has been suggested that regular use of common salt containing 0.2 per cent of the drug with the food, for 11 weeks, by the population in endemic acreas could be a suitable method for chemoprophylaxis and control of filariasis.

Based on the observation that a single injection of cadmium chloride solution can destroy the ovaries without causing any other damage, and thus cause sterilisation, an instrument has been designed for intraovarian injection which provides a rapid, simple and inexpensive method for sterilizing useless scrub cows.

Basic studies

Studies on physiology of reproduction are oriented towards elucidating the nature of the biochemical milieu of the fallopian tube and uterus, regional differences in the physiology of the tube and its role in ovum transport and the effect of hormones on biochemical events preceding and following implantation. Considerable work has been done on the mode of action of currently used contraceptives and the IUD. The latter appears to produce changes in the biochemical parameters of the uterine fluid which becomes hostile to the pre-implantation blastocyst A number of antispermatogenic agents appear to act primarily by interfering with the energy producing system and secondarily with protein synthesis and steroidogenesis in the testicular fluid and seminiferous tubules Long-term studies in rats and dogs on the effect of vasectomy revealed the absence of any untoward effects on gametogenic and endocrine function of testis

Amoebiasis is a major health problem of the tropics. Emphasis has been on understanding the phenomena of excystment and encystment of amoebae and virulence of *E. histolytica*. Aqueous extracts of several bacteria and fungi particularly *E Coli* and *aerobacter aerogenes*,and of certain amino acids were found to promote excystment of *schizopyrenus russelli* and *hartmannella culbertsoni*. Thrity two bacteria were found to induce enxcystation of *'entamoeba invadens* and *E. moshkovskii* under anerobic conditions. Some evidence has been obtained that cyclic AMP triggers the process of encystment in *H. culbertsoni*. It has been shown that a low negative redox potential is very important for axenic growth and that a low concentration of L-cysteine hydrochloride produces a stable negative potential. Cholesterol has been implicated as one of the factors inducing virulence. Strains from human "carriers" originally a virulen to rats could be made as virulent as strains from human acute cases by feeding amoebae with cholesterol in culture and this virulence could be maintained by passage through rat caecum. A system of classification of amoebae has been developed based on nuclear division and other stable characters and possible phylogenetic relationships Some light has been thrown on the epidemiology of *naegleria aerobia* infection which causes fatal human meningoencephalitis.

The novel observation that the Indian jungle crow harbours a natural filarial infection, which has been named *chandlerella hawkingii*, provided a model for studies on microfilarial periodicity and immunity. The migration of microfilariae to and from the lungs in jungle crow was found to be due to alterations in the body temperature of the host and the concentration of carbon dioxide in the inhaled air.

Viral Diseases

In the field of virus diseases attention is focussed on interferons as these cellular proteins are implicated in the defence mechanisms of humans and animals. Ranikhet disease virus, live or irradiated with *uv* light, could induce formation of high titre interferon in mice, rats, fowls, humans and cell cultures. An interesting observation was that induction of interferon by RDV in tumour-bearing rats resulted in an increased lag phase of WM 256 tumour growth. Chick interferon has been found to inhibit endo and exo-toxin formation in cultures of *sal. typhimurium* and *clostridium welchii* respectively without altering their biochemical properties which would suggest that microbial pathogenicity is from virus-like factors

In the area of central nervous system and cardiovascular disorders, considerable work has been done on the synthesis and pharmacological evaluation of a diverse variety of heterocyclic structures This study has enlarged our understanding of structure-activity relationships and of the nature of receptors involved. Basic studies have been carried out on the elucidation of neural mechanisms and central and peripheral regulation of cardiovascular activity. It has been shown that adrenergic influences have an excitatory effect on central cardiovascular loci. Dopaminergic mechanisms have been found to be involved in apomorphine-induced

stereotype in guinea pigs but not in pigeons. Dopamine also appears to play an important role in the analgesic effect of morphine.

The effect of Mg^{++} on heart has been studied and it has been shown that there is significant reduction in ECG voltage in animals kept on a Mg deficient diet and this could be correlated with disruption of oxidative phosphorylation in myocardial mitochondria. *In vitro* studies suggest a direct effect of Mg^{++} on contractibility of cardiac muscle independent of Ca^{++}. High Mg^{++} level was shown to inhibit acetylcholine release.

Understanding the pathogenesis of atherosclerosis and its relation to hypertension is important for the study of disorders of lipid metabolism. The significant role of catecholamines in experimental atherosclerosis has been shown.

Future Programmes and Perspectives

The present objectives of the Institute, namely the development of new therapeutic agents for commonly prevalent diseases,providing aid to the pharmaceutical industry by development of technology, and better utilisation of indigenous plant resources will continue to be the major areas of thrust. For treatment of tropical diseases and regulation of fertility, an immunological approach will be more practicable in our country for logistic reasons. Efforts are being made to establish immunology as a discipline for development of immuno-prophylactic and diagnostic agents.

The recurrence of malaria has necessitated initiation of work on its chemotherapy, chemoprophylaxis and immunoprophylaxis.

Presently used cholera vaccines do not provide satisfactory immunity. The work on development of a better vaccine using hybrid strains of cholera vibrios produced by application of modern genetic techniques has been strengthened.

In view of the extensive use of indigenous remedies particularly in rural areas and by the lower income groups and the need for providing medical relief at low cost, the work on medicinal plants will continue In addition, evaluation of the efficacy and safety of Ayurvedic and Unani drugs, in the form in which they are used in these systems, will be carried out according to acceptable scientific criteria.

The role of chance discoveries in development of new drugs is being replaced by a greater degree of rational planning in design of potential drug molecules. The extent of success of this approach is connected with an understanding of pathological processes at the molecular level and more precise information about the nature od drug-receptor interactions. Basic research to understand the biocmistry and pathology of the disease trocess as also the study of quantiative structure-activity relationship are, therefore, becoming more and more relevant and stress is, therefore, necessary on such studies.

Biological screening models will have to be improved and during coming years suitable *in vitro* techniques will have to be developed, including cell culture lines, to enable more rapid screening. Suitable animal models for several disorders where such test systems are not available have to be developed.

Development of long-acting drugs would greatly reduce the frequency of administration and thus help in improving the effectiveness of prophylactic and curative health programmes. Attention will be given to delivery systems which would increase the half-life of drugs and also direct them to specific sites in the body where they are required.

Microbiological techniques for modifying the structures of compounds offer scope for obtaining useful drugs or other chemicals and greater stress would be given to basic work in applied microbiology. ☐

National Physical Laboratory

A.R. VERMA

NATIONAL PHYSICAL Laboratory is one of the first laboratories set up by the SIR. During the last decade sufficient emphasis was laid on applied search and development projects. stead of selecting short term pro- its, the research programme of e laboratory entails development of new technologies keeping view the futuristic needs of the untry. However, short term pro- its sponsored by the industry are dertaken. Know-how has been veloped and released for more an 70 new products/processes to e industries for indigenous pro- ction Production worth Rupees o crores is carried out annually the NPL licencees.

The main objectives of the Labotory are :

1. Custody, development and maintenance of the national standards of measurement at internationally accepted accuracy, and research on standards and on new techniques of measurement;
2. Periodic calibration of standards of measuring instruments and equipment used by various Government and other testing authorities, industries, defence, against national standards, and supply of standards to various agencies;
3. Calibration of instruments and testing of industrial products and appliances for performance, life and for effect of environmental conditions;
4. Maintenance of library of standard reference materials including characterisation of materials for purity, perfection and physical properties,
5. To undertake applied research, design and development work in physics oriented technologies with a view to improve, adapt, and develop indigenous and imported tecnologies. These areas include solid state and electronic materials such as semiconducting, magnetic, peizoelectric, ferroelectric, electron-optical and luminescent types and their devices; microwave components, circuits, sub-systems and instruments; thin and thick films; reprographic, display, control & measuring instruments; cryogenics and super-conductivity; vacuum technology; high pressure technology; carbon technology; and glass equipments and apparatus.
   To undertake work on systems planning and performance on special national efforts falling within the scope of the laboratory.
6. To undertake basic research in standards, radio science and in areas of applied research and development indicated in 5 above and in emerging areas of physics.
7. Technical advisory services, information, extension, consultancy and training, and collaboration with universities and other organisations.

Standards of Physical Measurement

NPL is the custodian of the National Standards of physical measurement for base units such as of mass, length and time, as well as derived standards for force pressure, etc Sustained efforts are made to improve the accuracy of the existing standards, and to evolve new ones. The laboratory has initiated research programme to establish national standards of measurement in terms of quantum phenomena with a view to keeping pace with the international trend. Efforts are being made to set up the standards of length measurement in terms of the wavelength of light radiation emitted by krypton-86 and stabilized helium neon gas laser and to set up voltage standard using Josephson effect. Stabilised He-Ne lasers have been developed for this purpose Cesium beam standard has been set up to improve the accuracy of time and frequency standard from 1 in 10^{8} to 1 in 10^{11}. An interchangeable pan balance of 1 kg, sensitive to measure mass to an accuracy of 0.05 mg has been designed with the ultimate aim of acquiring the highest accuracy – a few parts in 10^{9}. Work is in progress to improve the accuracy of these standards further.

The laboratory has set up stan-

r Verma is Director, NPL, New elhi.

ards for derived units, such as radiometric standards, spectroradiometric standard, of voltage standard, microwave power and impedance standards, and vaccum standard. An ultra-high vacuum set up to record a vacuum of the order of 10⁻⁹ torr has been established and efforts are being made to assemble a unit which may record vacuum upto 10^{-11} torr.

New Programme

Laboratory has drawn up a ten-year programme for establishing and maintaining standards for various electronic parameters covering all frequency ranges from DC to microwaves Force standard is being set up to calibrate force measuring instruments upto 1 MN (100 tonnes dead weight machine).

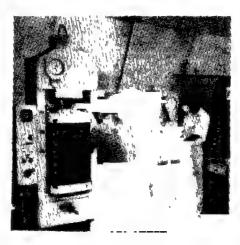
Calibration and testing of industrial products, instruments and prototypes according to the IS specifications as well as other specifications is a continuing activity of NPL. Voltmeters, ammeters, wattmeters, insulation testers, resistance bridges, klystron power supply attenuators and frequency meters and vacuum gauges are calibrated Testing of products like fuse units ballasts, air-break switches, voltage stabilizers, motors, cables, ceiling fans, plastic materials, conduit pipes, helmets, power cables and microwave components is undertaken. More than 2500 test reports were issued

Sophisticated methods like X-ray spectroscopy and diffractometry, electron microscopy, Mossbauer spectroscopy, long topography, EPR ESR, and atomic absorption spectrometry are employed to investigate the materials and the nature of impurities. The laboratory provides such facilities to industries and research organisations for the development of newer materials used in electronic devices. It is proposed to set up a library of standard reference materials.

The laboratory also undertakes the design and development of test equipment to test specific products according to IS and other specifications Consultancy services are rendered to set up quality control labs. in the industries.

Problems arising out of the rapid advancement of the electronics industry receive the attention of the laboratory. A Test, Evaluation & Calibration Centre to undertake environmental and life tests on electronic and electrical components and systems has been set up.

The performance of various components, equipment and systems is based essentially on the quality of the materials used for their manufacture. NPL has made considerable efforts to develop new materials like Nickel-Zinc ferrites, low frequency ferrites, square loop ferrites, Manganese-Zinc ferrites, dielectric and piezoelectirc materials, semi-conductor-grade silicon, phosphors, high-value composition resistors, thermoelectric materials, conducting silver cements, electro-optic materials, and gamma ferric oxide. Programme has been undertaken for the development of high permeability and high frequency ferrites, alumina ceramics, cathode insulators and transistor headors, high voltage capacitors for use in TV and other instruments. A pilot plant is being set up for the production of TV phosphors.

The laboratory has been making


Pilot plant to produce ferrite products

concerted efforts to create a strong base for the electronics industry. Processes have been developed for the manufacture of many electronic components such as silver mica capacitors, ceramic capacitors, hard and soft ferrite rods, and ceramic rods for carbon resistors. Ceramic capacitors are being produced by a number of firms utilising the NPL process. Research and development effort is continued with a view to improving the quality of products and at the same time reducing the cost of production. Knowhow has been developed for making liquid crystal devices (LCDs) for temperature measurement and display panels in electronics industry. Temperature senisitive LCDs help in reducing human suffering such as for the detection of tumors, cancer, leprosy, cold urticaria. These are also used for measurement of body temperature and family planning devices. Digital LCSs are used in wrist watches and electronic instruments.

In the field of carbon technology, expertise and infrastructure is available to develop any carbon product. A family of products like brushes and blocks, cinema arc carbons, process and search light carbons, midget electrodes have been developed and these are being commercially produced. Present production of cinema arc carbons alone is about one crore of rupees in 1976-77 and it is likely to exponentially grow to 2 crores in the next year. Knowhow is being released for the production of carbon thrust bearings, electrographite dynamo brushes, carbon granules for microphones. Work is in progress on the development of carbon fibres which will find use as re-inforcement material in making silos, fishing boats, corrosion free pipe lines, aircrafts and space vehicles.

The laboratory is also working on the development of ultrasonic instruments. Instruments and devices developed by NPL include ultrasonic interferometer for velocity measurement in liquids, ultrasonic transducers for remote control and automation, probes, linear displacement transducers and flaw detectors

The laboratory undertakes applied/developmental research in various fields to develop such technologies as may serve the immediate as well as the future needs of the country. Development of the electrostatic photocopying machine is an example of the laboratory's efforts in this direction Few thousand indigenous machines have been marketed saving crores of rupees in foreign exchange. An automatic photocopying machine is being developed. An electrofax type of photocopying machine has also been developed and knowhow is available for commercial exploitation. Knowhow for X-,XN – K –, S – and KU – band of microwave components has been successfully developed and the knowhow is being commercially utilized by three firms.

NPL has perfected the techniques of fabrication and reconditioning of cathode ray tubes and television tubes. Cathode ray tubes of 5UPI and 5AQP31 type with acceleration voltages of 1500 and 3000 respectively, and suitable for general-purpose oscilloscope, and 23 cm, 30.5 cm and 41 cm television picture tubes have been batch-pro-

duced and knowhow transferred to industry and reconditioning facilities have been started by the licencees.

A large number of laboratory instruments like linear drive for Mossbauer spectrometer and infrared spectrometer and multipurpose solvent extractor have also been developed. A Lang camera for testing the perfection of single crystals, such as of silicon, and measurement of dislocation density is another example of NPL's efforts to keep pace with emerging technologies. The laboratory has developed Penning and Pirani vacuum gauges, vacuum leak detector and natphyl vacuuo meter.

Cryogenic Research

The laboratory undertakes research in the field of cryogenics. Cryogenic equipment finds increasing applications in key industries like steel, petro-chemicals, fertilisers metal working, food and fish preservation. Work undertaken by NPL on the development of air liquefier and metallic containers is intended to establish facilities in the area of cryogenics. Solid Co_2 generator, cryoprobes for eye surgery, metallic dewars and double-walled evacuated vessels of spun copper have been developed successfully. Work is in progress for the development of Liquid N_2 machines and dewars for the purposes of artificial insemination Country's requirement of cryogenic plants is estimated at Rs. 450 crores during the Fifth Five Year Plan Meterological and diffraction gratings of very high line density have been made and supplied to other organisation for strain analysis work. In the area of thin film technology, knowhow is available for interference filters, neutral density filters, anti-reflection coatings and cold mirrors and their production has been started in the laboratory.

A Research & Development programme has been initiated in the field of solar energy. A solar space heating system has been designed and installed at BHEL on the NPL design. The laboratory has developed efficient solar collectors. Work is in progress for the development of solar pump and power generators for harnessing of solar energy or rural applications.

The laboratory has one of the best glass technology workshops in the country. This workshop prepares complicated glass equipment for use in the laboratory as well as for outside research and industrial organisations.

A pilot and demonstration plant in hydrostatic extrusion and material synthesis is also being set up under the United Nations Development Programme. Knowhow has been developed for making single crystal synthetic diamonds for use by machine tool industry. Knowhow is now being transferred to industry. Import of diamonds is nearly Rs. one crore per annum and its demand is likely to grow with indigenous availability.

Extensive work has been done in areas lihe the thermionic constants of metals, X-ray crystallographic studies of some potentially useful chaleogenides asregards phase transformation and thermal expansion, mpolyty and pis dislocations, defect entres in alkali halide crystals, Mossbauer spectra and interferometry. Work is continuing on transport properties of dilute alloys at low temperature, dielectric properties of solids and liquid mixtures, perfection and growth of whisker crystals, diffusion of impurities in solids, and image formation under partially coherent illumination by using spatial frequency filters. Several basic problems arising out of the work connected with standards and testing and developmental projects are in progress. Thus, for example the problem of Josephson tunnelling, which eventually would be used as a voltage standard, is receiving the attention of NPL

The laboratory has a strong and internationally recognized activity with two major objectives:

1. To assist in the current and future needs of all radio communication systems in India – the conventional broadcasting, television, VHF and UHF communication, satellite communication and tropospheric propagation.
2. To use the observed radio propagation characteristics for remote sensing of the earth's near space environment.

The NPL provides major services to Indian Radio Traffic Organisations, to research laboratories and universities, and to the Defence Services in all areas of radio communication. Special studies are also undertaken by the laboratory on users' requests. These are for radio communication for specific routes and under specific conditions for erroneous bearing given by homing beacons in mountaneous terrains, on freak television propagation, and similar problems. In 1971, an Associate Regional Warning Centre (ARWC) was established as a part of the International Solar and Geophysical Disturbance network. It serves the Indian Subcontinent, the entire South East Asia, and on the west the entire Middle East. The laboratory broadcasts daily through All India Radio through its Standard Time and Frequency Service and through Indian Meterelogical Department the solar and geophysical conditions of interest to scientists and communication networks. In the field of space research, one area of current interest is the beacon observation of the Satellite ATS-6 which is providing TV transmission directly to village receivers in a programme known as 'SITE' The laboratory has participated effectively in the Indian experiments with Rockets flown from Thumba.

An important technique which explores the earth's ionosphere by using the radio noise from the galaxy and has since found major uses in many areas of geophysical activities is the Riometer. A matter of special importance is that this technique was partly an Indian discovery. The equipment operating in the NPL backyards is one of the longest continuously running equipment of this type in the world.

A new and a very powerful technique for sensing the lower atomosphere presently upto 500 metres has been established. This is an Acoustic Radar called the SODAR It uses pulsed sound waves around 1000 Hz. This system has important applications in:

1. Tropospheric Radio Communication,
2. Meteorology,
3. Detection of Atmospheric Pollution.

The laboratory operates an extensive system of radio flare patrol using a wide variety of techniques.

NCL in Rural Development

H.B. SINGH
and
A.M. LELE

THE NATIONAL Chemical Laboratory (NCL) in Poona is the first of the national research laboratories and institutes set up by the Council of Scientific and Industrial Research (CSIR) New Delhi. Started in 1950, it is playing a part in the development of villages.

The work is done in the following 13 areas of industrial importance: petrochemicals and bulk organic chemicals; pesticides and agro-chemicals; drugs, dyestuffs and fine chemicals; organic intermediates; utilisation of plant, forest and marine products; industrial polymers, elastomers and resins; mineral resources utilisation; industrial inorganic and organometallic chemistry; solid state materials including materials for electronic industry; plant and animal tissue culture; fermentation technology; enzyme technology; and development of instruments.

The research work at NCL is recorded in 3,000 publications in India and foreign journals Nearly 50 patents are currently in force. Five NCL scientists have won the coveted Sir Shanti Swarup Bhatnager award and four have won the K.G. Nayak Gold Medal (awarded by M.S. University, Baroda) for contributions to industrial research. Several members of NCL staff are Fellows of Indian National Science Academy, the Indian Academy of Sciences and the Maharashtra Academy of Sciences.

Agriculture and Health

During the last decade, NCL's endeavour has been to promote self-reliance in much needed technology in several priority sectors such as health, agriculture and defence. Several technologies have been successfully developed in these areas.

Notable contributions towards development of pesticides technology are phenthoate and nicotine sulphate (from tobacco waste). Processes for dalapon and endosulfan have been released and are expected to be established soon. NCL technology is expected to be commercialised in the next few years for pentachloronitrobenzene, cycocel, maleic hydrazide, simazine, atrazine, nitrofen, tetradifon, carboxin, fenitrothion, dimethoate and ethephon. NCL has developed a new slow-release herbicide formulation which controls the growth of parthenium, an obnoxious weed. Other pesticides for which technology is under development are: paraquat, chlordane, imidan, phosvel, ethion, carbofuran and captafol. The total turnover of these pesticides and other agro-chemicals by 1980 is expected to be of the order of Rs 40 crore.

NCL has been successful in growing virus-free sugarcane and hybrid cabbage plants by the use of plant tissue culture technique. Extension of this technique towards rearing of newer and better varieties of food-grains (for example, wheat) by mutation and somatic hybridization is also under investigation. Studies in teak seed germination as well as attempts to propagate teak and rear medicinal plants such as dioscorea by plant tissue culture technique are under way

Large scale trials to test the efficacy of certain compounds in controlling loss of water due to evaporation are in progress with the collaboration of the Directorate of Irrigation Research and Development, Maharashtra State.

NCL has developed technologies for a number of drugs and pharmaceuticals (for example, opium alkaloids, vitamin C, and calcium hypophosphite) many of which are in production. Other pharamaceuticals and their intermediates in production are clofibrate, catechol, sorbitol, acriflavine, berberine hydrochloride, acrbide nitrate and carbimazole. The value of these drugs at capacity production is estimated to be Rs. six crore annually. In addition, NCL has also developed know-how for the following drugs: papaverine hydrochloride, xylit, phenoformin, metformin, diazepam, chlordiazepoxide, colchicine, theophylline, aminophylline and caffeine. Processes for the first five products have already been licensed to industry. NCL is presently engaged in developing technology for the following drugs: antrycide, tetramisol, naproxen, semi-synthetic penicillins etc.

Defence and Industry

NCL technology has been successfully exploited for dimethylaniline and monoethylaniline which are required in the production of tetryl and carbamite used in the manufacture of high explosives. Process technology for the production of sealants for aircraft and those required in atomic power plants are under development.

The polymer industry has made outstanding contributions to meet man's needs for new materials. NCL/'s success in this field has been quite significant. A 300 tonne per annum semi-commercial plant for nitrile rubber has gone on stream and a 2,000 tonne per annum plant with an estimated turnover of Rs. four crore has also been recently commissioned. Plants based on NCL technologies for the manufacture of ion exchange resins, adhesives, thermosetting resins, can sealing compounds, rigid filters, rubber blowing and reclaiming agents are already in production NCL is presently engaged in the development of technology of sulphochlorinated polyethylene, an important synthetic rubber possessing special properties.

Some of the organic intermediates now being commercially produced are acetanilide, chloromethanes, chlorobenzene, phthalate plasticizers, toluidines, monochloroacetic acid, nonylphenol, diethyl-m-aminophenol and ethylene oxide condensates. The value of production of the above items at rated capacity is estimated at Rs. 22 crore.

It is hoped that within the next two to three years, plants based on NCL technology will be established for aniline, P-cresol, ethylene diamine and morpholine. The value of output by these plants is estimated at about Rs. 15 crore.

NCL is presently engaged in the development of technology for the following intermediates petrochemicals; propylene oxide, acrylic esters, *o*-and *p*-aminophenol, *p* anisidines, butene-1, 4-diol, hexachlorocyclopentadiene, n-ethyl-*o* toluidine and pentachlorothiophenol.

Production of β-ionone, geraniol, citronellol and citronellal from Indian lemon grass and citronela oil has been established. Costly perfumery chemicals have been developed from low value by-products Δ³- carene and longifoline) of turpentine oil and are in commercial production. A plant for the production of oxalic acid from ain bark, a forest waste, has been established in Chandrapur in Maharashtra

Processes for the production of carbon tetrachloride and chloroform from waste methane gas, rubberised coir sheets from coir pith and cork wastes, sisal wax from sisal waste, nicotine sulphate from tobacco/tobacco waste, ion exchange resins, coating compositions and foundry core binder from cashewnut shell liquid, gums from cashewnut shells, and fructose from costus root lef tafter the extraction of oil are some examples of NCL's work in this area

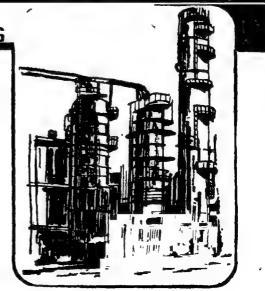
NCL has also developed a process for the production of rayon tyre cord and HMW grade pulp from hard and soft woods and is in a position to offer technology for a 100 200 tonne a day plant. It is also engaged in a major project for the conversion of cellulosic wastes into glucose, protein-rich cattle feed and compost.

India possesses rich mineral resources many of which have not been fully utilised. NCL has under taken several important developmental projects in this field. Plants for the production of calcium silicate and butyl titanate have been established. Work is in progress in collaboration with industry for the establishment of a semi-commercial plant for titanium tetrachloride and also for the development of technology for chlorosilanes, silicones and fumed silica starting from ferrosilicon. These products are presently being imported An innovative process for the benefication of ilmenite is also under development. These are also now being imported

An innovative cyclic process for the production of phosphatic fertilisers from Indian rock phosphate is under development. An innovative process for the manufacture of cryolite from fluorine-bearing gases has been developed in collaboration with industry.

NCL has developed technologies for thermistore, photocells, ferrites and a few sophisticated ar lytical instruments which w hitherto imported. Plants for t production of these items have be established. Work has also be undertaken for the development materials and devices useful for t utilisation of solar energy as p of a major CSIR effort on tl nationally important R&D prc ramme.

In accordance with the CSI policy of adoption of backward d tricts in the country for integrat development using science a technology, the NCL, in collabo tion with the Maharashtra Gover ment, has been involved in the p paration of an eco-system plan f the development of Chandrapu This document marks a deparatu from the normal approach of se toral development. The empha in the planning strategy here is using science as a conscious a deliberate tool for econom growth without detriment to e vironment. The eco-system pla also keeps the rural poor as t focal point for development. A tempts will be made to improve t life styles and purchasing power the rural population □

HERALDS OF NEW ERA—3


Strides By CLRI

THE CENTRAL Leather Research Institute at Madras, set up in 1953 is engaged in fourteen main areas of R&D, namely, raw hides, skins and microbiology, animal wastes and slaughter house byproducts; collagen; tanning and mechanism of tannages; leather auxiliaries; polymers; tanning and finishing; footwear and leather goods; tannery effluent and environmental biology; extension; technical training; leather trades engineering; economics and information

The task of transfer of technology is complex since the industry is age-old and exists at different levels, village, small, middle and large scale sectors whose interests are often conflicting. Over the years, appropriate technology has been developed and transferred to the cottage, small and middle sectors.

Impressive Achievements

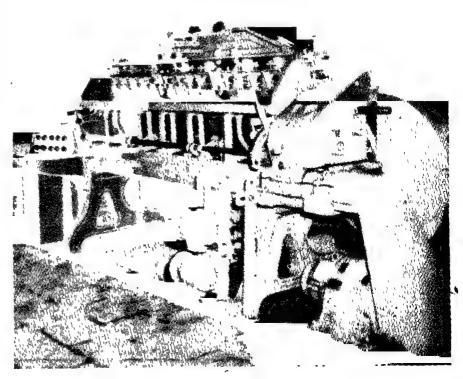
As a result speciality of leather items like pickers, picking band straps and all other industrial leathers for textile, jute and silk mills, which were imported formerly, are now made by the Indian leather industry. Vegetable tanning materials and some chemicals and machinery items specifically used in leather tanning and finishing were formerly being met exclusively from import Today the industry is using more of the indigenous materials which have proved equal and more than equal to imported goods The country has developed capacity to meet the local needs in full and also export some of the speciality leathers and tanning auxiliaries and tanning machinery Certain leatherware, for the exclusive use of the defence service personnel, formerly met from imports, are now made in the country. Technology transfer is effected through the base unit at Madras as well as through the five regional extension centres at Bombay, Calcutta, Jullundur, Kanpur and Rajkot. The special regional needs of the country are thus met.

At the time of the inauguration of this Institute in 1953, the value of leather and leather products in India was estimated at Rs. 45 crore and the corresponding figure today is Rs 580 crore. Leather and leather products worth about Rs. 27 crore were exported in 1953 and the value of current exports is in the neighbourhood of Rs. 313 crore. The composition of the exports has also been shifting from mainly raw hides and skins and semi-processed leathers to increasing finished leathers as well as sophisticated leathergoods Though it is difficult to assess the extent to which the Institute has contributed to this development, it has played a great part in the tremendous transformation that has come about in the structure of the industry. The Institute is providing know-how and technology for the manufacture of finished leathers, leather auxiliary chemicals and various types of machines required both for the tanning and leather-based industries.

In tangible terms the institute has developed so far about 200 processes and products and has demonstrated through its extension services about 500 processes to different sectors of the industry. It has published about 1,000 research papers and articles and has brought out over 100 techno-economic survey reports, project costings, market study reports and price studies.

Training Courses

The Institute is conducting training courses in various aspects that are of interest to the leather industry in our country in other developing countries. Trainees from Burma, Indonesia and West Asia, have often availed themselves of the facilities of training in this Institute. Scientists from the Institute have gone out to other countries to set up research institutes and to help the industry, for instance, in Sudan, Aden, Somalia, Iran, Nigeria, Nethantilles, Swaziland, Mali, Bolivia, Argentina and Yugoslavia. A unique feature of CLRI's activity is its collaboration with the University of Madras in training students for the Bachelor's,

Splitting machine developed by CLRI


master's and Doctorate degrees in leather technology.

In all about 1,500 students and trainees including those sponsored by the industry and trade and over 90 foreign students have gone through the portals of CLRI. More than 40 cottage tanners have received tailor-made simple leather processing techniques in the Institute.

The institute has today more than 50 organised firms under the retainer consultancy scheme. Annually, about 2,000 trade enquiries are attended to. The services of CLRI are offered on first come first served basis. The exception to this rule is the service offered to the rural sector, which is available whenever and wherever needed. This is free of cost

The Institute brings out technical monthly bulletins in English and Urdu and quarterly bulletins in Hindi and Marathi. The experts of the Institute serve on the ISI Committees, trade bodies, technical education committees and on export panels, constituted at the State or Central level from time to time to give the benefit of their technical views relating to leather and allied industries.

R&D Plans

The Government of India's present policy is that increasing quantities of finished leathers and leather products should be exported in place of the traditional export of semi-processed leathers which form the raw material for making finished leathers by the advanced countries. A target of Rs 600 crore worth of exports in the form of leathers and leather manufactures is to be reached by 1980. The R & D work involved will be considerable. One hundred and forty research problems, distributed over 13 major R & D areas of the Institute, which are of direct relevance to the current needs of the Indian leather and allied industries have been chalked up for research during 1977-78 and 1978-79.

In order that the R & D expertise available with the Institute in the fields of tanning, designing and fabrication of footwear, leather goods and leather garments, utilisation of tannery and carcass wastes, and treatment, control and use of tannery effluents may reach all sectors of the industry, an effective rapport is maintained by the Institute with organisations such as the Small Industries Service Institutes, Central Footwear Training Centres, the Khadi and Village Industries Commission and its regional boards and other science and technology laboratories. The Institute also maintains continuous liaison with technical and trade organisations abroad concerned with leather industries and forums of scientists and technologists devoted to R & D on leather and leather products in several developed and developing countries. □

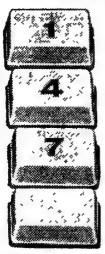
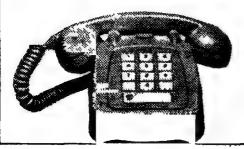
NOW TOUCH-A-NUMBER...AND LISTEN!


The new
ITI ASHOKA
PUSH BUTTON Telephone

Dialling becomes so much faster, easier. Fewer wrong numbers, too! On the sleek new ITI ASHOKA Push Button Telephone.

India's first Push Button Telephone with a built-in electronic memory, the ASHOKA has been specially developed for you by ITI, Bangalore, embodying the latest design and manufacturing advances in telephone technology

HOW IT WORKS

All you have to do is TOUCH YOUR NUMBER on the feather-touch keyboard. Dialling 'O' takes no longer than dialling '1' Positive action makes keying a simple movement, reducing dialling errors to the minimum


The ASHOKA's built-in electronic memory, with large scale integrated circuits, enables the digits pressed in quick sequence to be stored and pulsed out at the correct speed and ratio, thereby avoiding wrong numbers due to faulty dialling

The smart new ASHOKA adds distinction to its surroundings. Available in a range of attractive colours.

Ask ITI about it today!

THE REGIONAL Research Laboratory, Jammu & Kashmir, a multi-disciplinary research organisation was established in 1958 to promote industrial growth in the north-western Himalayas by developing technologies based on raw materials available in the region It has fourteen Divisions. These are: Applied Botany, Organic Chemistry, Mineral Resources, Cellulose Pulp and Particle Boards, Food Technology, Chemical Engineering and Design, Leather and Fur Technology, Mycology and Plant Pathology, Pharmacology, Plant Collection, Survey and Herbarium, Applied Zoology, Industrial Survey, Central Instrumentation and Surface Coating The laboratory has a branch laboratory at Srinagar and an Extension Centre at Palampur (H P)

A thorough study of various industries and their needs is conducted as and when requests are received Once a problem has been properly identified, a team of scientists/ technologists is brought into play with a clear cut aim. A definite plan of action and time target for its completion are fixed During the various stages, the progress is evaluated by modern methods of management Research development and Design facilities are offered to industries needing these on a cost to cost basis.

Extraction of Borax

Borax is a strategic mineral and is extensively used in many industries including pharmaceuticals, glass and ceramic. India entirely imports this versatile chemical spending considerable foreign exchange. The one known deposit is located in Puga valley. Apart from the existing deposits annual replenishments are also about 550 tonnes of borax.

The Jammu laboratory has developed the technical know-how for extraction of borax from crude tincol ore available in the Puga valley. A one-tonne plant was installed by the laboratory. A novel feature of the plant is that it utilises geothermal energy for processing of crude borax The plant is solely designed, fabricated and commissioned by the scientists of this laboratory

The technical know-how had been given to J & K Minerals Ltd. for exploitation of crude ore since 1976. The party has already produced a good amount of refined borax and now intends to increase the capacity of the plant five-fold.

Chir pine needles are available in the forests in huge quantities. Every year these needles fall down from the pine trees and get dried up The dry needles pose a fire hazard to the forest and also inhibit the regeneration of new plants It is estimated that the annual fall in J & K and H.P alone is about 0 27 million tonnes. Presently these needles are not being put to any use This laboratory has developed processes for the manufacture of fibre board and pine wool from these needles The process developed for fibre board manufacture avoids depletion of valuable forest wood A two tonne a day plant based on know-how developed by the laboratory was set up by the H.P State Forest Corporation at Bilaspur. The unit went into operation in June, 1976 Fibre board produced can be used for making boxes, picture frames, panels, air bags, ceiling etc

The process for the production of pine wool has been released Pine wool can be used for stuffing material in mattresses, cushions and furniture and for packaging fragile articles

Dehydration of Apricots

Solar energy has successfully been harnessed for the dehydration of apricots in the Ladakh region of J&K Conventionally drying of apricots requires 25 to 30 days. The fruit gets decayed due to prolonged drying time. After studying the drying characteristics of apricots, a solar cabinet drier was designed and developed for speedy and hygienic dehydration of these fruits. This works on natural wind and solar energy. The operatio cost is negligible. The equipmen simple in construction and can fabricated even by village artis using indigenous raw materi Fruits that normally take 25 to days for drying in the open sun dried in just three days with marl improvement in product, qual and storage characteristics.

Twentytwo units were fabrica in 1976 and supplied to the farm to invoke their interest in the ap cation of this technology to th produce From the response units received and the enthusia of the farmers, it is expected that major portion of this crop will processed by solar dehydration.

Fur and Suede from Sheep Ski

Large quantities of sheep a goat skins are daily available a byproduct of slaughter houses the region. At present these sk are mostly sent out of this area raw condition in spite of the f that they could be utilised loca for making furs and suedes.

A full-fledged fur and wool te nology block equipped with mode machines and equipment has recen been set up in this laborato The R & D work has indicated t these skins can be converted i different grades of furs, fur sue and plains suedes suitable for in the fabrication of sleeping ba jackets, caps, cushions etc. Th products have been displayed traders to show the versatility finished furs and suedes.

Medicinal and Aromatic Plants

Seeds and planting materials ha been developed and passed to g wers for commercial cultivatic These are Ergot on Rye; M. pi rita; M citrata; M. arvensis; Jamı lemon grass, RRL-14; Eucalyp citriodora; Atropa belladonı Ammi majus; Solanum Khasian and Datura innoxia.

Cultivation of Hops

Hops is a material greatly in mand by the breweries of the coun and is imported to the tune of one crore annually. It has for t first time been established as a co mercial crop by this laboratory Kashmir. A number of brewer and farmers in Kashmir and H. have taken to its cultivation. W this rate of progres we may so hope to be self-sufficient in t hitherto entirely imported r material.

Tariners in Kashmir and Himachal have taken to Hop cultivation

Mushroom Industry in Kashmir

Mushrooms are fungi which belong to the lower forms of plant species. Their edible varieties are known to be very delicious. Unlike other cereals and vegetable crops, this culture needs a lot of care and expert handling at every stage of their growth They are grown in trays on suitable suastrates, seeded with specific spawns, in a room conditioned to previously determined range of temperature and humidity Substrates, the main constitutent of which are usually the agricultural waste materials like straw, constitute the soil and spawn, the seeds for mushroom cultivation.

With the efforts of this laboratory mushroom cultivation is a household affair in the valley. The programme has proved to be a boon to farmers and entrepreneurs.

Production of Diosgenin

One of the major achievements of this laboratory is the setting up of a chain of three plants for the commercial production of diosgenin from *Dioscorea deltioda* which is a steroidal sapogenin used as an intermediate in the manufacture of oral contraceptives, sex hormones etc. The combined production by the firms has been estimated at Rs. three crore.

The laboratory has developed *costus specious* rhizome as new raw material for diosgenin-starting material for the synthesis of sex hormones. At present the main source of diosgenin in India is *dioscorea deltoidea.* The supplies of this material are, however, limited. *Costus spceiosus,* occurring throughout the foot hills and plains of India, has been found to be an ideal supplementary source of diosgenin. Extensive surveys have been undertaken in all parts of the country to assess the resources A massive programme for chemical screening of thousands of rhizome samples obtained from various parts of India has been initiated. Multilocation cultivation trials have revealed the capacity of the plant to grow under different agroclimatic conditions Semilarge scale cultivation of this plant at Jammu offered about 13 tonnes of dry rhizomes per hectare yielding about 50 kg of diosgenin.

Progesterone is an important female sex hormone and is used as a remedy for abnormalities of menstrual cycle It is also widely employed in the maintenance of pregnancy.

Progesterone is a costly drug and, therefore, development of an indigenous process for its manufacture starting from diosgenin is quite economical There is also considerable export potential for this drug The process developed by this laboratory is facile and employs only indigenously available solvents, chemicals and equipments The overall yield is about 25 per cent of the weight of diosgenin.

A separate cell is being established as a demonstration unit for the entrepreneurs to get training in the production of 16-DPA and progesterone Progesterone produced is of USP grade

This process has already been released to two parties

Process for Citric acid

Citric acid is an important organic acid found naturally in citrus fruits. It is now being manufactured by a few multinational companies in the world by fermentation process. It is such a complicated process that most of the manufacturers have taken 20 to 25 years of extensive R & D work to develop this process India is importing citric acid worth one crore rupees a year. The demand is expected go to up. It was felt that the country should have an indigenous process for citric acid manufacture so as to be self reliant and independent of the foreign monopoly houses. Keeping this in view, a process ha been successfully developed on 400 lit. fermenter level. Complete know how of the process is being provided for setting up a plant with an initial capacity of about 400 tonne a year.

Menthol from Mint Oil

Production of menthol in India is the result of the efforts made by this laboratory in introducing *M arvensis* in this country and producing menthol crystals therefrom As the production has taken roots there has been accumulation of dementholized oil from which it is possible to obtain menthol crystals by the chemical process developed by this laboratory. During this period a small pilot plant has been set up for demonstrating the production of menthol from dementholised oil The process is sold to several entrepreneurs who are supplied with project report, giving full process details, design and drawing specifications of equipment The entrepreneurs have also been trained in the production techniques A process has also been developed to obtain holder crystals of menthol usually referred to as "Japanese crystals". Such large crystals have been produced for the first time in the country.

After establishing 'the credibility of technology of menthol production in the small scale sector in India, this laboratory has been asked to set up a pilot plant in Burma to manufacture 3000 kg. of menthol per annum. This is one of the ten pilot plants which India is gifting to Burma through the NRDC

The programme of the Laboratory for the coming two years includes. extraction of potash from the Tsokar lake in Ladakh, production of Citronellol, geraniol, gibberellic acid, ergot alkaloids and biomass by submerged culture, completion of clinical trials on the drug scoparone and developmental work on vasicine, developmental work on the utilisation of raw sheep skins into high quality simulatiosn and fine suedes and work on apple juice and apple juice concentrate. ...

"The supreme consideration is man

-Mahatma Gandhi

Mint, Lemongrass and Eucalyptus

G. THYAGARAJAN

THE REGIONAL Research Laboratory, Jorhat is one in the chain of laboratories under the Council of Scientific & Industrial Research. Established in 1959 the Laboratory seeks to put to effective use the immense material resources of this region, to develop the economy of the States, and to function as a link between the state organisations and other national laboratories in solving problems requiring specialised attention, undertakes R&D activities for effective utilisation of minerals, agricultural and agro-industrial wastes, forest and energy resources of this region; works on introduction, acclimatisation, propagation and improvement of medicinal and other economic plants RRL-Jorhat also provides scientific and technological inputs for the industrial and economic development of the region in particular and the country as a whole by way of offering consultancy services, analytical and testing facilities, fabrication of plants, special equipment and pilot-plant facilities. The laboratory accepts ad-hoc research projects sponsored by industries and renders all possible help in transferring the technology generated in the laboratory The areas in which the Laboratory is now working are:Applied Civil Engineering, Analytical services, Biochemistry, Chemical Engineering, Coal, General Engineering, Geoscience, Inorganic Chemistry, Medicinal and Economic Plants, Organic Chemistry, Papers and Boards and Petroleum and Natural Gas.

Some of the important achievements made by the multidiscipline Laboratory during the last decade are given below:

Phyto-chemicals

The North Eastern Region consisting of Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura is very rich in medicinal, essential oil bearing and other economic plants, so essential for our plant based chemical industries. The Laboratory has taken up extensive research for development of know-how for the cultivation of essential oil bearing plants like Basil, *Citronella, Eucalyptus citriodora,* Japanese mint, Lemon grass, Palmarosa and Pepermint. Essential oils are mostly used in perfumery, pharmaceuticals and cosmetic industries. Although some oils are produced in the country, there is a widening gap between the demand and production also. The Laboratory has made much headway in popularising the cultivation of the oil bearing plants in this part of the country With the help of Laboratory's know how and planting materials about 6000 acres of land have been brought under the cultivation of citronella by the farmers in this region. As the indigenous production of citronella oil is now adequate, the Government of India has totally banned the import of citronella oil from abroad This Laboratory has also developed a process to fractionate this oil into citronellol, citronellal, geraniol and other higher value products having export potential Besides citronella oil, know-how and planting material for cultivation of *Mentha arvensis, N Piprtiys,* Pilmarosa, *Euvalyptus citriodora* and lemon grass have been provided to a number of entrepreneurs. The Laboratory has studied the possibilities of establishing a lemon grass oil industry in Lumla area based on the grass, growing naturally in that region. The Laboratory has supplied the Arunachal Pradesh Administration a distillation still for extraction of lemon grass oil. Training has been imparted to some local people for the cultivation and distillation of lemon grass. A good number of distillation stills for extraction of essential oils have been provided to a number of other parties. Besides essential oil bearing plants, know-how for cultivation of medicinal plants such as Dioscorea sps. Solanum sps. etc. and extraction of active principle therefrom have been developed in this Laboratory. The tuber of diocorea yields diosgenin. The berries of *Solanum khasjanum* contains solasodine· Both diosgenin and solasodine serve as source for 16-DPA, a starting material for storoids. A number of parties in Assam are taking up large scale cultivation of the *Solanum khasianum* under the technical guidance of this Laboratory. Experimental cultivation of Dioscorea is being taken up by the Laboratory at Tripura and *Solanum khasianum* in Mikir Hills under the auspices of Assam Hills Development Corporation. Besides research activities relating to introduction, acclimatisation, ropagation and improvement of some other economic plants such as Costus sps, Pyrethrum, *Valerium Eallichu* etc. are in progress On large scale exploitation of the know-how developed in this Laboratory, a N.E. India may provide a rich base for various phyto-chemicals for which there is a great demand in the country

Drugs and Pharmaceuticals

The Laboratory has developed the technology for manufacture of caffeie caffeine from tea waste. Caffeine is an important drug and the current total requirement of this drug is about 100 TRA and the estimated

Carbon black is extensively used by rubber and tyre industries

Dr Thyagarajan is Director, RRL, Jorhat.

demand of caffeine by 1978-79 is about 160 tonnes Caffeine is also used for making the phylline, and aminophylline, two other important drugs. Based on the know-how developed at RRL, a firm at Jorhat is producing about 90 kg of caffeine per day. It is estimated that if all the tea waste available in the country is funnelled into production of caffeine, about 200 TRA of caffeine could be manufactured in the country, which will not only meet the domestic demand but also enable the country to export the surplus caffeine. Processes have been also developed for theophylline, choline chloride, p acetamel, phenylbutazone and diethylamino-ethanol. These processes have been licensed to a number of parties

Pesticides and Agro-Chemicals

Pesticides and agro-chemicals occupy a key position in increasing our food production The country spends a substantial amount in foreign exchange for importing basic pesticides as well as the formulations The Laboratory has been working on development of process know-how for organophosphorus pesticides such as phosphomidon, quinalphos and chlorovenvinphos based on indigenously available chemicals The work on quinalphos and phosphomidon are in advanced stages of development. A number of firms are showing keen interest in the exploitation of this know-how

Organic Chemicals

Processes for making oxalic acid from saw dust/molasses, tertaric acid from tamarind leaves, Dinitroso-pentamethylene tatramine (D.P.T.), furfural, Diphenyl and tri-n-butyl phosphate are in various stages of development. The technology on oxalic acid, tartaric acid and furfural have already been transferred to parties for exploitation and the process for making D.P.T. is in commercial producion

Petroleum and Petrochemicals

Petroleum wastes are being utilised by the Laboratory for making valuable waxes. One such process which is being exploited by industry is microcrystalline wax from sucker-rod wax, wax scrapping and tank bottom sludge. Microcrystalline wax is used in making carbon paper, grease and water-proof coatings, match, adhesive etc. The other process which is under implementation is regeneration of used lubricating oil. Work on development of making Dibenzyl disulphide, thymol and diphenyl are in progress. Work is being continued for preparation of a product having fire resisting properties out of aromex, a waste material of oil refineries. The Regional Research Laboratory has developed a flow improver from totally indigenous raw materials, which on incorporation in small doses can make the high waxy crudes amenable to piping. This technique will be the most economical way of transportation of crudes from production site to refinery

Resin Plasticisers & Plastics

Considerable amount of R&D work has been done for development of process know-how for moulding powder from agro-industrial wastes, lamination of boards using indigenous materials, triphanyl and tricresyl phosphates – two important plasticisers. These technologies have already been transferred and the last two processes are in commercial production.

Industrial Inorganic Chemicals

Aluminium sulphate, Silica gel, Silica sol, Potassium silicate, Sodium hydrosulphide are a few of the important inorganic chemicals developed in the Laboratory. Aluminium sulphate is flocculating agent finding use in water purification, and paper and textile industries Conventionally it is made from bauxite. The RRL-Jorhat process is based on alumina-rich clay available in some parts of N.E India. Sodium and/or Potassium Silicate, can be had as by products of this industry. Silica gel is an important chemical which is used as descicant and Slica sol is used in textile, ceramic and chemical industries The process developed at RRL yields about 99.9% pure Silca gel. Based on the Laboratory's know-how a number of parties are manufacturing Silica gel commercially. RRL-Jorhat has also developed a dispersant agent for effecting suspension of clay materials present in iron ore fines and also for beneficiation of certain other minerals. Process has been also developed successfully in this Laboratory for making cold bonded iron-ore pellets using a binder. Work on utilisation of paddy husk for making useful products such as refractory brick, Sodium Silicate, Active Silica, Silica pozzolona and molecular sieves is in progress.

Coal and Related Products

The N.E. region of India has abundant coal resources. But due to the inherent characteristics like high-sulphur content have no rightful uses. The Laboratory has been working to diversify the use of these coals. A process has already been developed for making carbon black from Assam coal Carbon black finds extensive use in rubber and tyre industries and there is great demand for this product in this country. The conventional raw-materials for Carbon black are oil, tar or gas wich are scarce and costly. Besides Carbon Black, the RRL-Jorhat process yields high temperature char as by-product. The process will make best use of Assam coal in terms of valorisation of the raw material to higher value product, diversify the use of Assam coal and conserve a substantial quantity of foreign exchange required for import of Carbon black. The process offers attractive yield and good product specifications and has recently been licensed. The Laboratroy also developed the know-how for making channel grade Carbon black from naturalgas at the instance of ONGC Laboratory scale investigations for desulphurisation of high sulphur oil has been completed Fluidised bed combustion of coal is getting much importance in recent years in view of the present energy crisis The Laboratory has been working for development of the technology for combustion of high sulphur coal of Assam in fluidised bed to generate thermal energy and simultaneously abate the air pollution by arresting the sulphurous gases Bharat Heavy Electricals Ltd, is collaborating in this work

Bio-Chemicals

India imports sufficient quantity of fermentation products. Countries like Japan have made much headway for manufacture of most of the product through fermentation technology Jorhat Laboratory has built up the necessary infrastructure for carrying out R&D work in this area Processes relating to production of active dry bakers, yeast, pharmaceutical grade yeast from molasses and Bromelain, a proteolytic enzyme from pine-apple waste have already been made available for commercial exploitation. Work is continuing to develop processes know-how for industrial enzymes and micrabial fats.

Building Materials

In collaboration with Central Building Research Institute, RRL-Jorhat has developed a process for

production of corrugated roofing sheets (Paper board) for low cost houses. These sheets are water and fire resistant and are suitable for temporary low cost houses. The life of the boards is 10-12 years and the cost of production about a rupee per square foot. Processes for making building bricks and cement like products from paddy husk have been worked out. Know-how for making boards out of paddy husk has been developed. The Laboratory has worked out a formulation using indigenous raw materials which can be used as an additive for oil well cement. Extensive experiments carried out both in Laboratory and field conditions are giving encouraging results. This additive can substitute the one which is being imported into the country at substancial cost. The process has already been licensed

A vertical shaft kiln process for manufacture of portland cement has been evolved The process is highly versatile and the components are available in the country. This process has been licensed to a firm in Kutch which will set up a factory in Bhuj On successful implementation of this technology by this firm, licences will be issued to others for utilisation of the know-how. The shaft kiln has also been utilised by the Fertiliser Corporation of India for recovery of sulphur from pyrites. A gear device has also been developed in this laboratory which can be incorporated in bicycle with minor modification A firm in Bangalore will manufacture this item based on the Laboratory's know-how. The Laboratory has also developed the design of distillation still for extraction o efssential oils. Such stills fabricated by this Laboratory are in operation in different parts of this region.

Paper Products

The country spends a large amount in foreign exchange for import of a variety of speciality papers required in various industries The Laboratory has been working on development of know-how for making these types of paper utilising the indigenous raw-materials. The processes which are made available for commercial exploitation are – Matrix board for rubber stereo and stereo-flong, Correction paper, NCR paper, Direct copy paper and Thermographic paper. Of these processes, Correction paper, Direct copy paper and Matrix board are already in production. Work is in progress for developing process know-how on Industrial filter paper, Gasket paper etc.

Processes for Rural Cottage Industries

In order to suit the need of cottage and microscale industries the Laboratory has developed a number of processes. These processes do not require much capital and skill. Paper slate, Plastic slate, Water filter candle are a few of this kind. All these processes are in commercial production. The first three processes have been taken by more than fifty parties in the country.

Geo-Science

The Geo-science division of the Laboratory is making studies relating to the siesmicity, microzoning of high seismic area and seismic factor at selected sites of N.E. India Investigations on selected problems in Geodynamics having important bearing upon distribution of petroleum and other minerals are also being carried out. The study includes theoretical modeling in the light of plate convergnce concept to correlate the occurance of intermediate earthquakes, ophiolitic rock sutes with the distribution of mineral deposits It has been observed that a prima facie correlation exists with the manifestation of intermediate earthquakes, polymetallic deposits and minerals like petroleum. These theoretical model studies have considerable importance in the context of the difficult terrain and complex geology of the region.

Experimental Stations in the N E. Region

In order to assess the regional resources and to adopt R&D activities appropriate to the regional and national needs, to offer expertise, consultancy, design and engineering facilities and analytical and testing services to the N.E. states and to fill the communication gap between these states and CSIR Laboratories and on the basis of requests from respective states, the Laboratory has established three sub-stations in Imphal (Manipur), Shillong (Meghalaya) and Yaong gyimsen (Nagaland). Experimental-cum-demonstration farms on medicinal and economic plants are functioning in these sub-stations. Steps are in progress to establish two more sub-stations in the states of Arunachal and Tripura In the mean time the Laboratory has set-up a paper slate industry in Yaongimsen village and handed over to the local people for its management. Earlier, the Laboratory through the financial assistance of the Industries Department of Nagaland setup a 600 kg per day distillation unit on turn-key basis to distil the citronella grass cultivated by the villagers under the technical guidance of this Laboratory. The distillation unit is in operation since May 1975. Experimental cultivation of Dioscorea has been undertaken by the Laboratory at Sipanijhola in Tripura. Pyrethrum, a plant having insecticidal properties is being tried in Meghalaya

Other Activities

The Laboratory has been providing testing facilities and consultancy services to individuals, industries and Government and private sector undertakings. In association with the Arunachal Pradesh Administration, RRL-Jorhat organised a botanical exploration in Tawang area of Arunachal Pradesh. NBG. Lucknow, RRL-Jammu and Botanical Survey of India, Shillong also collaborated with the Laboratory. The objective of the exploration was to locate and assess the medicinal, essential oil bearing and economic plants and explore the possibilities of establishing industries based on these resources. The survey party collected more than 100 plant specimens having economic value and suggested four small and medium scale industries based on these resources. A scheme has been prepared by the Laboratory for making different variety of paper out of "Suga Sang" bark available in Arunachal Pradesh. RRLJ orhat has also imparted training to some local people of Arunachal for making the paper and distillation of oil from lemon grass which grows wild there.

Regional Research Laboratory, Jorhat will concentrate its activities in the coming years on maximising its inputs in the selected areas by establishing interdisciplinary, interlaboratory and interinstitutional linkage Efforts will be also made to increase the level of the technologies developed and transferred. The Laboratory will also try to develop more appropriate technologies for rural areas based on the resources of these areas which will lead to dispersal of technology in rural areas, generate employment opportunities and build-up rural economy RRL Jorhat also proposes to adopt more villages in industrially backward areas in association with other developmental agencies and try to change the face of these villages.

Coals, Oils and Papers

THE REGIONAL Research Laboratory, Hyderabad (RRLH), one of the national laboratories under the Council of Scientific and Industrial Research is engaged chiefly on development of know-how for chemical industry, utilization of indigenously available raw materials and endering assistance to existing ndustries. The principal areas of vork are organic chemicals and ntermediates; pesticides; utilisaion of low-grade coals; vegetable ils; surface coatings; speciality apers; cellular and molecular bioogy; chemical engineering; comuter methods and design and ngineering

The laboratory undertakes sponored research on behalf of Industry. t also acts as General Technical Consultants to Industry The laboatory has well-equipped pilot lant and workshop facilities There re nearly 325 scientists and enineers on its research staff In the levelopment of know-how, studies re carried out on a bench scale or ilot plant scale and sometimes ven on a prototype plant scale. nvariably basic designs and someimes detailed designs are also proided along with process know-how, epending upon the requirements of he client. Nearly 80 processes eveloped by the laboratory have een released to industry for comercial exploitation, of which bout 40 are in production.

Some of the products and proesses for which technology has been eveloped are:

Organic Chemicals and Intermediates

This is one of the important areas here RRLH has made significant ontribution by making the coutrny elf-sufficient in many of the chemials.

Know-how has been developed or production of a series of chemials starting from toluene, a byeroduct of coke-oven/ petrochemical industry. The chemicals are enzyl chloride, benzyl alcohol, enzyl acetate, benzyl benzoate, enzo trichloride, benzyl cyanide, enzoic acid, phenylacetic acid and henylacetamide which are used in the drug, dyestuff and perfumery industries. Two commercial plants based on RRLH know-how are in production – one at Hyderabad and the other at Daurala near Meerut, meeting almost all the country's requirements. The process for benzyl chloride is based on continuous chlorination and operates trouble-free, whereas many of the plants all over the world are known to suffer from polymerization.

A process for monochloro acetic acid, an organic intermediate has been released for commercial exploitation. Know-how for cyanuric chloride, which involves complicated reactions has been developed under sponsorship of a leading chemical firm. Cyanuric chloride is used in the manufacture of dyes and pigments. Know-how has also been developed under sponsorship, for glyoxal, a textile finishing agent. Conditions have been worked out on bench scale for making epichlorohydrin from propylene, which is a downstream byproduct of petrochemical industry. Epichlorohydrin is used in the manufacture of epoxy resins and plasticizers. Glycerol is obtained as a valuable byproduct. The laboratory is in a position to offer technology for the production of acetic acid, acetic anhydride and acetaldehyde, in collaboration with a leading firm manufacturing these chemicals. A catalyst has been successfully developed for hydrogenation of benzene to cyclohexane, an intermediate in the manufacture of nylon. Upscaling work is planned in collaboration with the Gujarat State Fertiliser Corporation

Drugs and Pesticides

Processes developed (under sponsorship) for diazepam, the well-known tranquilizer and clofibrate, an anticholesterol drug, are in commercial production. Methaqualone, a non-barbiturate hypnotic earlier synthesised in the laboratory is being produced and marketed by leading firms all over the world.

Several organic compounds synthesised in the laboratory have shown promising pharmacological activity and one of the compounds (RH-8) has been found to have high anti-inflammatory activity in actual clinical trials and is likely to be marketed by a leading Drug firm in the country.

A number of pesticides have been identified at the national level for which know-how is being developd expeditiously. A well co-ordinated R & D programme has been drawn up and RRLH is collaborating with National Chemical Laboratory, Poona and Regional Research Laboratory, Jorhat, Assam, in this programme. The Laboratory has already built-up expertise in this area and developed a few pesticides, for example 'Citicide' and Methoxychlor, substitutes for DDT (the latter project under sponsorship from industry); 2, 4-D, a weedicide; MBC, a fungicide (sponsored by industry). With the coordinated efforts, the CSIR will be making significant contribution towards self-sufficiency in this important area.

Agro-products

Cottonseed Products: Pilot studies have been carried out on the many aspects of cottonseed processing. The work gave considerable fillip to the expansion of cottonseed oil industry which today contributes substantially to the edible oil resources of the country. A process for making chemical cotton from linters has been worked out. Chemical cotton finds use in many industries, e g. rayon, photographic films, gun cotton Methods have been developed for production of edible grade cottonseed flour. The flour is rich in proteins, specially lysine, an essential amino-acid and is bound to become an important protein source specially for vegetarians. Meanwhile the flour has found use as fermentation medium in tetracycline (antibiotic) manufacture and the requirements of some of the industrial units are being met from the pilot plant production at the laboratory.

Castor-based Products : India is a major producer of castor oil. But most of it is exported whereas it would be more advantageous to first convert it into industrial products and then export. RRLH has developed processes for making hydrogenated castor oil (HCO) and dehydrated castor oil (DCO) which are now in commercial production. HCO is used in making high pressure lubricants and DCO is used in good quality paints.

Cashewnut Shell liquid (CNSL): CNSL is a dark coloured liquid obtained in the processing of cashewnuts and does not find market as such. Proper utilization of CNSL is important for the economics of cashewnut industry which depends considerably on exports. Methods have been developed for upgrading and distillation of CNSL as well as for production of surface coatings from CNSL Based on this work, two commercial plants are in production, one in Hyderabad and the other in Bombay.

Active Carbons : Active carbons are widely used in chemical, pharmaceutical, sugar and other industries for decolourising purposes. Extensive work has been done on activation of various carbonaceous materials like wood charcoals, char obtained from carbonization of coal, etc A commercial plant based on pine char has been set up in Himachal Pradesh and is in production. The laboratory has supplied design and will be commissioning a saw-dust based active carbon plant for M/s Excelsior Chemicals Inc. at Manila, Philippines.

Speciality Papers . Know-how has been developed for special types of papers like drawng, document, and filter papers and for filter pads which are in large demand in the country, and which are still imported. These papers can be made from cotton linters, hosiery waste and tailor cuttings The process has been licensed to three parties of whom one has already gone into production.

Mineral Products

Low-grade Coals: Extensive studies have been carried out on low temperature carbonization of coal for production of smokeless semi-coke which can be used as a domestic fuel replacing the traditional non-fossil fuels like firewood and charcoal. A commercial plant is being set up by the Singareni Collieries Co. Ltd., at Ramakrishnapur in Adilabad district, Andhra, Pradesh. The plant which will have an initial capacity of 900 tonnes/day to be later raised to 2700 tonnes/day is expected to meet a large part of the domestic fuel requirements of the urban population in Andhra Pradesh and adjoining areas. RRLH provided the know-how and basic designs for the plant and M/s Engineering Projects of India Ltd., provided the detailed engineering.

Bleaching Earths: Naturally occuring Fuller's earths can be activated by heat or acid treatment to obtain bleaching earths. The activated earths can be used for decolourisation of vegetable oils and mineral oils. The Fuller's earth deposits available in the various parts of the country have been evaluated to assess their suitability for activation. Based on the process provided by RRLH a commercial plant is in operation at Korvi near Gulbarga in Karnataka.

Glass-lining Enamels : Glass-lined equipment is required by chemical, pharmaceutical and other industries The process know-how for glass-lining is a closely guarded secret RRLH has succeeded in developing compositions suitable for lining cast iron and mild steel vessels The process is under commercial exploitation

Silicon Carbide . Know-how has been developed for production of silicon carbide, a strategic material widely used in abrasive, refractory, electrical and other industries The know-how is a closely guarded secret known only to a few companies in the world. A commercial plant has been set up in Orissa based on RRLH know-how.

Inorganic Chemicals : Know-how has been developed for a number of inorganic chemicals e g hydrazine hydrate used in pharmaceutical industry and water treatment; sodium azide used in making detonators; anhydrous calcium sulphate, an efficient desiccant, x-ray grade barium sulphate, kaolin B.P , and aluminium hydroxide gel used in pharmaceuticals. Some of these chemicals are in commercial production

Design and Engineering

The laboratory has been laying great emphasis on developing this activity, as it is a weak link in the innovation process The Design and Engineering Group of the laboratory has already successfully completed a number of assignments on design of commercial plants Of these mention may be made of the plants for hydrazine hydrate, MBC, activated carbons, low temperature carbonization and sodium sulphate. Besides in-house projects, the Group undertakes design of plants based on process know-how supplied by the clients.

Cellular and Molecular Biology

Significant contributions have been made to basic research in the areas of preparation and properties of cell suspensions, reproductive biochemistry, regulation of growth, cell division and malignant tran formation and regulation macr molecular synthesis.

A new method for the prepai tion of rat liver cell suspensions h been developed. This method u like the earlier ones uses enzymes disperse the tissue and is widc used.

A new model of regulation cf c division and malignant transfo mation has been proposed. It suggested in the model that regul tion of growth occurs through negative control of the uptake essential nutrients

Studies carried out on transl tional errors in E coli present tl first substantial evidence of caus tion of extensive translational erro in a whole cell system under norm conditions of growth

A new group of proteins, name "Seminalplasmin" have been isola ed from bovine seminalplasma Sem nalplasmin is the second antim crobial protein isolated from anim sources. It is also a potent inhibit one of the most potent known transcription. It shows a most r markable specificity. This group proteins has considerable potent from the commercial point of vie also for use such as anti-bacteri agent.

Future Programmes

Attention will be paid on extra tion and utilization of minor o seeds to augment vegetable oil r sources Technical assistance w be given for the setting up of min plants in the countryside whe there is availability of these seed Technology will be provided for tl splitting of the oil into fatty acid Work will be continued on prepara tion of useful products from cast oil namely, tallow-like hard fats f soap-making, hydrogenated cast oil fatty acids and dehydrated ca tor oil fatty acids which find appl cation in greases, surface coating and plasticizers,

Efforts will be concentrated o development of technology for number of pesticides which are r quired to meet the growing requir ments of agriculture. The pest cides on the programme include mc nocrotophos, carbofuran, eno phosphates (DDVP etc.) and quinolphos (the last one in co laboration with Regional Researc Laboratory, Jorhat).

Considerable effort will be direc ed towards development of know how for organic intermediates requ ed in the production of pesticides

(*continued on page* 73)

SAFER TRAVEL—1

For Better Roads

THE CENTRAL Road Research Institute (CRRI), is functioning since 1950 under the CSIR as one in the chain of the National Laboratories. Its activities encompass research on highway engineering in its varied aspects, including road traffic safety. The objectives, identified in consonance with the prevailing needs include developing technology for investigation, design, construction and maintenance of different types of roads, bridges and runways in different regions of the country to achieve judicious rationalisation of the methods involved so as to effect otpimum economies and efficiency; developing labour intensive methods for construction of cheap all weather village roads to provide greater employment opportunities to the rural population and thus aiding the backward areas towards further development; developing tools, instruments and appliances related to highway technology to achieve self-sufficiency; carrying out research on characteristics of different types of road under different traffic conditions, incidence of accidents, road safety devices, psychology of road users, transport engineering and transport economics, rendering technical consultancy services to organisations in the related fields to avoid import of foreign expertise, training of road technologists for efficient and successcessful implementation of the road development plans of the country and disseminating technical information pertaining to highway engineering and allied subjects

New Techniques and Findings

With the changed traffic pattern, it became imperative to improve upon conventional highway engineering techniques or evolve new ones particularly suited to the diverse climatic, traffic and physical conditions which characterises the vast Indian sub continent. The major task today is the upgrading of the existing road net-work to suit the changed traffic conditions and the expansion of the road network to meet the outstanding needs, especially of the rural populations.

On the design aspect of roads, a number of scientific techniques to replace conventional and more or less approximate end empirical design methods, have been evolved. Advanced stress studies and studies on temperature differentials in concrete pavements have resulted in a scientific incorporation of these stress factors in design procedures. Designing of pre-stressed concrete pavements has been attempted in the laboratory and tried in the field with success. The work on the design of precast cement concrete pavements for use in emergency constructions, desert areas and city streets is in progress.

In bituminous surfacings, ston aggregate constitutes a sizable co component. The technique of pro viding this sand-asphalt surfacir in place of conventional two co surface dressings or open grade premix surfacings, for regions whe stone aggregate is costly, has bee improved. Investigations have al shown that the conventionally use crushed stone as coarse aggregate i bituminous constructions can b substituted at places where uncrus ed gravels are abundantly availab Scientifically designed mixtures locally available gravel and coar sand together with bitumen can for stable bituminous surfacings wi satisfactory performance.

Increased application is bei found for techniques worked on the Institute for providing mecha cally stabilized soil subbases f cutting down the conventional designed thickness of hard cru without losing efficiency, construc

Foundation problems at Vizag Port were taken up as Consultancy assignment by CRRI

ing stabilized soil rural roads using locally available soil and soft aggregates, stabilizing fine sands and locally available kankar with bituminous materials for road construction in desert areas and the technique for stabilizing highly clayey black cotton soils with small percentage of lime for road construction purposes.

Successful studies have been conducted to arrive at economical solution for strengthening and rehabilitating the existing thin cement concrete pavements showing signs of distress under the existing load of traffic, by developing techniques of providing suitable flexible and rigid overlays.

The Institute has evolved the asphalt mulch techniques which, in conjunction with other techniques such as drainage etc, is highly effective in checking erosion of hill slopes, one of the major factors responsible for landslides.

For expeditious and economical survey of hidden subsurface road construction materials, air-photo interpretation techniques have been harnessed and air-photo pattern for location of 'Kankar' and gravel have been evolved.

A few techniques in the field of bridge engineering have been evolved although work got started at a much later stage on this subject. A technique of strengthening of old existing bridges by post tensioning has been evolved. Work has also been completed to evolve suitable method of rating of masonry arch bridges constructed some 50 to 150 years back, and on the technique of repairing failed expansion joints in bridges.

Utilization of Local Material

Research and Development work has been carried out on two materials namely, burnt clay puzzolana and lime-puzzolana mixture; the former can be used as partial replacement of cement to the extent of 20-25 per cent in all cement based constructions, and the latter is a strength-based economical substitute for cement in certain categories of civil engineering works like pavement bases, masonry, mortars etc. Processes have been developed to improve the properties of low-temperature tars to be used as a road binder, and to improve the quality of bitumens produced from indigenous crudes. Other products developed are bitumastic jointing composition, pitch mastic composition and treated styrene pitch, and jet oil spillage resistance joint sealing composition.

Due to increase in overall development programmes and the spurt in construction activity in the country, the known sources of good stone, which is the basic material for road construction, are depleting. At places, good stone is not locally available and importing it from long distances becomes a costly proposition. Hence, it becomes a necessity to explore the possibilities of utilizing locally available materials for road construction purposes. Studies on some low-grade materials like 'Kankar', moorum, laterites, etc. available all over the country and generally rejected as good road construction materials, have shown that most of these inferior materials can successfully replace to varying extent, the more expensive stone or brick in road construction, either as such or in conjunction with other materials such as lime, cement, bitumen etc.

Successful uses of industrial waste materials such as fly-ash and blast furnace slag have also been evolved in road construction works.

New Tools

Major portions of road construction jobs are carried out manually because of abundantly available cheap manpower and due to limited availability of machinery. Hence, simple devices in the form of manual aids are to be made available for quality output and as relief from drudgery to the workers. A range of devices intended to measure the riding quality of road surrface have been developed with totally indigeneous content. These devices help in effective and convenient control of riding quality of surfaces both at the time of construction and future service. The devices developed are (i) Unevenness Indicator, (ii) Profilograph, and (iii) Automatic Road Unevenness Recorder. Licences for commercial manufacture of these devices have been issued to ascertain firms by the NRDC and the first two are in actual production. Some of the other devices developed, mostly for testing purposes are the Fatigue Testing Machine (patented and in production) for testing resistance of concrete and other construction materials against flexural repetitive fatigue; Covermeter to determine the thickness of clear cover and location of steel in R.C.C. member (Bridges) without making incision into the concrete; Nuclear Surface and Depth Density Probes to be used in non-destructive methods of measuring density; Tilt Meter and Crack Width Gauge for observations of tilt and cracking on various structures.

The Institute, in association with MERADO, Poona has developed Rotillor which can be used in road construction for intimate mixing of stabilizers with soils, and also for agricultural purposes such as seed bed preparation, mining of fertilizers etc.

Traffic and Transportation Studies

With the rapid urbanization and the consequent phenomenal increase of traffic on urban roads especially in metropolitan cities leading to traffic congestion, bottlenecks and hazards, the Institute was called upon to conduct comprehensive traffic and transportation studies of the major towns of Bangalore, Delhi, etc. The studies for Bangalore, and Delhi primarily aiming at an integrated development of transporation facilities and for ensuring economy and safety in transportation have been completed. The investigations have also led to the development of special solutions for the geometric design and traffic operation measures and of new safety techniques.

The Institute also conducted studies to plan the traffic and the road system in the industrial townships of Bhilai Steel Plant in Bhilai, Heavy Engineering Corporation of India in Nangal. A methodology was evolved to work out road widths in all these townships which have more or less similar traffic conditions A general methodology for working out road widths for towns having traffic conditions different from these towns has also been suggested

The Institute has also finalised uniform standards of road signs to be used all over the country.

The Institute is associated with various technical Committees of the Indian Roads Congress and the Indian Standards Institution for formulating standards, specifications and codes of practice for the changing needs and technologies The Institute undertakes, in cooperation with the State PWDs and others, experimental constructions for improvement of existing procedures for design and construction.

Consultancy

The Institute's expert consultancy services are being made use of by most of the highway construction and allied organisations functioning in the country such as, the Roads

Wings, the Border Roads Organisation, Engineer-in-Chief's Branch of the Ministry of Defence, the Central and State P.W.D.s., Municipal Corporations etc. for the solution of the complex and varied problems confronted by them

Some major noteworthy areas in which consultancy services were provided were: foundation engineering problems in Vizag, Kandla and Mangalore ports; reclamation projects of the Mormugao, Goa and Madras Harbour Port Trusts; landslide analysis and correction in far flung Himalayan regions and other hilly areas of J&K, Assam, NEFA and Uttar Pradesh; problems related to 'Sinking of Simla' to recommend preventive measures; design of air field pavements and strengthening of runways to accommodate latest heavy jet planes, investigations on road failures and strengthening or repair of pavements in different parts of the country; design of road pavements in problematic areas; assistance in the construction of stabilized soil roads and other type of cheap all weather roads, utilizing local material, in different States; problems of road construction in snow bound areas; investigations for improving road geometrics in many urban areas; traffic and transportation studies for Greater Calcutta, Bangalore, Delhi, Greater Bombay and Simla In addition, the Institute assists various road departments in establishing their own laboratories. This assistance is towards identification of needs of equipment, staff and infrastructure and in providing training to the staff

Technical Appraisal of Rural Roads

The Institute is actively collaborating in the concerted efforts being made by the CSIR and other agencies in the country towards integrated application of science and technology for all round development of rural parts of the country The endeavour is to start the development at district level by effecting improvements in various sectors such as industry, roads, health, housing, agriculture etc. in the district selected for development. The Institute is playing the role of co-ordination for the Civil Engineering Sector which includes roads, public health, housing and structures. Work in the Karimnagar district of Andhra Pradesh has already been started and is in progress.

The Institute also embarked upon the task of technical appraisal of the rural roads already constructed in the different districts of the country under the Crash Scheme for Rural Employment of the Department of Community Development, Ministry of Agriculture, Government of India. Field surveys were conducted by the Institute's teams in the various zones in which the country was divided for the purpose of this study, and as a result of these surveys, certain suggestions and recommendations particularly covering planning and phasing of road development projects, construction aspects of road, scientific quality control and supervision, maintenance aspects etc. were made.

Dissemination of results of research emanating from the Institute is beng done through different media The effort is to disseminate the information in such a wide dimension that it gets within the reach of all those interested in it. One of such media employed is the organisation of refresher/training courses by this Institute.

The Institute is regularly organising, since 1962, refresher courses to acquaint the in-service highway engineers with the latest developments in highway engineering research and techniques.

Currently one Referesher Course for Senior Highway of 16 day's duration and one for Junior Highway Engineers of 4 months' duration are being conducted per year. Mostly the nominees from Border Roads Organisation, Engineering-in-Chief's Branch, the Central and State P.W.D.s, Municipal Corporation etc. attend these courses. Over 800 engineers have been trained in these refresher courses so far The Institute was also selected by an expert team set up by the United Nations Development Programme, as a Centre for conducting Refresher Course Seminars for Highway Engineers from ECAFE region countries. Consequently, the Institute organised five refresrher courses during the last decade in which 84 highway engineers from India and other South East Asian countries such as Afghanistan, Indonesia, Laos, Nepal, Philipines, Singapore, Thailand, and Vietnam participated.

Another training course in Traffic Engineering and Urban Transportation Planning of two months' duration is being conducted for the last few years which is primarily meant to acquaint the town planners and municipal engineers with the developments in Traffic Engineering research and safety aspects.

To assist the States, whenever needed, the Institute has been organising workshops/extension lectures for the benefit of inservice highway engineers, particularly of the ranks of overseers and junior engineers for whom there is no built-in facility to keep themselves abreast with the latest know-how in the field of highway engineering. A few thousand have been trained in these workshops so far. Most of the work of CRRI is published through the Indian Roads Congress and the publications are distributed free to engineers in the country and on exchange basis to foreign organisations.

The Institute also provides training facilities for the nominees of user organisations, in research methodology or in specific research projects, on request.

Coals, Oils & Papers

(*Contd. from Page* 68)

drugs and dyestuffs. These include diketene and diketene based chemicals, methyl isocyanate, trimethyl phosphite and phthalic anhydride.

Process conditions will be worked out for making silicon carbide heating elements which are essential in the construction of furnaces to generate temperatures above 1400°C.

Work will be done on development of newer types of surface coating materials like microvoid coatings, resins, lacquers and paints from 3-pentadecylphenol obtained from cashewnut shell liquid and new primers like zinc phosphate.

With the help of the prototype coal gasification plant which is under erection, the following studies will be undertaken: (i) Gasification characteristics of different types of coals, (ii) Process development studies for making industrial fuel gas, low Btu gas for power generation, town gas and synthesis gas for production of chemicals, (iii) Collection of scale-up data for design of large-scale commercial plants. In view of the limited known resources of petroleum in India, complete gasification of coal is extremely important both as a source of energy as well as for the production of chemicals and fertilizers.

A number of commercial low temperature carbonization plants are going to be set up in the coming years Large quantities of char fines will be produced in these plants and it is necessary to provide proper outlet for the fines. Conditions will be worked out for conversion of the char fines to smokeless briquettes which can be used as domestic fuel. □

SAFER TRAVEL—2

Automotive Research

THE AUTOMOTIVE Research Association of India (ARAI) Pune, has been approved by the Union Ministry of Industry, to establish testing and research facilities for the automotive and anciliary industries with assistance from the United Nations Development Programme (UNDP) ARAI, set up in 1975, has installed and commissioned equipment for complete chemical analysis of metals and alloys and for physical and mechanical tests such as tension, compression, bend, shear, impact, hardness cupping test (for sheet material). The instruments for analysis include quick and precision instruments like electroanalyser, potentiometric titrator, spectrophotometer and polarograph. There are instruments for determination of hardness of rubbers and plastics, for detection and determination of depth, in coated surfaces with specialised equipment which includes elcometer. In addition, a complete range of equipment for carrying out tests on fuel, lubricating oils and grease and a magnetic flaw detector have been commissioned. Facilities exist for precision macro-examination with a sophisticated stereomicroscope.

The Metrology laboratory is equipped with high precision instruments mostly of imported origin. The equipment in this laboratory includes, measuring projector with a maximum magnification of 100, a coordinate measuring facility, double image system for centre distance measurement and a special screen for comparison of the profile of the component with the tracing besides universal measuring microscope, which can measure almost any type of dimensions in two planes, both internal with the provision of a photographic attchment and a number of accessories, to check the profiles of threads and gear profiles. The camshaft tester can measure the profiles not only of the camshafts being meanufactured in the country, but also the profile of any component.

Other instruments in the laboratory includes those for conventional precision measuring of internal and external features of any component.

The environmental laboratory has been equipped with chambers to create different conditions under which various components are required to be tested to ascertain their functional characteristics under different environs and also reliability. The chambers that are already commissioned are dry heat chamber, up to 300°C, cold chamber for sub-zero conditions up to minus 55°C, damp heat chamber, salt mist chamber for accelerated test for corrosion and mould growth chamber to assess the growth and sustainability of mould in sealed components. A dust chamber and a vibrating table system are under procurement. Facilities for impact and drop testing have been planned for. The engine testing laboratory has been established for carrying out performance and life test on all automative and industrial I.C. engines. For this purpose, three dynamometers have already been commissioned and tests on engines up to 150 HP capacity, both compression ignition and spark ignition could be undertaken This laboratory has been recognised by ISI, for testing automotive, industrial and agricultural engines, for their certification marking programme. Another dynamometer, for testing low speed stationary diesel engines is under commissioning. Three or more sophisticated dynamometers capable of testing engines up to 350 HP, engine analyser, pressure-volume diagram recorder and exhaust gas analyser are expected to be received in the near future, under the UNDR Project.

The vehicle testing laboratory is equipped with a precision fuel consumption meter, which can be used also on board the vehicle. An on the road brake tester and pedal pressure gauge are under shipment.

The instrumentation laboratory is equipped with precision transducers for stress, strain, pressure, displacement linear and angular acceleration, angular velocity, temperature amplifying and indicating instruments, X AY recorder and oscilloscope. A multi-channel utlra violet recorder, load cells, torgue and angular displacement transducers, digital indicators, and a programmable calculator with printer are under shipment. Many more diverse range of transducers are also under procurement. Besides these conventional electronic instruments like digital volt and ammeters have been procured.

In the automotive engineering field, the components and aggregates are required to be tested for life expectancy in specially designed test rigs and their behavioural pattern assessed in simulated conditions as obtainable in service. For this purpose several test rigs have already been installed and ARAI can undertake performance and endurance test in accordance with the applicable Indian and other national standards, of air and fuel fitters shock absorber (for endurance only) horns and horn relay, oil pressure switches, frictional material, like brake and clutch liners, crash helmet and horn switches. An experimental shop has been developed to provide facilities for fabrication of prototype and also manufacture of various test rigs.

The important projects completed by ARAI are development o engines and chassis for an autocycle rickshaw and improved design of a side car for a two wheeler, providing adequate rider comfort. The projects on hand are, development of a power tiller, rationalised design of a diesel engine and development of a crankshaft on S.G. iron. □

Aeronautical Studies

AERONAUTICAL INDUSTRY is one of the most sophisticated techology based activity known to mankind. Revolutionary changes have been taking place in this industry every 10 years or so. Experience so far obtained elsewhere in the world shows that because this industry is closely related to defence, the rate of obsolescence in this area is much faster than in any other industry and hence its dependence on research and development is much more than in any other industry. In view of the strategic importance of R&D in aeronautics to this country, way back in 1957, the Council of Scientific and Industrial Research recommended the establishment of a National Laboratory for R & D in Aeronautics and the Governing Body of CSIR endorsed the proposal. Thus the National Aeronautical Laboratory came into being in the year 1959.

The primary objective of the Laboratory is the scientific investigation of the problems of flight with a view to their practicali application to the design and construction of flight vehicles. Emphasis is laid on the deliberate and planned growth of disciplines that are relevant to the flight vehicle development in order that the Laboratory may offer full back up research and development capability and facilities for the prototype development of such vehicles.

Current Activities

The R & D work of the Laboratory is organised into seven disciplines viz. Aerodynamics, Propulsion, Materials Science, Structural Sciences, Instrumentation, Electronics and Mathematical Sciences.

In the field of Aerodynamics the Laboratory offers full research and development support to designers of aerospace vehicles and assists in wind tunnel testing of scale models of various aircraft, missiles, launch vehicles, etc. The R & D activities are directed to meet the immediate needs of the aerospace organisations as well as national requirements in the foreseeable future. Currently, the activities are: facility development and operation, aircraft aerodynamics, separated and turbulent flows and wind energy.

In the area of propulsion, the activities at present are being carried out in four disciplines viz. Cascade flows, aerodynamics of turbo machinery stages, combustion and gas dynamics and mechanical aspects of turbomachines.

Growth of aeronautical and space activities have been intimately related to better understanding of the existing materials and development of new materials. In this field the Laboratory is carrying out analyses of the existing materials, exploratory and advanced developments related to new materials, their analyses and novel fabrication processes. Current activities are: fatigue and fracture studies, materials testing and failure analysis, unconventional fabrication tehniques, technology of composite materials, preparation and evaluation of materials, and development of high temperature alloys.

The Laboratory's interest in Structural Sciences is to conduct investigations that would advance the basic knowdlege of aircraft structures for use in the design and construction of aircraft, helicopters and missile[s]. The major research programme[s] are currently being confined in th[e] areas of Vibration and aeroelasti[-]city, structural mechanics, com[-]puter oriented structural analysi[s] and composite structures.

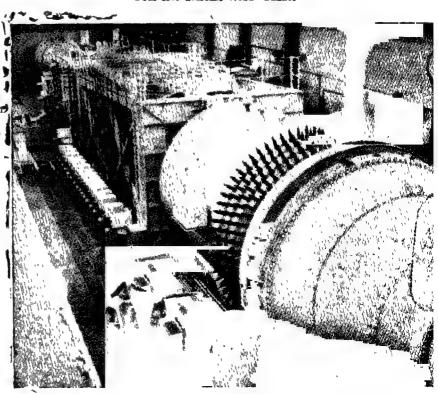
Development of transducer tech[-]nology for the measurement o[f] aeronautical and mechanical para[-]meters and digital electronics fo[r] data acquisition and control, an[d] power electronics are the interes[t] of the Laboratory in the field o[f] Electronics and Instrumentation. Th[e] Laboratory has built up competenc[e] in microprocessor based system[s] for industr'al/research application[s].

The Laboratory is actively engag[-]ed in the development of real tim[e] computer controlled aeronautica[l] test systems, and conducts investi[-]gations on man-vehicle interaction.

Achievements

When the Laboratory was estab[-]lished in the year 1959, there wa[s] hardly any capability in the countr[y] for providing R & D support to th[e] Aircraft Industry which has been i[n] existence for nearly two decades.

The very first task taken up by th[e] Laboratory was to establish a win[d] tunnel complex for the generatio[n] of aerodynamic design data fo[r] flight vehicles. In the absence o[f] such facilities, the country's aircra[ft] testing work was being done i[n] foreign wind tunnels at exhorbita[nt]

Four feet Trisonic Wind Tunnel


costs, inordinate delays and risk to nation's secrets. With the commissioning of the 4-ft x 4-ft trisonic wind tunnel in 1968, more than 6500 test runs have been made on various models of flight vehicles being designed in the country. It is estimated that as a result of this activity a saving in foreign exchange of the order of Rs. 400 lakhs has been affected. In view of the importance of the wind tunnel facility to aerospace programmes, this facility is being treated as a national facility and is being used by the aircraft industry, defence establishments and space organisation on shared cost, shared time basis Through this source, the Laboratory's annual receipts are of the order of Rs 30 lakhs.

With the capability generated in NAL over the years, the Laboratory is in a position to significantly contribute in the area of R & D for airframe of advanced technology aircraft for defence NAL has participated in a number of national programmes for design and development of flight vehicles Typically among these are: development of advanced technology aircraft, modifications to fighter aircraft, development of helicopters, launch vehicles and satellites, etc. NAL also played a significant role in the AVRO Evaluation Committee as part of the analysis group for the Chairman.

Metal fatigue is a major problem in the aircraft industry. NAL has established its credentials in evaluation of fatigue life of aircraft. The capability has been demonstrated in testing of a fighter aircraft and the results so obtained have been of tremendous significance in the development of another fighter aircraft. The monetary saving to the National exchequer based on this programme is estimated to be of the order of Rs. 2,400 lakhs, during the active life of these aircrafts, which is nearly twice the total capital investment of the Laboratory.

The important milestones in aircraft design have invariably been preceded by the availability of newer and more exotic materials. In view of this, efforts have been concentrated by this Laboratory in the technology of fibre reinforced plastic which has many attractive possibilities of application in aerospace structures. Over the years NAL has developed a variety of FRP components and structures. These include piston rings for the Navy, circuit breaker components for the electrical industry, antennae and transportable shelters and radomes for Defence, etc. The technology of radomes developed at NAL appears to have export possibility which is valued at Rs. 100 lakhs during the next few years.

Failure Analysis

Failure analysis is another important problem being successfully tackled by the Laboratory. The expertise grown in the Laboratory has been applied for conducting failure analysis investigations on cases referred to the Laboratory by several organisations. Investigation into the failure of a helicopter structure, analysis of the fracture of wing root attachment of an aircraft, failure of engine thrust bolt brackets etc are some of typical investigations carried out by the Laboratory

For the rapid production of turbine blades and precision forming of complex shaped components used extensively in the aeronautical industry, high precision machining techniques are required. realising the needs of aeronautical and space organisations for advanced technologies not available in the country, the Laboratory has developed various unconventional machines such as spark erosion machine, electro-chemical milling machine, etc Besides aeronautical industry, the machines have wide applications in automobiles, railways and machine tool industry

During the last decade and a half, the laboratory has put the design of instruments for engineering measurement on solid foundation by fully developing transducer technology. Various instruments and devices such as pressure and displacement transducers with associated amplifiers, vibration pick ups, vibration meters and generators, strain gauges, strain measuring bridges, load calls and indicators, multi-channel pressure scanners, etc. have been developed. The transducer pilot plant has supplied these items to many organisations worth over Rs. 26 lakhs. The knowhow on some of these instruments and devices has been licensed to Industry for commercial production.

In aeronautics, measurement of a large number of parameters like those on aircraft structures strains and wind tunnel testing require automatic data recording systems The Laboratory has designed and developed 100,200 and 500 channel data loging systems, radio reporting ring gauges, semiconductor powera controllers, etc. not only for use in aeronautical research establishments but also in other organisations such as railways, other National Laboratories.

Electronic equipment and systems worth nearly Rs. 40 lakhs have been supplied by Electronics Pilot Plant.

Besides the inhouse research and development programmes, the Laboratory undertakes contractual R & D programmes sponsored by aerospace, defence, public and private sector undertakings.

In the aircraft aerodynamics, the Laboratory has taken a number of projects which include computer aided aircraft design, supercritical aerofoils, air intakes, transonic wing aerodynamics, etc. In the discipline of unsteady aerodynamics, the problem areas are in regard to dynamic stability and flutter and helicopter rotor aerodynamics

In the field of wind energy, designing and developing of various types of windmills is underway. This extends all the way from small windmills to charge the batteries in remote locations such as sea buoys, distant radio reporting rain gauges to windmills for water pumping purposes and windmills for generation of sizeable amount of power which may be fed into the grids.

As a sequel to the successful completion of fatigue programme on one of the aircrafts, the Laboratory has been entrusted with the responsibility of fatigue life evaluation of another aircraft in use by Defence

Development of a modern sophisticated computerised full scale fatigue testing facility for carrying out "Close Simulation" fatigue tests on airframes has been taken up This will be operated as a national facility for fatigue life evaluation programmes on future front line advanced fighter airfrafts

Design of a 750 Amps industrial type electro chemical milling machine for making stainless steel nozzle rings used in diesel locomotives has been taken up

A project funded by UNDP for the development and evaluation of high modulus fibre and ceramic fibre composites at a cost of Rs 17.19 lakhs has been taken up Another project for the establishment of Turbomachinery and Combustion Laboratory with the assistance of UNDP is also in progress

Development of newer techniques of structural analysis and synthesis with a view to apply these to practical problems of interest to aerospace organisations are the other activities envisaged in the current programme □

Food Technology

THOUGH MODERN agricultural technology has resulted in augmenting our food production, yet the benefit of this increase cannot be fully reaped unless efficient and effective methods of conservation, preservation and processing are increasingly adopted to curtail the post-harvest damage to food. Also there is a need to tap hitherto unutilised resources of potentially nutritious foods to meet the ever-increasing demand All this would require the generation and use of suitable technologies in all facets of production i e. harvesting, storage, milling, processing, marketing and distribution. For this purpose the Central Food Technological Research Institute (CFTRI) was establised at Mysore on October 21, 1950, as one in the chain of national laboratories under the umbrella of Council of Scientific and Industrial Research.

The primary objectives of CFTRI are to develop relevant technologies for post-harvest conservation, preservation and processing, develop nutritious food products from indigenous raw materials, and assist the new entrepreneurs and the food industry in launching new ventures, in expansion or diversification, and in solving day-to-day problems of production and quality control Besides the main laboratory complex at Mysore, the Institute has seven regional field stations, located at Trivandrum, Mangalore, Hyderabad, Nagpur, Bombay, Lucknow and Ludhiana to solve regional problems, to feed back information needed to identify problem areas and also to serve as extension centres.

Research and development activities of CFTRI during thelast 26 years have led to the development of about 135 processes, products, techniques and equipment designs, which have been released for commercial exploitation to nearly 455 firms.

The Institute's several contributions and achievements during the last 26 years have created an effective base for the development of agro-based industries, and have earned for it international recognition as a premier research institute in the tropics.

Conservation of foodgrains, which constitutes 80 per cent of an average Indian diet, has received high priority. The CFTRI is engaged in developing improved methods to protect the nation's foodgrains by minimising the losses during storage. Since nearly 70 to 75 per cent of the foodgrains are stored and used in rural areas, where storage losses are the highest, concentrated research effort is directed to improve rural storage structures and devise new control methods for application in rural areas. Several techniques have been devised for application in different situations, including fumigation processes to destroy insect infestation, both in bulk storages as well as small scale storages; pest proofing of stacked and stored foodgrains by suitable emulsions that prevent insect attack, and rodent control measures The fumigation process for protecting commercial stock of foodgrains is being used by nearly 30 per cent control firms and organizations The pest-proofing process is being used by several agricultural marketing agencies to conserve the quality of stored foodgrains. The application of these techniques by pest control firms and organisations is helping to drastically cut down the nation's food losses Different types of small scale rural storage structures, made of clay, plywood, plastic enforcement, metal and RCC are being evolved by the Institutute in collaboration with some of the other national laboratories.

Inexpensive fumigant tablets ampoules and discs have been deve loped to disinfect cereals, pulse and seeds stored in small quantitie They are ideal for use in small scal household storages in both urba and rural areas.

A new line of research is the deve lopment of techniques to destro stored food pests without harmfu effects on men or environment. Non chemical protectants like speciall treated clay and tricalcium phos phate, now being tried out, come i this category. Recent large scal trials abroad have proved that mille grain, flours and enriched food can be protected against insects fo several months by adding prescribe amounts of calcium.

New Milling Methods

Another area in which major re search thrust has been made is th processing of foodgrains. Since ric is our major foodgrain, it has re ceived special emphasis. One of th important tasks is to increase th supply of rice by improving the mil ing efficiency, to preserve the nutr tional quality of rice, and to recove various byproducts for econom use New and economical desig are being developed to increase th efficiency and reduce the cost c machinery and equipment. Based o CFTRI's studies on various typ of traditional rice mills and moder technologies available, a systemat programme for raising technolog cal status of the traditional rice mil is being implemented by the Go vernment

The Analytical Quality Control Laboratory of CFTRI provides testing facilities for examining individual food items

Recently, the CTTRI has designed a minirice mill to suit village needs, as a substitute for the widely used inefficient huller mills. The mini rice mill has a capacity of 500 kg of paddy per hour,gives higher yield than conventional huller mills and the same percent age of yield as a modern rice mill. Its cost may not exceed Rs. 30,000 to Rs. 35,000.

About 50 per cent of the paddy produced in the country is processed into parboiled rice to meet the demand of a large section of the people in Bengal, Orissa and Kerala and certain other parts of South India. Conventional parboiling techniques are time-consuming, and the parboiled rice suffers from discoloration and disflavour due to prolonged steeping in cold water. These defects have been overcome by CFTRI's improved parboiling process which is being used by about 500 rice mills. This improved process cuts the processing time from two or three days to about four hours, and offers the consumer parboiled rice of a very high quality, free from bad odour.

It is a common knowledge that housewives generally prefer aged rice than new rice which when cooked becomes a pasty mess. To impart qualities of old rice to the new, the CFTRI has developed a simple steaming method, and this has been adopted by a number of rice millers in Karnataka

Production of foodgrade oil from the rice bran, available as a byproduct from rice mills offers a substantial way to increase the food oil supply. But to obtain a good quality oil, the rancidity that develops fast in the bran after its removal from rice, must be prevented This has now been made possible by the technology developed by the Institutute to stabilise the bran An equipment devised for this purpose costs about Rs. 15,000/- and is proposed to be installed in a number of rice mills. Fabrication of the equipment can be undertaken by small scale industries. Even if 50 per cent of the estimated 20 lakh tonnes of rice bran available from rice mills is used for extraction, nearly 1,30,000 tonnes of edible grade oil can be obtained. The Food Corporation of India is considering to promote the production of edible rice bran oil in the country.

Better Utilisation of Millets

Millet grains like maize, sorghum, bajra and ragi constitute about one-fourth of the total foodgrains produced in India, and from the staple food for large sections of our population; yet they are generally regarded as inferior or 'coarse' grains, and are not commercially processed or universally accepted. The CFTRI has developed technology for processing these grains with a view to rendering them suitable for more widespread and diversified uses as foods.

The processed grains can also be used as basis for making nutritious and snack foods Polished maize, jowar or bajra can be used as a substitute for rice for making several traditional dishes with better consumer acceptance. Properly processed maize *suji* can become popular as a substitute for rice *suji* for preparing *idlis*, or for wheat *suji* for preparing *uppumav*, sweet *bhati*, etc.

In order to increase its suitability as a commercial product, the maize will have to be dehusked and dezermed. For this purpose, CFTRI has developed a mini-maize mill with a capacity of half a tonne maize per hour, and it can be set up in rural areas and small towns with an investment of about Rs. 1,25,000. The Institute is assisting in setting up several maize milling units, including the one recently set up by the Tamil Nadu Agro-Industries Corporation, in Madras.

Modern Dal Mill

Another important gain achieved in milling efficiency relates to processing of pulses which are an important protein source for people dependent on cereal diet. About 75 per cent of the pulses produced in the country are used as *dal*, after milling The Institute has simplified and improved the traditional milling technology and developed a modern dal mill to cut down the processing time and to give higher milling yields

Processing of wheat and utilization of its byproducts are also receiving important attention. The processing suitability of the high yielding varieties is being assessed so as to assist the milling industry to choose the right raw material. A simple milling process is under development for preparation of different grades of flours and semolina for use in small bakeries and households. The use of suitably processed non-wheat flours in bakery products is also being explored with a view to exploiting locally available cereals and millets in areas where wheat is not grown.

The losses of fruits and vegetables between the farm and kitchen, a considered to be heavy because their susceptibility to decay, dama due to rough handling, and deteri rative changes in composition. F achieving fuller use of fruits an vegetables that are produced, t CFTRI is engaged in developi techniques for cutting down deteri ration and spoilage of these high perishable products through ne and better methods of packing, pr cessing, handling and storage. A propriate low temperature conc tions have been established und which different varieties of fru and vegetables can be stored witho much loss in quality, thereby im roving their marketability in dif rent parts of the country.

Refrigeration is an effective to for preventing spoilage, but for lo distance transportation or mark ing under the climatic conditio obtaining in India, it is not cons dered economical, and most of t traders cannot afford it. Studies designing other suitable metho therefore, assume significance. P packaging, application of pla growth regulators before or aft harvest, and skin coating of certa varieties of fruits by a wax emulsi are among the methods that ha been developed to reduce po harvest spoilage.

With the Institute's technical ass tance in wax coating and packagin "loose jacket" variety of orang grown in Coorg were shipped w hout refrigeration to foreign cou ries. The cartons used for pack these oranges were also designed CFTRI. In view of these successf shipments, the Karnataka Gover ment is understood to be explori the possibility of exporting Coo oranges to Southeast Asia.

Fruit Products

The CFTRI's technical servic have also made it possible for Indi bananas to be shipped long distanc to overseas markets with minimu spoilage, resulting in higher acce tance. For this,conditions have be standardised for detecting the co rect stage of maturity of banana and their harvesting, handling, trea ing, packing, transportation an storage. Fungal damage is preven ed by smearing an anti-fungal past formulated by the Institute, over t cut portions of banana bunches an hands.

Scientists are studying ways develop new improved uses for far products, and have established exc ing new possibilities for several v rieties of seasonal surplus frui

Factory produced delicious convenient products like clarified fruit juices and beverages, juice powders, semi-dried fruit pulp, fruited cerea flakes and dehydrated products, based on CFTRI know-how, have provided new outlets for seasonal fruits. The clarified juices which retain the aroma and flavour of the original fruit, and in which no sugar or water is added, are being manufactured and marketed by a firm in Mysore. An integrated process for extraction of pection, peel oil and calcium citrate from lime fruit has been introduced for commercial use by a unit in Maharashtra With large scale manufacture of these products the country will be able to meet its internal demand and possibly capture some share of the export market.

Researches have shown the way to utilise more beneficially after processing regional fruits like grapes and cashow apple, that are available only three to four months a year. The process know-how for the manufacture of fermented beverages like wine and brandy from these fruits has already been commercialised.

Export Products from Spices

Research programmes have given due emphasis on plantation, products like spices, tea and coffee, with a view to helping the export industry to earn higher foreign exchange for the country. The Institute's processing know-how has made it possible to produce and export high quality spice oils and extractives (oleoresins) which are increasingly used by food industries in Western countries, with added economic benefits coming from international trade Their export earnings have been over one crore rupees during the last few years.

Technology has also been developed for processing of ripe pepper berries into white pepper, and also for drying raw green pepper without losing its characteristic flavour and colour. Three firms have started producing dehydrated green pepper for export purposes. Dehydrated green pepper can be used in place of fresh green pepper for garnishing of meat dishes, and is popular in Europe as well as in other Western countries.

Fish, Meat and Poultry

Another area which is receiving increasing attention and new interest is fish, meat and poultry products. Studies are being carried out to improve the techniques of packing, storage and processing of fish and utilisation of inexpensive fish and byproducts economically. Since cured fish has an export market in West Asian countries, scientific methods of salting and sun-drying /mechanical drying have been developed for curing of fish. Commercial utilisation of improved methods for freeze-drying and packing of shrimps and canning of oil sardines developed by the Institute could also help boost exports of these products.

Some of the meat products developed by the Institute are dehyrated mutton mince, cured meat, and comminuted products like sausages, hamburger, salami, and meat loaves.

The Institute is soon to set up a modern training cum-research abattoir.

High Protein Foods

The Institute's work has provided new outlets for poultry products and spurred further development of poultry industry. Using CFTRI know-how, the first egg powder plant was set up near Bombay a few years ago, and the second plant is being established at Karimnagar District of Andhra Pradesh. The Institute's egg coating technique is enabling traders to double the storage life of eggs, thereby cutting down losses due to spoilage.

The CFTRI has pioneered the development of technology for processing and upgrading groundnut cakes, available after the recovery of oil, for use in making a wide array of palatable, nutritious and high protein foods. Several of these products, now coming to the market to meet the nutritional requirements of the vulnerable sections of our population, are the results of researches done at CFTRI. One such product is a weaning food which has been commercially introduced by the Kaira District Cooperative Milk Producers' Union, Anand, under the trade name Bal Amul. Its production during the last few years has been nearly 36,000 tonnes valued at Rs. 2 crores. Another high protein food is Bal Ahar which is extensively used in various child feeding programmes in the country. The production of Bal Ahar has now gone up to 32,000 tonnes. It is understood that the Food Corporation of India, which is the manufacturing agency for Bal Ahar, is likely to raise the production of this high protein food to 40,000 tonnes during the current financial year.

The Institute has won international recognition for development of a protein-rich milk-like drink, based on vegetable protein isolate and milk on 50-50 basis. First introduced for child feeding programmes in Bangalore a few years ago, it is now being produced also at Hyderabad and Cochin under the Food and Nutrition Board of the Government of India.

The first high protein supplementary food developed from groundnut cake flour is the Indian Multipurpose Food and it is now being manufactured by a firm at Mysore and another firm at Kotdwara, Uttar Pradesh.

Another product with a potential for production in various regions of the country for child feeding programmes is an inexpensive, nutritious and ready-to-serve food, called energy food. The main ingredients of this food are: roasted wheat flour, Bengal gram flour, edible groundnut flour and jaggery. About 100 gms of this food provides 16 grams protein and 380 calories. The Institute is producing and supplying 20 tonnes of energy food every month for a feeding programme under the India Population Project being operated by the Karnataka Government in cooperation with the World Bank, at Chitradurga, Karnataka. The Karnataka Government is expected to launch a project for establishment of three units for the manufacture of energy food.

A commercial plant established in Bombay with the Institute process know-how and engineering details has been producing protein isolate of above 90 per cent purety from groundnut for the past nine years. Protein isolate finds use in infant and weaning foods, biscuits and confectionery products, in toning of milk and in ice-creams. The turn-over of this plant during the last few years amounted to nearly Rs. 78 lakhs yearly

Malted beverages, widely used as nutritious food by both the convalescent and healthy people, are mostly based on milk. A malted beverage in which milk is replaced by protein isolate is now being manufactured and marketed by a firm in Madras, using CFTRI know-how

Today lots of more protein-rich products based on different oilseed meals are at the experimental stage.

The first infant food based on buffalo milk was introduced in the Indian market, using CFTRI technology. This product, marketed under the trade name Amul Baby Food, is a household name in the country. This development has made a great impact on the dairy industry

resulting in the stoppage of baby food imports. Cumulative quantum of production of infant food in the country since 1964 has been over one and a half lakh tonnes, valued about Rs. 162 crores.

The rapid urbanization that is taking place in the country has created a growing demand for ready-to-use foods. Several small scale industrial units have sprung up in recent years for manufacture of ready-to-use foods. A variety of convenience foods including dry ready-mix powders for making popular dishes like *idli*, *vadai*, *dosai*, *jamun*, *jilebi*, *chakli* have come to market during the past few years based on CFTRI know-how, and they have reduced long hours of drudgery for the housewife.

Food, Machinery and Packaging

Technological success, quality and standards of the products of agro-industries will depend largely on the use of proper equipment and machinery. Therefore, there is good scope for the development and manufacture of suitable machinery for use by cottage, small and medium scale agro-industries. Several items of processing equipment have been designed by CFTRI, and are being manufactured in the country. They include different types of vacuum concentrators used for milk, malt, coffee, tea and fruit juice concentration; dehydrators for malted foods, vegetables, coconut, cereals, etc ; milling equipment for paddy, maize, and pulses; and precleaning equipment like graders, aspirators, destoners, etc.

Some of the units set up with the engineering assistance of the Institute are: plants for production of protein isolate, baker's yeast, and malted and nutritive beverages, integrated utilisation of citrus fruits, juice concentration, fruits and vegetable processing, spice extraction, whole egg powder, instant mixes, dehydration, etc.

Packaging is vital for protecting and maintaining the quality of food, right from the point of production to the market and beyond. The CFTRI has developed expertise and facilities to assist the industry and other organisations in the design, development, testing, evaluation and quality control of packaging for various foods and food products.

The CFTRI provides a variety of specialised technical services to the existing industry, new entrepreneurs and government agencies, and also offers turn-key technology with guarantees of performance. The technical services comprise everything, from preparing project and feasibility reports to guidance and assistance in selection, installing and trial running of machinery. Analysis, testing and standardisation of processed food products is one of the important services offered to the industry, to food processors, retail traders, and government and semi-government institutions and agencies. An analytical quality control laboratory has been set up to provide testing facilities on payment of scheduled charges laid down for physical, chemical and microbiological examination of individual food products. Several thousand samples of fruit and vegetable products, manufactured in the country are analysed every year to ensure that they conform to the standards laid down by the Fruit Products Order of the Government of India.

CFTRI's well-equipped training and educational facilities meet the needs of food industry and Government agencies. The Institute also serves as an International Training Centre in Food Science & Technology for the countries in South and South-east Asian region. In view of the expertise it has built up over the years CFTRI has been chosen by the United Nations University as an associate institution for practical research and advanced training in post-harvest conservation, preservation and processing of food.

Technical Services

Consultants to a number of manufacturing concerns, cooperatives and Government organizations and agencies, CFTRI in the past few years has completed nearly 50 major consultancy assignments. Currently, about a dozen major assignments are in hand. Besides, on an average between 4,000 and 5,000 minor consultancies are handled by the Institute annually.

The variety of services rendered by CFTRI in the past several years have been instrumental in the establishment of many food industries in the country, introduction of new products in the market, and improvements in the sanitation, increase in nutritional value, enhanced shelf-life and better quality of food products.

The CFTRI is alive to the changing and growing needs of the industry as well as the people, and can be depended upon to face and handle the challenging tasks that may be entrusted to it. The Institute's research and development efforts, are being geared to meet the mounting demand on the country's total food resources. The efforts to conserve what is available for human use and to utilise them even more efficiently, and to exploit untapped food resources, will be continued vigorously. Since there is expected to be an increasing need of not only convenience foods but also foods with high nutritive value, more emphasis is being placed on development of such foods. Processing and storage will have a pivotal role in the food supply system of the future, and as such, development of better techniques of processing, packaging and storage is envisaged. Processed foods like modified starches, modified fats, new protein foods based on locally available raw materials will receive increasing research attention. In keeping with socio-economic changes that are taking place in the country, several of the research and development programmes will be oriented to suit rural needs and application. □

MILK FOR THE POOR

Having increased the country's milk production to 30 million tonnes a day, the dairy science experts are faced with the problem of minimising the cost of its production. The nutritional experts are intrigued over the increased milk yield and decreasing per capita consumption.

The dairy scientists are of the view that one way of minimising the cost of milk production is to popularise among the breeders of milch animals the techniques of enriching dry roughages by adding urea and molasses to wheat straw and paddy straw. The Fodder Research Stations of the various Agricultural Universities in the country have evolved different strains of nutritive grasses suited to varying climatic conditions.

Yojana Quiz

YOJANA QUIZ

1. The total available volume of water flow from India's rivers per year is assessed at
   (a) 2,000,100 million cubic metre.
   (b) 1,683,000 million cubic metre.
   (c) 5,143 000 million cubic metre
2. What is the greatest depth of Indian Ocean?
3. What is the estimated water resources in India?
4. In which games are the terms 'open file' and 'luff' used?
5. What is the distance of the longest race ever recorded in athletic history?
6. What is the route kilometerage of railways in Afghanistan?
7. Philippines consists of how many islands?
8. First Hydro-electric Station set up in India was at
   (a) Mysore
   (b) Srinagar
   (c) Darjeeling
9. What is Ostpolitik policy?
10. What is Autarky?

Answers

1. (b) 1,683,000 million cubic metre per year.
2. Diamantina Trench 26400 ft.
3. India's water resources have been provisionally estimated at 1,35,60 lakh acre-feet.
4. Chess and Sailing
5. New York to Los Angles 5776 km. from March 21 to June 16, 1929
6. There are no railways in Afghanistan. Rough mountains have prevented the building of rail-roads
7. It consists of 7,090 islands.
8. (c) Darjeeling in 1897-98
9. West Germany's policy of rapprochement with Communist East Europe.
10. The idea that a country should produce everything it requires and cut down foreign imported goods. It gained considerable impetus after the World War I

Quotation Box

Each one (Freedom Fighters) fought because he felt that it was better to fight and die rather than live in slavery. How does this call for a reward ?

After having given their best to the family and through the family to the society, the aged are entitled to respect in the evening of their life.
—Morarji Desai

There is hardly an association in which politicians and others with vested interests have not hogged important posts for years and misused their enormous powers of patronage.
—Editorial in The Times of India

The Commonwealth is one of the best obnoxious organisations in the world.
—New Statesman

The political executive must pull up the bureaucracy where it is sluggish but it should create an atmosphere in which officials feel that zeal, initiative and hard work are prized and do not land them in the lapse of inquiry commissions.
—Nandini Satpathy.

Those young hands applauding us now may manufacture the bombs that will kill us if we too do not change our ways of living and leadership.
—R. Premadasa
Deputy leader, Sri Lanka United National Party.

Towards Safety and Efficiency in Mines

S. BAGCHI

INCREASED SAFETY and improved technology have long been the concern of the mining industry in all parts of the world. Mining Industry is three hundred years old. The Central Mining Research Station (CMRS) at Dhanbad, a National Laboratory under the Council of Scientific & Industrial Research was set up in the fifties.

As the country's primary research organisation on mining, the institute works to solve various problems to make mine safe and productive through systematic investigation and to develop import substitutes. The programmes envisage advancing mining technology for more efficient and higher recovery of fuel and mineral resources, improving mining conditions to protect the health and safety of the miners and ensuring conservation of minerals

The R & D programme has been organised to meet short term and long term needs. The immediate needs of the mining industry are met mostly on sponsored basis Solutions to problems are evolved on the basis of available information, supplemented by observations To meet the long term needs, systematic research is carried out on identified problems.

Branches of Activity

The work of the laboratory may be broadly divided into four segments:

Mine Technology – The programme is designed to make mining technology more productive and efficient consistent with safety

Environmental Control – The programme is to conceive, develop and demonstrate technology to reduce hazards from gases, fires and explosions. Ventilations of mines plays a significant part in this aspect.

Mine Engineering – The programme is structured to design and develop machinery, equipment and instrument for the mining industry. Development of import substitutes is an important aspect of the programme.

Mine Health – The aim is to lower the probability of occupational diseases and to protect miners from exposure to dust, noise, toxic gas, etc

Systematic and scientific observations have been made on different aspects of strata behaviour in the mine workings These observations are now of great help in designing support systems for reorganising old mines and planning new mines

It is now possible to determine the support resistance requirement for longwall faces, define the expected movement at stowed and caved faces, anticipate the occurrence of the first major weight in caved faces and define the efficiency of hydraulic and friction props

An instrument known as convergence indicator has been developed for ascertaining the roof movements The study of roof movement helps in the early prediction of any impending major danger A strata movement alarm which may be used as convergence, yield and roof sag alarm, has also been developed It indicates impending roof fall in mines in advance

Investigations have been carried out to determine the different parameters of surface movements due to underground mining of coal seams It has become possible to anticipate surface movements such as subsidence, slope, strains and angle of draw which have been used for studying the feasibility of extraction of coal seams.

Roof Support

The equivalent material mine modelling technique, developed on the principle of dimensional analysis and theory of modelling, has been perfected. It offers suitable remedial approach for working under river beds, acquifers, built-up structures and mining of thick, flat or inclined seam, specially when cavability of roof rock mass is to be anticipated under varying conditions.

Fall of roof and side wall is the cause of many accidents. The best way to prevent injuries from roof fall is to provide proper roof support. Investigation on such supports has been carried out. Besides strata movement and subsidence problems are also being investigated.

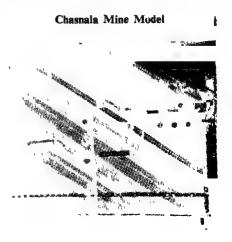
Different types of props (friction prop, hydraulic pit prop, hydro-pneumatic prop) have been developed for better support in mines. Most of the hydraulic props used in mines do not incorporate any device to indicate load coming on the props at any particular moment. The capacity of a prop also cannot be changed without dismantling in most cases. A new type of prop has been developed to meet these efficiences.

Equipment and ancillaries for a complete communication system in mines have been developed and successfully installed in mines. The whole system is technically known as Central despatcher system.

Installation of support system in mines is a costly proposition and it also affects free movement of machinery as well as men in the underground. A new and effective method of support has been perfected which is known as roof bolting. Today in India, roof bolting has been widely accepted A new type of grouted bolt has been developed which is more efficient and economical, compared to conventional bolts Resin bolting technique developed at CMRS is another device which reduces the time of setting. This is an important fact for roof control

Another method of support known as 'roof stitching', making use of old haulage rope, has been developed It is a fast, economical and more effective method of support compared to conventional wooden sup-

Chasnala Mine Model

Shri Bagchi is Director, Central Mining Research Station, Dhanbad.


port.

For coal mining, knowledge of strength properties of coal and rocks is very useful in designing safe and economical excavations and also for various other purposes. For estimating this strength, CMRS has developed a method called the 'compaction strength index test' which is simple and reliable compared to other tests used in the USSR and the UK.

Stowing is an important mining operation which is generally applied for preventing subsidence, conserving mineral, increasing production and avoiding fire. CMRS investigations have helped a number of mine managements increase rates of hydraulic stowing up to 20 per cent.

River sand is a cheap as well as common material for use in hydraulic stowing. But its consumption is increasing fast. The reserves of sand is dwindling CMRS has been investigating the use of various industrial wastes.

Blasting Technologies

More than a decade ago, a quiet revolution in blasting practice started in India and CMRS played a pivotal role by actively contributing towards evaluating the safety of the explosive and developing the technique of blasting

It was in 1961 when the first gallery for testing of permitted explosives was constructed at Central Mining Research Station. This was a great step towards the goal of selfreliance This has enabled the country to stop importing explosives and develop indigenous capacity for producing permitted explosives.

By changing the pattern of drilling and blasting technique in iron ore and copper mines CMRS has helped achieve considerable economy in blasting operation.

Investigation has been carried out to determine the efficiency of the solid blasting in mines For this purpose optimum blasting pattern has been developed The efficiency of different types of explosives has also been determined under various conditions. This will help increase output of mineral and reduce the cost of blasting operation.

The health laboratory has been investigating various occupational health problems of miners. The scientists of the laboratory are engaged in studying the dust condition in mines, the fatigue problems of the miners in relation to the hot and humid conditions in the mines, and the incidence of occupational diseases among miners. CMRS scientists have suggested various measures to reduce the dust hazards.

Prevalence of opthalmic diseases like defective vision, cataract, pterygiul, conjunctivitis, corneal ulcer, glaucoma, nystagmus, squint etc., is being studied. It is found that the percentage of miners having some problems of the eye is 29.06. Twenty-four per cent of the miners have defective vision.

CMRS has developed facilities for testing of material and equipment for mining and other industries. This has become not only helpful in the efficient and safe working in these industries but also instrumental in developing indigenous industries for the manufacture of standard mining equipment which otherwise would have to be imported.

The laboratory is fully equipped and is extending facilities for testing of safety equipment (flame proof, intrincssilly safe and dust tight) personnel protective equipment (helmet, caplamp, goggles etc) wire rope safety hooks distribution plates rope cappels, chains, shackles, pins, tub couplings, safety belts, clivy hooks, safe explosive, exploder, detonator, etc

Future Programme

A much greater effort will be required to make the working environment safe and conducive to better productivity This is where electronic and remote control systems would play a vital role not only in establishing intra-mine communication channels between highly dispersed work sites as is obtainable in mines, but also in the development of monitoring systems to detect potentially dangerous conditions before they reach the critical point, say, due to methane.

The trend towards greater working depth, more extensive mine layout and increased productivity will have its own consequences with an increase in gas and heat emission and a rise in dust levels. Improved techniques must be evolved for their elimination Research in an inherently safe mining system involves the entire gamut of mine climate covering not only these aspects but also spontaneous reaction and mine fire, explosiveness of coal dust detection of poisonous gases etc

Research in the improvement of the working environment with regard to temperature and humidity noise-level and lighting conditions needs greater attention, as do the much promising domains of ergonomics and ergometrics. In addition, it is necessary to determine the dietary and nutritional level of workers.

Therefore, the Central Mining Research Station is planning to develop new techniques of exploitation of minerals, design new ventilation systems and environmental controls, evolve safe parameters to render mining conditions free from hazards of explosion and fires, find explosives for safe and efficient breaking of minerals, as well as new partners of drilling and charging of explosives and investigate the environmental pollution of the mine atmospheres and occupational diseases of minerals and suggest control measures.

Safety and productivity are compatible A safe system is also an efficient and productive system The mission of CMRS is, therefore, to develop safe system which will be productive and economical Nationalisation of coal mines has brought significant changes in the mining industry and has had a profound impact on the activities of CMRS □

Technology evolved by CMRS has gone a long way towards productivity, efficiency and safety of the mines

Fuel Research

THE CENTRAL Fuel Research Institute located at Dhanbad has, besides its central laboratories located at Digwadih, seven coal survey laboratories one each at Dhanbad, Raniganj, Ranchi, Bilaspur, Nagpur, Jorhat and Jammu for covering the various coalfields.

The CFRI undertakes applied and basic research on all aspects of fuel utilization especially coal. The R & D activities of CFRI cover broadly the following seven areas:

1) Resources quality assessment, including geology and petrography of coal.
2) Preparation of coal – covering coal washing, demineralization, briquetting, pelletisation and flocculation studies
3) Technology for direct use of coal – covering combustion, direct reduction using coal and carbon artefacts for electro-thermal and chemical industries.
4) Conversion of coal – including carbonization, gasification, oxidation, hydrogeneration, solvent extraction and degradation techniques.
5) Product improvement and valorisation – comprising rrcovery and purification of chemicals from carbonization products, synthesis of liquid fuels and chemicals from carbonization and gasification product and byproducts, industrial carbons, and utilisation of wastes such as fly ash from power stations, washery sinks, etc.
6) Supporting R & D activities – dealing with basic science relating to nature and use of coal, coal systematics, catalysts and adsorbents, applied statistics, analytical services including instrumental analytical techniques and design and development
7) Supporting technical activities – covering engineering services, technical aid to industry and consultancy, techno economic evaluation of projects and feasibility studies, librang and documentation, reprography, coordination and dissemination services and planning, monitoring and costing of projects.

Significant contributions to have been made by CFRI to national economy through its coal survey programme. Besides identifying nearly 1300 million tonnes of new sources of coking coal, it has been possible to broadly categorise and quantise the different types of Indian coals under the heads 'prime coking', 'medium coking', 'semi to Weakly coking' and 'non-coking coals'.

The task completed so far has covered the rip quality under production and quality and property assessment of the virgin coal resources of about 300 seams encountered in various prospecting blocks. As a result, the following broad categorisation of Indian coals in terms of their reserves has been possible.

(i) Group A – Prime Coking – 5,651 million tonnes
(ii) Group B – Medium Coking – 9,433 million tonnes
(iii) Group C –(a) Semi to Weakly Coking coals – 5,070 million tonnes
(b) Non-coking (incl, tertiary coal and lignite) 62,886 million tonnes.

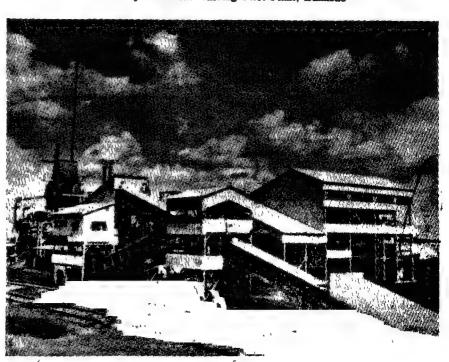
Preparation of Coal

The most challenging task faced by coal industry today is to meet the growing demand for increased supplies of metallurgical coal of specified quality for steel making.

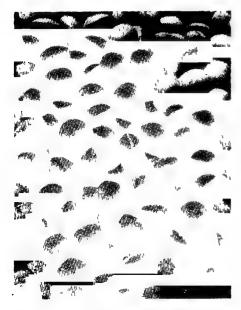
Achievements of CFRI are also reflected in the establishment of industries utilising basic know-how and design parameters provided by the Institute, 14 coal plants, at a cost of about Rs. 700 million, with annual installed capacity of about 26 million tonnes of coal have been established based on detailed design parameters and flow schemes provided by the CFRI. Five more plants with a washing capacity of 10 million tonnes of coal annually are projected for which also CFRI will provide basic data.

CFRI has developed for the first time an index for the comparison and correlation of the washability characteristics of coal, which has been recommended by the National Coal Board, U.K. for being adopted as international standard to classify coal based on their washability characteristics.

Some of the important developments include (i) improvements in the efficiency and capacity of subaeration floation calls by using grids– (ii) an integrated process (oleofloatation) for upgrading and dewatering of small coal and (iii) a process for de-mineralisation of coals by oil agglomeration technique which is perhaps the most remarkable as it enables recovery of clean coal with considerable mineral matter reduction and the low ash coals have

Composite Coal Washing Pilot Plant, Dhanbad


immense potential for use in a wide variety of specialised industries, such as electro-thermal processes, blast furnace, coal hydrogenation (to produce liquid fuels), etc. A demonstration plant of 2 t/h. cap, has been installed at Lodna in the Jharia coalfields.

Several processes for making formed coke from non-coking coal have been developed at CFRI, Formed-coke can be used as domestic, industrial and metallurgical fuels. The process normally requires briquetting, curing and carbonization steps depending on the end uses of the products. A 100 t/day briquetting plant, utilising coke breeze by the CFRI process has virtually gone on stream at Ghaziabad in the private sector though some teething troubles are being experienced. A Formed coke plant of 350 t/day capacity is now in the process of design and installation at Talcher based on CFRI process, at an estimated cost of nearly Rs. 30 million and the processed fuel so produced will be utilised in the manufacture of low phosphorous pig iron. It is anticipated that with the proving of the laboratory findings in the industrial scale, the door will be open for widespread steel industry all over the country, wherever lignite coal and iron ore occur.


Based on CFRI pellet coke process Bharat Coking Coal Ltd. has installed a 100 t/day plant near Kusunda (Jharia coalfield) for commercal production of smokeless domestic fuels from the inferior coking coals, to be sold in the market under the trade-name 'JWALA'.

The main CFRI contribution to the fuel and industrial economy of the country has been the introduction of use of low-grade coals for power generation which, incidentally has also made possible an offtake for the large production (over 30 per cent) of low grade byproduct fuels from washeries. The Institute has entered into a collaborative project with Bharat Heavy Electricals Ltd. and Central Mechanical Engineering Research Institute for developing fluid-bed combustion boiler, a new technology in the offing for power generation.

At the instance of the Ministry of Food & Agriculture, the Institute recently developed a husk-fired 16 kg/hr combustor-cum-heat exchanger for sup plying hot air for paddy drying

Coal Conversion Technology

(a) *Carbonization* : Considerable work has been carried out at CFRI relating to benficiation, selective preparation crushing and judicious blending of different coals, densification of coal charge, preheating, design improvements, etc. These are improved technologies which have contributed to on a rough estimate doubling the available potential of coking blendable coals for steel industry. The selective crushing plant at Durgapur Coke Oven Project was installed on the recommendations of CFRI. Based largely on CFRI work, steel plants and coke ovens in the country have adopted suitable ternary blends of prime, medium and blendable coals for metallurgical coke production.

Another significant achievement is the development of a new design for Beehive Coke Oven Design improvements made by the CFRI in collaboration with Tata Iron & Steel Co., over the conventional beehive ovens have made it possible to produce hard coke (without byproduct recovery) in about a third of the time normally required, thus contributing greatly to the entire economy of the industry. Several hundred such ovens have already come into being.

A prototype design was evolved for low/medium temperature carbonization of variety of semi-coking coals with simultaneous production of rich gas after byproducts recovery. Two commercial size vertical retorts were installed (capacity 20 to 30 t/day) with byproduct re covery units. About 22,600 tonnes of coal from more than 45 different sources in India, have been carbonized so far in this plant. Exploitation licences have been granted to two renowned foreign coke plant manufacturers and the Governmen Engineering Projects India Ltd Considerable interest is now bein shown 'for the adoption of LT(plants for the supply of both domes tic and industrial fuels in large citie like Calcutta, Bombay, Delh Patna, Kanpur, etc. Coal Indi Ltd. has decided to install CFR type LTC plant at Dankuni nea Calcutta, the tests for which with th linked coals were recently conclud ed at CFRI.

(b) *Coal to Oil* : The Institute ha been carrying out investigatior through all the three known route of coal conversion to liquid prc ducts, namely, pyrolosis, direc hydrogenation and Fischer-Tropsc synthesis.

In the pyrolysis route, the oi produced can be catalytically hydr genated to yield middle distillat (diesel, kerosene, etc.). As CFR processes have also been develo ed for hydrotreatment of Assar middle distillates to yield superi grade kerosene and diesel oil Th hydrogenation investigations a CFRI have centerred around th development of catalysts and choic of processing conditions especiall for development of low pressur techniques, with robust catalysts

Direct hydrogenation of coal o solvent extracted coal was achieve with cheap yet efficient throw-awa catalyst based on iron for the 'pro duction of syn-crude, the liquific coal A 18 kg/hr slurry phase hydro genation plant is being set-up Amenability of Assam Coal for th purpose has been established an coals from Raniganj and Singa reni hold promise Considerabl work has been done on the solver extraction of Jharia and Ranigai coals

F T process for the synthesis c hydrocarbons and chemicals re quires synthetic gas which is pro duced by complete gasification o coal with steam and oxygen. By thi process about 5 tonnes of coal yiel a tonne of liquid products of whic 30-40 per cent are energy fuels mor than 30 iron based catalysts usin different carriers and promoter were prepared and tested in benc scale unit. CFRI is now proposin to build a unit to produce abou 5 litres of liquid products per day

(c) *Conversion to Gas* : Two majo pilot plants using two differen techniques for complete gasifica tion of coals were installed at CFR One of the systems viz powder ed coal gasification techique ha been accepted by the Fertilizer Co

(*Contd. on Page* 102)

FUEL RESEARCH

(*Contd from page* 98)

poration of India for making synthetic gas in the first three recent coal-based fertiliser units

A catalyst (till recently imported) for removal of sulphur from gases developed by CFRI is now being extensively used in the country, e.g. for cleaning over 5 million cu. ft of coke oven gas per day for transmission from Durgapur to Calcutta and elsewhere.

Techniques for production of several important chemicals from coal tar, gas and benzol have been developed and when commercialised, large scale import substitution can be achieved. These include phthalic anhydride from crude naphthalene, anthraquinone from anthracene, nicotinic acid from picoline and pyridine from quinoline, naphthaldehydes from methyl naphthalenes, benzoic acid from toluene, o-& p-xylenes from meta-xylene, etc. These are important raw materials and intermediates for paint, dyestuff and pharmaceutical industries.

New techniques have also been developed for isolation and/or recovery of useful chemicals from coal tar as such or their conversion to more useful intermediates and fine chemicals, e g maleic anhydride, benzo-nitriles, phthalonitriles, cresols, beta-naphthol, resorcinal, 3 & 4 cyanopyridines etc.

CFRI has entered into developmental contract with competent consultants for 13 patented processes and have undertaken extensive demonstration runs of the processes for the prospective entrepreneurs The consultants scale up the process and offer turn-key plants and guarantee for successful operation of the know-how.

CFRI has also developed processes for important industrial products like carbon black from anthracene oil and acetylene, electrode carbons from pitch-coke or solvent extracts of coal, special electrodes for aluminium industry, carbon brushes, active carbons from coal, lignite, coconut shell, saw dust etc

The institute has developed a process for the utilisation of fly ash, a waste from thermal power station boilers, for the production of building bricks, blocks, roofing tiles etc the West Bengal Housing Board has set up a demonstration plant with the CFRI know-how for producing 6 000 bricks a day at Asansol

Fundamental investigations at CFRI on coal and on disciplines relating to coal utilisation have received international recognition These studies on techniques of dehydrogenation, pyrolysis, etc have provided knowledge on the state of combination of carbon and hydrogen in the coal molecules and have helped to put forward a structrual model of coal.

Some other activities include forecasting future energy requirements for the country, undertaking sponsored research on behalf of public and private sector organisations, liaison services to cater to the needs of the industries and government establishments, etc

The Institute publishes a quarterly journal, FRI News, and also valuaable monographs on topical subjects and proceedings of symposia organised by it. □

R&D AT VOLTAS
...in pursuit of perfection
Voltas believes in keeping abreast with the times. That is why Voltas has one of the largest R&D establishments in the private sector...attached to its Works at Thane, near Bombay.
At Voltas, R&D is not just a convenient phrase to cloak quality control. It's the big wheel New ideas are given shape and mere thoughts become 'blue-prints' for successful product lines.
Set up in 1971, Voltas' R&D Division has already helped the Company to introduce numerous new products. To improve the quality of existing products. To maximise import substitution. To develop products suited for export markets—for working in snow-covered regions in Russia or in arid conditions of the Gulf.
The products so handled cover air conditioning and refrigeration equipment, mining machinery and materials handling equipment
The credo of R&D at Voltas is simple No product is "perfect". A "perfect" product will not require further research, development or improvement. And, it is difficult to imagine such a product
So, our R&D is in constant pursuit ...in pursuit of perfection!

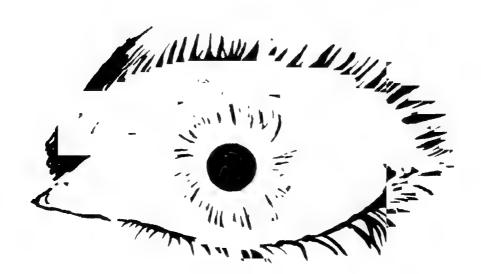
How shall our love console thee
Or assuage thy hapless woe
How shall our grief requite
The hearts that scourge thee
And the hands that smite
Thy beauty with their rods of bitter rage?
Lo ! let our sorrow be thy battle gage
To wreck the terror of the tyrant's might
Who mocks with ribald wrath thy tragic plight
And stains with shame thy radiant heritage.
O beautiful ! O broken ! And betrayed !
O mournful queen ! O martyred Draupadi !
Endure thou still
Unconquered, undismayed
The sacred river of thy stricken blood
shall fold the fivefold stream of freedom's flood
To guard the watch-towers of our Liberty

SAROJINI NAIDU


A POET'S RESPONSE

The disproportionate severity of the punishment inflicted upon the unfortunate peop and the methods of carrying them out, we are convinced, are without parallel in the history of civilised governments, barring some conspicuou exceptions, recent or remote Considering that such treatment has been meted out to a population, disarmed and resourceless, by a pov which has the most terribly efficient organisatior for destruction of human lives, we must strongl assert that it can claim no political expediency, far less moral justification Knowing that ou appeals have been in vain and the passion of vengeance is blinding the noble vision of statesmanship of our government, which could s easily afford to be magnanimous as befitting its physical strength and moral tradition, the very least that I can do for my country is to take all consequences upon myself in giving voice to th protest of the millions of my countrymen, surprised to a dumb anguish of terror The time has come when badges of honour make our shame glaring in the incongruous context of humiliation, and I, for my part, wish to stand shorn of all special distinctions, by the side of those countrymen, who, for their so-called insignificance, are liable to suffer degradation nc fit for human beings

"There is no human institution but has its dangers. The greater the institution the greater the chances of abuse. Democracy is a great institution and therefore, it is liable to be greatly abused. The remedy, therefore, is not avoidance of democracy, but reduction of possibility of abuse to a minimum."

Returning to Gandhi

THE one beneficent result of the Emergency is the opportunity it has given for a basic thinking on what is democracy and how it may be preserved. Though the urban liberal, who has long nurtured the illusion that his benevolence is the equivalent of people's sovereignty, is bound to come out with institutional remedies, the frequent references to Mahatma Gandhi induce a hope that the discussion may be more basic and rewarding.

Disillusionment has already set in among the romanticists who saw in the vote the consummation of the struggle against the despotism of power Tyranny only continues in representative authority. The extension of the voting right is always accompanied by a system of checks with the balance in favour of the ruling class.

Gandhi, more than most people, recognised the naivette of those who were bewitched by franchise-based democracy made inseparable from a structure of immunities, privileges and reservations raised in the name of efficiency, objectivity, national interest, public interest, public safety and security With police power being recognised as the transcending duty of the State, the vote first became incidental to democracy and then a sanctifying instrument of tyranny and elite rule.

Degeneration was built into the "checks and balances" system and into the self-deception that large governments, adequately safeguarded against arbitarary action, can "represent" the people and reflect their will The dividing line was always thin between the populist who could rise to power on national sentiment using the levers of franchise-based democracy and the "democrat" whose faith in the people was always subject to his greater faith in efficient, honest and just government guaranteed by institutionalised concepts. In the bargain the vote did not represent people's sovereignty but was only a passport to elite rule. The continuing oligarchy was tempered to an extent by the inevitable welfare of the technological revolution. With economism becoming the sustenance of the political system, bread and power dulled sensibilities to such an extent that the vote meant nothing, proved nothing and brought nothing.

The vote is only an affirmation of remote oligarchy. Its antithesis is the non-vote, that is government by the people, not *of* or *for* the people. Gandhi instinctively recognised that the vote is only a device to take away from the people their right to govern themselves and confer it on their "representatives" who felt safe in the sanctuary of consumer society. The talk of participatory democracy offends the "intellectual" who immediately speaks of the anarchronism of city states. The "modern" knowledgeably talks of small governments and industrial progress going ill-together. And, for the "modern", progress is inseparable from industrialisation.

Gandhi began from the beginning. The logic of large government being industry wherein he recognised the

basic evil, he said, "My concern is to destroy industrialism at all costs". He equally rejected the welfare idea as the beginning of a mercenary society.

Gandhi's basic objection to industrialism was the oligarchy which it was bound to lead to. But he could not wish away industry nor the welfare concept in an environment of pervasive poverty. Gandhi did not seek to reconcile the contradictions; he was groping all the time and that was part of a timeless striving

It is this inner struggle, this groping which India seems to have lost in the unreality of freedom. Assurance, assertive to an aggressive degree, has robbed our development of the adventure of ideas. We seem to have accepted the eternal virtue of economic emancipation, social transformation and political democracy. Industrialising and planning, modernising and mechanising, voting and legislating, we march on. What seems to have been lost is the revolutionary ethos, the constant struggle of ideas that would transcend even a near perfect schemes of things

Gandhi himself had no ready-made prescription beyond saying that a satyagrahi does not seize power, he revolts against it ultimately and its abuse immediately; and that it is not twenty men in authority but millions in resistance that make a democracy. He spoke of ever-widening, never ascending oceanic circles, where the "outermost circumference will not wield power to crush the inner circle."

Gandhi accepted little and rejected less. If only we can be less sure of things and regain the ability of constant introspection, we would have done all the service to the memory of a fundamental political philosopher. Returning to Gandhi would at least save us from thinking that the big approach obliterates the smaller, that concepts are more important than ideas and that institutions transcend the people. And it will save us from the tyranny of experts preoccupied with the non-sense area of "development".

Building democracy anew may involve a thorough overhauling of the constitution, a renovation of the administration, an attack on urban parasitism, the destruction of the tyranny of "efficiency" and "expertise" and liberation from the hackneyed and artificial shadow-boxing between the "progressives" and the "reactionaries" both of them partners in the blood-sucking process.

The Great Infamy

WRITING on the Dyer debate in the British Parliament, Rabindranath Tagore said, "It shows that no outrage, however monstrous, committed against us by the agents of their government, can arouse feelings of indignation in the hearts of those from whom our governors are chosen. The unashamed condonation of brutality expressed in their speeches and echoed in their newspapers is ugly in its frightfulness".

How true this sounds in the context of some present debates in our country! Despite the relentless unfolding of the gruesome drama of the infamous nineteen months, when, to use the words of the Congress enquiry report on Jallianwala Bagh, "licentious conditions of judicial administration were created" and when there was "organised terror and disorder, martial law without the name", no feelings of indignation seem to have been aroused in the hearts of those who only speak of some excesses of the Emergency without being prepared to own up that the Emergency itself was the greatest excess. A party's greatness, to quote again from Tagore, "can never find its foundation in half-hearted concessions of contemptuous niggardliness".

Tagore wrote in the context of the simultaneous criticism of General Dyer and praise of Sir Michael D' dwyer. There is a strange parallel in some present criticism of the "excesses" and simultaneous justification of the Emergency.

The infamy of the Emergency is not so much in its proclamation as in the atrophy of intelligentsia conscience that it revealed. That this act against the Republic and India's inheritance was done in the name of the Indian National Congress, which, under Mahatma Gandhi, was the symbol of liberty and justice, does not appear adequately to have shocked to their core many of those who still bear the label of that great organisation.

What humiliations have we not endured ! And yet, while unlettered people in remote hamlets were ready to defend their homes, hearths and honour with their lives, the so-called institutions of democracy were paralysed into inaction and became mute witnesses to one of the greatest frauds of recent history. That falsehood could have flourished for nineteen months without any great challenge is a greater infamy than that falsehood was practised. And the partners in the greatest crime against our people, with a dishonest posture of outraged morality, denounce the release of those who had the courage to stand up and fight even by violent means It is an equal tragedy that such release should be defended on any ground other than that the men released were not criminals in any sense of the term but soldiers in the battle against despotism. "I would risk violence a thousand times", said Gandhiji, "rather than risk the emasculation of a whole race". Have we forgotten Gandhiji's words that a citizen who barters with a state that has become lawless or corrupt shares its corruption or lawlessness?

"Fearlessness is the first attribute of spirituality; cowards can never be moral. Where there is fear, there is no religion", said the Mahatma. And yet cowardice is presented as morality to the extent that a resister is paraded as a criminal. And these ignoble men have now summoned up enough courage to defend those who had murder in their hearts and minds and eyes.

THE recent election marks a break with tyranny and all that went with it. In many ways the national scene in 1977 was similar to what it was in 1947. To pretend that it is anything less is to indulge in self-deception. Let no one be apologetic who had any share, violent or non-violent, in resistance to tyranny and in bringing about its end. Let us show the traducers and calumniators to be what they are—partners in a treasonable crime against our country, treasonable in the moral, if not in the legal, sense.

The ordinary people of this land have given us an opportunity to "recollect in tranquility". The Rowlatt Bills had not done one thousandth of what the Emergency did. And yet, at Gandhiji's call, the nation, from end to end, rose against that black bill, with shouts of *na appeal, na dalil, na vakil*. How was it then that a proposed constitutional amendment seeking to im-

munise for all time an individual from legal action for any crime, past, present or future, did not evoke a protest in the country and received near unanimous support from those who claim to be heir to the Indian National Congress of Gandhiji's days? Were not these people themselves emasculated, smothered, stifled and silenced to a "dumb anguish of terror"? How many in the country protested when Parliament was insulated from the people through a rigid censorship of its proceedings ?

LIKE thief in the night, the Emergency robbed this land and its people of its most cherished treasure. In the first few days of this dreaded exercise, people were arrested at random in government offices and at bus stops, chartered buses carrying employees back home were diverted to police stations, houses were raided, and a general atmosphere of terror created, backed by a high powered propaganda of falsehood.

And yet this country appeared to be prostrate to the extent that the Rt. Hon'ble Michael Foot (belonging to a party claiming to be a party of revolt) and the "egregious Baroness of Ashbridge made bold to suggest that the attack on the basis of our existence as a democratic nation had people's backing.

We witnessed the sorry spectacle of the officials and even a Chief Minister keeping silent when they were told by a wise Minister that even *High Courts* have no business to pass *illegal* orders and these orders need not be obeyed. How did the lawyers bring themselves to arguing that a detenue can be starved to death or even be shot while in detention? How did the highest court of law in the country persuade itself to accept the technicality that a citizen of our republic did not have a common law right to life and liberty and that a perfectly lawless state was perfectly compatible with our republican, democratic constitution based on the principles of liberty and justice?

Our sensibilities were so dulled that we could not react violently against a near fascist regime producing a film defaming its political opponents as fascists and criminals. How did we become insensitive to the vulgarity of a young man being paraded round the country with high dignitaries kneeling before him and with offices being closed to honour his arrival? Officers administrators, engineers, doctors and media men readily agreed to demolish poor people's homes, sterilise compulsorily the aged and the young after being taken to the camps as animals are taken to the butcher and publicise all this as the work of a new messiah.

The terrorising of the people, and institutions of democracy, the devaluation of the Cabinet, Chief, Ministers and organs of administration and justice were followed by an increase in the tempo and variety of falsehood The first year of the Emergency was presented as the year of fulfilment and the Emergency itself was projected not as a regrettable necessity (if at all) but as a historic achievement. The arrogance of a person was presented as "Thunder of Freedom" and one who seemed to have learnt little from the letters of a father was portrayed as teaching history to children.

AND then the ordinances, the laws, orders and constitutional amendments ! An Emergency, proclaimed ostensibly for meeting a particular situation, was used to alter the basis of our polity in an atmosphere of creeping terror, of emasculation of public opinion, of smothering of dissent, of the frenzied display of self-glorification, megalomania and the glorification of a family.

Eminent men, voicing their concern, found that their letters were not answered. Letters from Members of Parliament about ill-treatment, harassment bordering on sadism, deaths in detention were filed away. And can one still claim that one was not aware of what was happening? What did Parliament do when the High Courts had found the argument of the prerogative to kill even illegally as a "starting proposition"?. Was not Government permitted to get away with the arguing before the Supreme Court that such a prerogative was not outside the constitutional framework—the prerogative of lawless government, in short?

How did the urban intelligentsia react to all this ? Can all of us say that we did not make money on the side or advance our cause basking in the sunshine of rationalisation of and support to a regime of vengefulness, deceit and incapacity even for basic decency? Did we not find smug comfort in the sanctuary of conformism, toadyism and dishonest partnership with the wildest excesses of fantastic lawlessness? Did not journalists, lawyers, businessmen, professors, officers vie with one another in the affirmation of the social validity of personalised government as the ultimate of socialist wisdom? Did we not speak of the Emergency as the answer to the poor man's prayers when it was the rich who benefited and it was the poor who were not only victimised but even deprived of the right to be heard? Would the present atrocities on Harijans have come to light if they had occurred (as they did occur) during the Emergency?

OVERNIGHT, we had a breed of defenders of order, discipline, rural poor and dispossessed and crusaders against blood suckers—most of them bloodsuckers themselves, who made a neat pile out of litigation, lecture tours abroad, toadyist painting and mushrooming journalism, stemming from emergency patronage not to speak of those who held on to their badges of "honour" and accepted positions to Government juries, panels, advisory boards and other subtler forms of buying the loyalty of journalists, professors, lawyers, poets, writers, artists, businessmen, trade unionists and a whole lot of men without truth, honour or self-respect.

This was the great infamy of the Emergency—the cowardice and untruth and aggrandisement and toadyism of the intelligentsia class. This is what "freedom" and "development" had done to this class. With "freedom" we lost our capacity for moral and intellectual courage and spiritual humility A strange assertiveness came upon us robbing us of the excitement of intellectual and moral challenge, the ability of striving and groping for the truth and the adventure of ideas. Where, in bondage, there was torment of the soul, now, in "freedom", there is the swagger of the body. The intelligentsia, once noble and fearless, is now lost in conformism and self-seeking "Development", far from ending material destitution, has brought about India's spiritual destitution also Men are gripped by fear. We seem to be living in a prison called "freedom" and through development, so called, we seem to have strengthened the prison walls of comfort, to an extent that we do not know how to break out of this prison and what it is to be free Men, who were once brave in struggle, have now become cowardly in the sanctuary of quiescent acceptance

And there is often a posture of outraged conscience (which normally should have been as sensitive as a sunburned neck) just as was seen in the hue and cry about "*vichar*", as though there are not enough facts to conclude, not merely to infer, that murder was only one

step away. "Rationalists are admirable beings; rationalism is a hideous monster", said Gandhiji. We have become so steeped in rationalism, not rationality, that the fact of a judge visiting another late in the night and mentioning a rumour does not appear to us to be unusual and we demand proof of malice aforethought. Similarly, the arrests, the letting loose of terror, transfer of judges, concealed and not so concealed threats to them even by the highest executive, the arrogant response of silence to letters from the tallest of men, the immunising of individuals from law, the argument that men and women in this country can be deprived of life and liberty even without the sanction of law, the deaths in detention without even relatives being told of the circumstances of their death, summary punishment far worse than under the Rowlatt Bills, the frequent talk of a sinister plot to kill a Minister as a dress rehearsal to kill someone much higher in the hierarchy, the persecution complex of being encircled and threatened, "scenting danger in every honest speech, detecting conspiracy in every combination and inviting violence from the people in order to crush them" (to use the words of the Motilal Nehru Committee), the repeated demonstration of an ability to commit the greatest excesses and yet assume a posture of wide-eyed innocence, and finally the talk of the unfinished task of vanquishing an imprisoned and manacled opposition—what else remained to vanquish them? All this, it seems, is not enough proof of a relentless logic!

THIS is the great infamy—the partnership of the intelligentsia and people's representatives so called with tyranny and falsehood and the subsequent posture of outrage when the criminals are exposed for what they were and are. Now the talk is heard of too many enquiries and commissions, instead of anger that the perpetrators of the greatest crimes against the country put on the sham appearance of pilgrimage to a saint—who was treated no better than others during the emergency—and exploit the ferment in the country to create an impression that trains and planes do not run on time, that the harijans have lost their saviour and that the messiah must return. We must remember Nuremberg, we must remember the trials in modern Greece. The least that we should do is to ensure that the kind of crime that was committed against this country shall not pay. If we are not careful, we may even be told that there never was an emergency except as a fiction in our mind. And like General Dyer who was given a purse by the unrepentent sections of the English people, the criminals in this country may also be rewarded, if we do not wage a sustained battle against any condoning of the crimes against our democracy.

Tomorrow is uneasy. The problems of this country are not easy to solve. Youth is in ferment. Social tyrannies continue to flourish. There is mass poverty. Prices are not likely to come down in any appreciable measure. There is crime. There is a rat race for emoluments. The intelligentsia can be written off as a community with any ethical fervour. The pressures of the urban parasites will make rural uplift difficult. The people are impatient.

Is there not an objective chance of a cry that democracy cannot deliver the goods? Are there not people just waiting in the wings to take up this cry?

There will always be strikes and agitations in a democracy, more so in a country seeking to emancipate the people from the thraldom of poverty and injustice. Do we meet them with brutality, subscribe to the theory "that once the press is suppressed, there will be no agitations", curb the people's liberties and opt for strong government, which is a euphemism for despotism?

THE threat is real. A dangerous theory gained round that democracy and civil liberty are incompatible with solial justice, that internal danger, supposed or real, can be met only with an emergency of the most fearful kind; that poverty can be ended, chaos averted and production increased only by muffling the press, arresting people stealthily, spreading terror, building up the cult of personaltiy, uttering falsehoods, brutalising the people, torturing them in person, emasculating the judiciary and insulating Parliament from the people. What else is the meaning of the argument that the Emergency was necessary and only its excesses deserve to be condemned?

The Emergency provisions of the Constitution should be abolished or drastically amended. Hitler's example of using the constitution to destroy it, let alone our national parallel, should have long before taught us a lesson. But more than an amendment of the Constitution, the fibre of our people and the human quality of our intelligentsia should be strengthened. We must, of course, demonstrate—not out of vengeance but out of a commitment to some basic values— that perversion will not pay and those who pervert, terrorise and use the apparatus of power for falsehood and self-perpetuation shall be judged by the severest tests and shall pay the price, without merely feeling "utter, utter relief". But we must do more,. We must revive the glorious days of the Gandhi era, when this country and its intelligentsia preferred fearlessness and sacrifice to economism, consumerism and parasitism.

The Emergency was the logical culmination of thirty years of decadence of the urban middle class, fashionably mouthing slogans of Gandhism, socialism and progressivism while wallowing in the mire of modernisation of consumption. Our middle class has long since ceased to be a pace-setter class and has become a camp-follower class. Their self interest has become so much a part of their being that they do not even realise the hypocrisy of their tongue-in-the cheek concern for the poor and the down-trodden. They forget that they are part of the process of exploitation, the apparatus of tyranny.

Those in authority must remember that they were voted to power not in an ordinary election but on the crest of an elemented fervour. The lesson for them is that undue dependence on an aggrandising bureaucracy and an unethical class of urban "intellectuals" and greivance-ridden, demand-oriented organised sector of business, industry and employment is the surest way of digging their grave, disappointing once again the long-suffering noble people of this land and deepening India's moral, spiritual and material destitution. The combined urban class is the biggest enemy of the half-starved, seminaked people who have neither food nor the ability to fight for it, who have no lobbies, who have lived without a hope.

FINALLY, those who believe they can serve in small measure their hapless brethern, should preach with Tagore, that "the late events have conclusively proved that our true salvation lies in our own hands" and say with Mahatma Gandhi that "our salvation and its time are solely dependent upon us".

—R K

THE DEMOCRATIC PROCESS—1

Not a Mere Exercise in Management

Dr. V.M. Dandekar

THE DEMOCRATIC process in the economic sphere has often been misunderstood and misrepresented to mean an unrestricted right to private property and unrestrained operation of the doctrine of *laissez faire*. This is, of course, not correct.

The democratic process cannot remain unconcerned about the concentration of economic power in the hands of a few. It cannot also remain unconcerned about the lot of the poor who, in a poor country, are, indeed, in the majority.

But in their desire to prevent concentration of economic power and in their concern for the poor, democracies have often permitted enormous concentration of politico economic power in the hands of a few unscrupulous self-speaking politicians, with the consequent expansion of the bureaucracy and its arbitrary power over the economy. This undermines the very democratic process.

In the economic sphere, the democratic process, then, consists in positively promoting and strengthening a decentralised structure of decision-making in which innumerable individuals, voluntary associations, co-operatives, corporate bodies and statutory democratic authorities may actively participate

Negatively, it must prevent the emergence of monopoly power whether of the capitalist or of the organised labour. It must avoid expansion of bureaucracy unless it is essential. It must also keep a close vigilance over the activities and affairs of the politicians who, in league with the monopolists and bureaucrats, are prone to seize politico-economic power and undermine the democratic process.

Let me illustrate. Consider the ceiling on agricultural holdings. This has become so much a part of public policy that one does not realise that it accords a very special and arbitrary treatment to one category of the means of production, namely, agricultural land Besides, the particular ceilings imposed are essentially arbitrary.

Distribution of the surplus land is at best arbitrary because those who are supposed to get the land often have neither the means nor competence to cultivate. By and large, the entire operation is fraught with petty bureaucratic corruption and political fraud

Contrast this with the proposed agricultural holdings tax It does not impose an arbitrary ceiling on land holdings. But it creates pressures for a redistribution of land in the desired direction.

Futile Exercise

With a progressive tax, a larger landholder will find it much less profitable to keep a hectare of land than a small holder will find it to add a hectare to his land. But the decisions to sell and buy are made by the persons concerned and governed by the efficiency of cultivation and incidence of taxation It keeps the role of the bureaucracy and the politician to a minimum.

Or consider the legislation of minimum wages in agriculture. This has been a meaningless and administratively wasteful exercise because it is not possible to enforce a minimum wage unless there is an obligation to give employment.

Contrast this with a rural employment guarantee programme It automatically ensures minimum wages in agriculture. Besides, it will gradually eliminate the very small and uneconomic holdings because such small and uneconomic holders may prefer wage-employment and may, in due course, withdraw from agriculture.

This is good for them and good for agriculture. It has been a futil exercise trying to settle everybody o small uneconomic holdings.

The same is true of a great deal o make-believe selfemployment i many village industries, artisan occupations, and the newly expandin tertiary sector represented by th roadside tea shops

Many of the self-employed i these categories do not make a minimum income and may prefer wage employment if guaranteed for minimum wage. There is no reaso to be sorry about this.

Past policies and programmes t create self-employment have expanded bureaucracy, have create political vested interest and have don little to the people except to mak them hopelessly dependent upon th petty bureaucrat and the pettie politician.

Consider another instance, namely distribution of essential commodities of mass consumption such a foodgrains. There is little doubt tha this cannot be left entirely to th operation of the private trade.

But the alternative is not necessarily its bureaucratic and politica management as the past policies an practice seem to have assumed. Suc management has proved to be bot expensive and inefficient It has discouraged quality-grading and standardisation so essential to improve service, to the consumer and bette return to the producer

Even more undesirable has bee the manner in which prices and movement of essential commoditie across the country have become subject of political bargaining.

An alternative is a public distribution system in which bureaucrati control and political interference i kept to a minimum; which is sufficiently decentralised to leave th decision-making to a large numbe of autonomous public marketin organisations and which functio essentially on the principle of th market. This is feasible The democratic process must seek such solutions

In business and industry, the democratic process must have a two fold objective: (1) to prevent monopoly conditions (2) to decentralis industrial and business managemen It should be recognised that i certain industries, because of technology, large investment and long gestation period, monopoly condition become inevitable But rather tha trying to regulate them, the govern ment should take them over an manage them as public utilitie

---

Dr. Dandekar is Director, Gokhale Institute of Economics and Politics, Pune.

Where monopoly is unavoidable, it should be a public monopoly,

Minimum Need of the People

In many service industries such as rail, road, air and sea transport, banking and insurance, post, telegraph and radio communication, and power and irrigation, centralised management is justified on these grounds The democratic process must minimise political interference in the management of these sectors and improve their efficiency

Secondly, it must expand these activities of the government to other areas such as provision of drinking water, sanitation and public health facilities particularly in the rural areas. These are essential minimum needs of the common people and the democratic process must give them the highest priority.

The second objective of the democratic process is to democratise industrial and business management Firstly, it must promote and strengthen appropriate consumers', producers' and workers' cooperatives. Secondly, it must promote workers' active participation in management. What is being done is trivial At best, it has brought the collective bargaining to the board room

Conditions in public sector undertakings are no different and it has become clear that the mere act of nationalisation or the mere fact of the capital being socially owned does not alter the relation between the management and the workers

For a meaningful participation of workers in management, the workers must participate in the ownership of the equity capital of the firm. The democratic process must initiate the necessary process.

For instance a beginning may be made by issuing bonus shares to the collective account of workers whenever bonus shares are issued to the ordinary share-holders of a firm It is only through such a process that the workers interests will be gradually identified with the interest of the firm and workers will begin to participate in its management meaningfully.

Collective bargaining is part of the democratic process and the workers have a right to strike in order to press their legitimate demands and grievances; but they have no right to stop work and production. Importance of keeping the production going needs no emphasis.

As the economy develops and becomes more complex, several sectors and several industries become interlinked so that stoppage of work and production in one affects the production and employment in several others No section of the society can have such right to hold the rest of the economy to ransom. A mechanism must therefore be found to keep the production going without denying the workers' right to strike.

Workers' Right to Strike

If conditions of strike emerge, notice of strike will be given and conditions of strike will be simulated except that production will continue. The workers will not receive wage nor will the management be entitled to profits during the period of strike

This, not the stoppage of work and production, is the essence of strike. The wages and profits during the period of strike shall be credited to a separate account and may be used for such purposes as paying wages during a period of lay-off caused by circumstances beyond the control of the particular firm, as for instance, power-shortage

It is thus that we concede the democratic right to strike but prevent the undemocratic practice of holding the whole society to ransom by stopping work and production

Income Distribution

In the field of planning, the democratic process must concentrate on achieving an income distribution which will assume a minimum living to everybody

Instead the planning effort in the past has been spent on making demand projections and, on that basis, allocating investment and then trying to channelise private investment in the planned direction through an elaborate system of licensing and regulation This has been a futile exercise. It is wasteful when, as often happens, the demand projections go wrong because the planned rates of growth and the desired changes in income distribution do not materialise

The system has provided, in the main, a forum for an intimate and day-to-day contact of the private business and industry with the bureaucracy and the politician lending to corruption and, in the final analysis, to the control and regulation of government by the big money and undermining of the entire democratic process.

Ironically, it is the democratic power structure as it has emerged during the past 30 years which has undermined the democratic process in the country. To restore democracy, this power-sructure must be attacked at its source, demolished and got out of the way. That source is the profits of political office. Without their abolishing, it is futile trying to restore democracy

Profits of Political Office

Profits of political office can be abolished only politically, that, is by agreeing to a code of conduct In a democracy, the essential requirement of a politician is that he must be accountable to the public and that, therefore, the public must be informed authoritatively about his affairs. His life must be an open book above public doubt and suspicion. Only those who are willing to abide by this requirement may aspire for democratic leadership.

More specifically, two conditions must be met. Firstly, the wealth and incomes of all politicians from top to bottom must be open to public gaze and scrutiny. Secondly, persons having wealth and income above a certain prescribed limit must be disqualified for standing for any election and holding any political office

These requirements may sound Platonic. But they, indeed, are the essential conditions for restoring and preserving the democratic process Evidently, the politicians are unwilling to accept voluntarily this democratic code of conduct The people must press that the code of conduct be written into the constitution. □

I impeach him in the name of the people of India, whose rights he has trodden under foot, and whose country he has turned into a desert. Lastly, in the name of human nature itself, in the name of both sexes, in the name of every age, in the name of every rank, I impeach the common enemy and oppressor of all.

—Edmund Burke
Impeachment of Warren Hastings

Fear not the tyrants shall rule for ever, Or the priests of the bloody faith; They stand on the brink of that mighty river, Whose waves they have tainted with death.

—Shelley, Rosalind and Helen.

Think'st thou there is no tyranny but that of blood and chains? The despotism of vice, The weakness and the wickedness of luxury, The negligence, the apathy, the evils Of sensual sloth—produce ten thousand tyrants.

—Byron

Failure of the Intelligentsia

Prof. P.G. Mavlankar

THE DEMOCRATIC PROCESS at the root is a human process. If one goes deeper, one can see it as a spiritual process too. As such, it is an exhilarating exercise and a refreshing experience. I do not propose to dwell on these philosophical and pure realms of this vast and exceedingly fascinating subject

I would like to put across in a nutshell a few thoughts and some concrete suggestions regarding the various facets of the democratic process, the different levels at which it operates at home and abroad, and some of the major challenges it faces in modern times.

In doing so, I shall confine myself to the political aspects of the democratic process, although one should well remember that democracy is not just a matter of governance of polity, but much more, an attitude of mind and a way of life. Viewed from its entire context, therefore, the democratic process at heart is a civilising force.

Let me at the outset stress the inevitable gradualness of the democratic process. There are no short cuts in a democracy, and nothing worthwhile is achieved or arrived at too swiftly either. The democratic process is essentially one of evolution and growth. In that sense, it is in tune with nature and natural instincts and urges.

Its various operational levels are—severally and collectively—spiritual, human, social, political, economic, educational, judicial and cultural. In a democracy, both the individual effort and social endeavour are interwoven in the democratic process, thereby promoting individual interest as well as social welfare.

Ideally, the democratic process must operate at individual as also institutional levels. In actual practice, however, the institutional apparatus dominates, often reducing the individual and his striving to almost a cipher.

Prof. Mavlankar is a Member of the Lok Sabha.

When an individual becomes a non-entity and finds himself to be of little or no relevance to the community and its well-being, he grows increasingly indifferent and in the end apathetic. This disinterest of the individual constitutes one of the perennial challenges to democracy. No country in the developed or the developing world has as yet tackled this problem squarely or successfully.

To most citizens in most countries the actual operations of governance in their respective politics—whether they be democracies or non-democracies—remain distant, if not foreign, and this creates a threat to the smooth functioning of a democracy, for the gulf between the rulers and the ruled remains as wide and even unbridgable as ever.

That is why the first task as well as the last target in any democracy is to make the individual citizen take continued interest in his polity, and then enable him further to participate in the processes of development of the polity of which obviously he is a part. The persons engaged in the democratic process in several countries during the last many decades have been doing precisely this sort of political exercise.

The several facets of such democratic functioning can be seen in the healthy structures or otherwise of the peoples' participation at the grassroot and constituency levels through their representative bodies, from the Panchayats upwards to Parliament.

The more significant other operational agencies in a democracy are the political parties and pressure groups including trade unions and specialised or expert bodies or associations, the free and critical press with all its force and numbers, the multifaced communication media like the Radio and T.V., various public institutions which are at once learned and seasoned, scores of voluntary social institutions or groups and the intelligentsia and the elite at the universities and similar academic centres.

All these bodies throw open the creative and restless souls in a given society, and ultimately it is such individuals with a concern for human values and social welfare that strengthen the democratic process in any country. As a result the presence of the spirit and practice of dissent helps fortify the democratic process.

Overcoming Ignorance

The continued existence of widespread illiteracy does not pose so great a problem as the deliberate or complacent manner in which deep-rooted ignorance is allowed to stay, if not grow. It seems to be there is almost a vested interest in keeping the people ignorant.

I am far from suggesting that we should tolerate, and not attack, the evil of illiteracy. Of course, everybody must learn the 3 R's—reading, writing and arithmetic. But a mere existence of cent per cent literacy is no gurantee that a people will think and act democratically.

The basic tool is the assured free and continued supply of information and facts as well as news and views, to the people at large It is the absence or at any rate the frequent interruption, of such a facility that bothers me, for it finds the countless commoners, having an inevitable common sense, being deprived of the tools with which they could form opinions and come to a judgement on this or that public issue

The other aspect of the matter that worries me is the fact that the voters in our developing democracy are not being seriously educated. The nineteenth century slogan in Britain was "Let us educate our masters". But we have been exciting and inciting, rather than informing and educating our masters.

The said spectacle, therefore, is that a lot of demagogy goes on in the name of democracy and, instead of talking sense to the people, most of us try to fool and occasionally even cheat the people. How many of us have looked at a general election as a splendid and valuable opportunity for an intimate and active dialogue between the rulers and ruled, between the political parties and the voters' indeed, among the various peoples themselves?

Apathy of the Educated

Six general elections have been held during the first 27 years of our democratic republic. Our voters have happily shown an increasing awakening and a growing alertness. The last Lok Sabha election in March this year has been particularly telling and rewarding in exhibit-

ing a tremendously hopeful democratic consciousness of our teeming millions. We must confess that apathy of literate voters, the sheeplike mentality of many of our 'masters,' iritating indifference to public issues and causes shown by so many educated persons, do still pose as acute problems facing the nascent democracy of ours.

In a country like Australia, voting is by law compulsory. I am not sure, however, if such compulsion works or pays. Our endeavour should be to reach the maximum percentage of poll by education and persuasion rather by prescription and legislation. I am also of the view that the voting age in our country must be reduced from 21 to 18. A large number of the countries have already done so, and we need not linger or lag behind in this respect any more.

One serious obstacle in the democratic process is the persistent predominance of 'caste' considerations at various stages of selection and appointment and in the election process itself. The accompanying menaces of 'provincialism' and of 'language' also persist.

The politicians do not enable the people to come out of the caste, sectional and regional and linguistic loyalties; and instead of helping the people to rise above these walls, many politicians often try to turn and tune them to their own narrow and shortlived political advantages. Education does not as yet seem to play its part by providing an effective antidote to all this chauvinism. On the other hand, the sad reality is that the so-called educated amongst us try to exploit the situation and the sentiment to suit their temporary gains.

Critical Public Debate

Another impediment is the inadequacy of a sustained, free, critical public debate in the country. Oftentimes there is no continued ceaseless, concerned and concentrated criticism of the different policies and persons in various spheres of public life.

The role of the intellectuals in this regard is depressingly passive, they have, on several occasions, badly let down the people and on genuine popular causes and issues. The 'fathers' of our Constitution considered the universal adult franchise as an article of faith and they have been by and large vindicated. But the educated and the elite have not come up to the levels of expectation and promise.

That a successful democratic process implies strong and sensible stewardship at several levels is also not fully appreciated. The democracies do also require good leadership. It should not, however, be confused with 'one-leader' frenzy or with 'one-manships'.

Myth of Indispensibility

Arbitrary and authoritarian rule is antithetic to democratic processes, and a strong or stable government is not to be equated with irresponsible or irremovable government. That is why the practitioners of the democratic process always dismiss the principle of the indispensable leader, and insist that hero-worship or personality cult or deification of any individual however great and good is suicidal to democracy.

Any assessment of the democratic process will undoubtedly include a detailed reference to the party machinery, its fabric and functioning. The nature, rise, role and contribution of a political party is crucial if not central to the fruition of the democratic process. But to say that political parties are useful and necessary tools and vehicles in a democracy is not to suggest that they are everything.

Certainly, the political parties are not the be-all the end-all of the democratic process. Parties are inevitably handicapped by several and sometimes severe limitations. By the very nature of things, a party views and represents only a part and no matter how big a part is, it cannot be equated with the whole.

This is why party loyalty must, in the end and whenever necessary, give way to national loyalty; the party interests and the national interests do not necessarily or always coincide. Political parties do undoubtedly make representative government possible and workable but that in itself does not and cannot make the parties infallible and indispensable in everything.

Democracy cannot automatically be linked with economic growth and prosperity, literacy and technology, although each of these is a must if democracy is to survive. What is required basically, however, is a certain sense of democratic values and behaviour amongst all citizens. A certain maturity and a certain wisdom on the part of the ordinary people make the democratic process run well and fast.

Need for Speed and Dynamism

The democratic process, particularly in the developing world, must pick up a certain speed and dynamism; the poor and the hungry cannot and should not wait endlessly or indefinitely. The luxury of the long drawn out processes in a democracy must, therefore, be reconciled with the life and death problems of the countless commoners.

All said and done, however, I am not at all pessimistic about the out look for democracy in India and the world. Given an informed, educated and enlightened public opinion, and using a wide range of flexible and yet fundamentally sound techniques of the democratic process, there is nothing we cannot achieve in a decent and democratic way, and in a civilised and cultured climate.

Indeed, I feel optimistic and even enthusiastic about the good prospects of gradual growth of genuine democracy on our globe. And, because democracy alone contains a self-corrective mechanism and since the safety valve is built in the democratic process itself, the only effective remedy at any time of diminishing democracy, remains the instant injection of a greater doze of democracy in the body politic of the nation. ☐

"By political independence I do not mean an imitation of the British House of Commons or the Soviet rule of Russia or the Fascist rule of Italy or the Nazi rule of Germany. They have systems suited to their genius. We must have ours suited to ours. What that can be is more than I can tell. I have described it as Ramarajya, that is, sovereignty of the people based on pure moral authority...

"My conception of Ramarajya excludes the replacement of the British army by a national army of occupation. A country that is governed by even its national army can never be morally free and, therefore its so-called weakest member can never rise to his fullest moral height...

"India is essentially Karmabhumi *(land of duty) in contradiction to* bhogabhumi *(land of enjoyment)...*

"The State represents violence in a concentrated and organised form. The individual has a soul, but as the State is a soulless machine, it can never be weaned from violence to which it owes its very existence." **Mahatma Gandhi.**

THE DEMOCRATIC PROCESS—3

Economic And Social Facets

Nikhil Chakravarty

THE DEMOCRATIC process has a wide spectrum covering practically every aspect of modern society political, social, economic and judicial. The struggle to attain democracy is as old as history.

Harold Laski underlines the rich content of democracy when he says: "Men have found its essence in the character of the electorate, the relation between government and the people, the absence of wide economic difference between citizens, the refusal to recognise privileges built on birth or wealth, race or creed. Inevitably, it has changed in substance in terms of time and space".

The aspect of the democratic process in which I am very much interested is its social implication. In reality, the social facet of democracy cannot be taken up in isolation from its other aspects. In the Athenian democracy of ancient Greece, for instance, the remarkably advanced type of political democracy was based on the economic and social foundations of slavery, and even justice would not regard a slave as having any rights as such when he was the property of his master, the citizen.

Struggle Against Inequality

In some form or other, this social inequality has coexisted with political democracy up to the modern times. When Abraham Lincoln had to wage a full-scale civil war, it was the social, economic and judicial aspects of democracy that were involved in the struggle of the American people for getting over one of the anachronisms of history, namely slavery.

At the same time, wage-slavery in some form or the other has persisted and still persists over a large part of the world today. And it is in the context of our own endeavour to over-come this in our democratic structure that the inscription of socialism in the definition of our Republic gains significance : it sets the goal, though the journey to reach it cannot but be arduous.

The social facet of democracy involves many issues. From the end of the Middle Ages, the struggle for religious equality formed an important chapter of Europe's struggle for democracy.

In our country while the beginnings of political democracy could be discerned in the republican states of ancient India, it was Buddhism which gave a tremendous impetus to democracy in the social sphere. However, the reverse process set in with the introduction of the hidebound caste system which prevails even to this day as a scourge of the Indian socio-economic life.

Today, we have to realise that the commitment to secularism cannot be regarded in isolation from the attainment of political democracy. The concept of religious equality, which is the essence of secularism, is an integral part of the over-all democratic process.

It is important to note in this context that the struggle against social inequity has generally been conducted as an appendage to the battle for political democracy. In our country when the struggle for independence assumed the character of a nation-wide mass movement under Gandhi's leadership, there came up almost inevitably the question of the untouchable's right to enter the temple.

As we have moved forward towards the establishment of political democracy, particularly with the introduction of universal suffrage, one can no longer ignore the claims of the Harijan not only to social equality in terms of equal opportunity, but to a better economic deal, for instance, for the agricultural labourer.

Much in the same way, the democratic process in the social sphere manifests itself in the form of the struggle for women's emancipation. The suffragette movement in Britain came as a follow up of the establishment of political democracy.

In our country, the participation of women in the freedom struggle—which is but another name for the assertion of political democracy—resulted in complete equality in the matter of adult franchise. And as our political democracy advanced there came important measures such as the right of wome to property, marriage and divorc laws.

In recent years, the demand fo equal pay for equal work has bee met at least on the plane of legis lation and there have also bee enacted special labour laws guaran teeing protection to working women

Expansion of Social Services

Democracy in the social spher cannot materialise without the ex pansion of social services, such a facilities for health and housing In this sphere, the advanced de mocracies of the West have take steps only in the postwar years that is, long after the establishmen of political democracy. In the con ditions prevailing in our country the progress in this branch has bee admittedly inadequate considerin the vast dimension of the problem

With this comes the question o provision for universal education fo all, so that the privilege of th affluent to the acquisition of know ledge could be broken down. Thi is a task to which those in authority whatever their political complexion provided they have a commitmen to democracy, can hardly overlook

At the same time, it needs to b underlined that the promotion o education by itself cannot furthe the cause of democracy unless an until its economic counterpart, th ensuring of employment for th educated is assured. Here is case of the interlinking of the soci and economic facets of democrac

However, this is not a proble peculiar to our country. In th economically advanced countries o the West, it is felt in acute form For example, in the USA, th coming up of the Black Power ha reinforced the entire movement o the under-privileged for a bett socio-economic order.

No society, however develope can attain real viability until th millions within it can find a stak in its continuance, and this will b possible only when the soci economic rights of the common ma are not only recognised but enforce

This question has an importa bearing for our country, committe to a democratic order. On th political plane, our democracy h proved its mettle as the recent gener election has once again demon trated. There is, however, a lo way to go in the economic and soci spheres before we can claim to be fully grown democracy.

The wide disparity in income th prevails in our country offen

against the concept of economic democracy. And until this gap between the have and the have-not is reduced, the social facet to Indian democracy can hardly be strengthened. Education, housing, health are no doubt important aspects of our national programme demanding urgent attention. But these by themselves cannot be sustained unless and until the grinding poverty that faces the majority of our people is overcome.

The Human Personality

The question inevitably arises as to whether such an objective can be attained within the given socio-economic structure. This is a question which has been the concern of many thinkers, political leaders and economists in different countries. In the West from Keynes to Galbraith, there have been a number of attempts to refashion the capitalist structure to meet the urgent social needs of the times.

In our developing economy with our commitment to democracy, secularism and socialism as enjoined by the Constitution, the need to refashion our socio-economic structure is imperative, because political democracy, even if it is protected from serious aberrations, as experienced during the recent emergency, cannot by itself ensure the full flowering of this great nation's many-splendoured genius

For that, the economic and social facets of our democratic process have to be given the fullest scope. Without the necessary socio-economic content, democracy can be only a facade for perpetuation of various forms of exploitation We cannot escape the injunction that democracy in the ultimate analysis has to ensure the eminent dignity of the human personality in all its aspects.

People's Participation

The democratic process, however, cannot be sustained by mere legislative measures or executive action. What is needed is the active involvement of the public. It is only a vigilant public opinion that cannot only enjoy but guard the precious assets of any democratic order. This is particularly necessary in the sphere of social functioning of democracy.

Whether it is the law against untouchability, or it is the law against discrimination against women, there is possibly no way of enforcing them without the people at different levels, both in the cities and in the countryside, coming forward and helping in the enforcement of such measures. A community which depends only on the legislature and the executive to run a democratic order can never get an enduring system of democracy.

It is here that various non-official bodies, political parties and mass organisations as also the various media of mass communication can and have to play a definite role. The backward element in our social structure can only then be awakened and the obscurantist element eliminated. Eternal vigilance is the price not only of liberty but of democracy as well □

THE DEMOCRATIC PROCESS—4

Liberty Lies in the Hearts of Men

H.R. Khanna

DEMOCRATIC PROCESS has various facets, the important being social, political, judicial and economic

I shall deal with the judicial aspect This would necessarily call for proper appreciation of the role of courts, nature of judicial review and importance of the rule of law in a democratic set-up under a written Constitution like ours

The Constitution is our supreme law or, as the Germans describe it, the basic law It is the provisions of the Constitution which constitute the touchstone of judging the validity of the other laws

All legislative enactments and executive orders have to conform to the provisions of the Constitution. In case there is any conflict or inconsistency between a legislative enactment or an executive order and the provisions of the Constitution, the legislative enactment or the executive order to the extent of inconsistency and repugnancy would be void and unconstitutional

Who then is to judge whether a legislative enactment or executive order is or is not in consonance with the provisions of the Constitution? This task has been entrusted by the Constitution to the courts

In discharging this function and adjudicating upon the constitutional validity of legislative measures and executive orders the courts exercise what is called the power of judicial review.

A lot of heat and controversy is sometimes generated regarding this power of judicial review, but if we understand the true nature and importance of judicial review, we would find that so much of heat and controversy is wholly uncalled for. To explain the nature and scope of judicial review, I can do no better than to repeat what I said in Kesavananda Bharati's case.

In exercising the power of judicial review, the courts do not and cannot go into the question of wisdom behind a legislative measure The policy decisions have essentially to be those of the legislatures. It is for the legislatures to decide as to what laws they should enact and bring on the statute book

Function of the Courts

The task of the courts is to interpret the laws and to adjudicate about their validity. They neither approve nor disapprove legislative policy The office of the courts is to ascertain and declare whether the impugned legislation is in consonance with or in violation of the provisions of the Constitution

Once the courts have done that, their duty ends The courts do not act as super legislatures for, if they were to do so, the courts will divert criticism from the legislative door where it belongs and will thus dilute the responsibility of elected representatives of the people.

While exercising the power of judicial review, the courts cannot be oblivious of the practical needs of the government. The door has to be left open for trial and error. Constitutional law like other mortal contrivances has to take some chances. Opportunity must be allowed for vindicating reasonable belief by experience.

The Constitution, it may be added, is not a historic parchment in a glass case. It is a continuous process of delicate governmental adjustments In dealing with the provisions of Constitution, the courts have to

---

Shri H R. Khanna is a former Judge of the Supreme Court.

take account of the day before yesterday in order that yesterday may not paralyse today. They have also to take account of what they decree for today in order that today may not paralyse tomorrow.

The Constitution of India ushered in, as would appear from its preamble, a democratic republic. Democracy throws a great measure of responsibility upon the citizens. Where the people do not take a continuous and considered part in public life, there can be no democracy in any meaningful sense of the term.

The grandeur of the aims of democracy is matched by the difficulties of their achievement. Democracy is a continuous and ceaseless process or, to use the words of Frankfurter, it is a beckoning goal, not a safe harbour.

Likewise, freedom is an unremitting endeavour, never a final achievement. Democracy furnishes the political framework within which freedom and liberty can and should thrive most generously. Democracy in which the spirit of liberty does not reside is a dead house.

It is axiomatic that eternal vigilance is the price of liberty. Liberty, it has been said, does not exist only in the laws, which are always more or less badly executed, but chiefly in the constant habits of the nation.

Rule of Law

Learned hand has put the same idea in words which since then have found an echo in numerous writings when he said "I often wonder whether we do not rest our hopes too much upon constitutions, upon laws and upon courts. These are false hopes; believe me, these are false hopes Liberty lies in the hearts of men and women; when it dies there, no constitution, no law, no court can save it; no constitution, no law, no court can even do much to help it While it lies there it needs no constitution, no law, no court to save it".

While talking of liberty, we must not also forget the warning of Burke when he said that people never give up their liberties under some illusion. The true danger is when liberty is nibbled away for expedience and by parts.

A very important postulate for the success of democracy is the rule of law. A wind of iconoclasm today sweeps the minds and the gods we worshipped till yesterday are being dethroned from the minds of people one after the other.

It is precisely in moments like these that the rule of law acquires added importance, for it is the rule of law upon which depends the existence and orderly progress of a stable society. Laws embody a code of self-discipline which a nation speaking through its representatives adopts for itself and enforces through the machinery of the courts.

Man may be a little lower than the angels. He has not yet shaken off the brute, and the brute within is apt to break loose on occasions. The rule of law provides an anchorage in the lives of individuals as also in the storms and tempests which sometimes engulf a nation.

The rule of law also constitutes a shield against the whims and caprices of an individual or a group of individuals. The rule of law is the antithesis of arbitrariness Since the dawn of civilisation, the choice before mankind has been between two different points of view, namely, rule by will or rule by law.

In the aggregate, the choice has been in favour of the rule of law for experience has taught us that if ordinary men were allowed to rule by will alone, the interests of the community would be sacrificed to those of the ruler.

On occasions, we have slipped back into government by will, only to return again, sadder and wiser, to the rule of law when hard facts of human nature demonstrated the essential egoism of men and the truth of the dictum that all power corrupts and absolute power corrupts absolutely

Index of Free Society

The rule of law is now the accepted norm in all civilised societies. It is indeed regarded as the index of a free society Even if there have been deviations from the rule of law, such deviations have been covert and disguised for no government in a civilised country is prepared to accept the ignominy of governing without the rule of law.

Although the content of the rule of law is different in different countries, everywhere it is identified with the liberty of the individual It seeks to maintain a balance between the opposing notions, individual liberty and public order.

In every State the question arises of reconciling human rights with the requirements of public interest. Such harmonising can only be attained by the existence of independent courts which can hold the balance between the citizen and the State and compel governments to conform to the law.

An Aid to Progress

The rule of low is not the enemy of progress, nor is it an ally of moribund past or a handmaid of reaction. Its object is to introduce smoothness in the act of change, to prevent upheavals and eliminate jolts in the onward march of society, to synthesise it with stability, to set up rapport between the past and the present and to project such rapport into the future.

When wisely and imaginatively employed, law is far more than an instrument of command; it is organised society's principal resource for the engineering of that widespread and supportive public assent the true consent of the governed without which great social initiatives never really get off the ground.

Democracy can survive and flourish only if there be due deference for the rule of law Democracy postulates that everybody should be under the law, none above it. Government under the law means that the power to govern shall be exercised only under conditions laid down in the Constitution and the laws

Law thus emerges as a norm limiting the application of power by the government over the citizen or by citizen over their fellows. At the same time that the law enforces duties, it also protects rights.

PROTECTOR OF CITIZEN'S RIGHTS

Government under law thus seeks the establishment of an ordered community in which the individual, aware of his rights and duties, comprehends the area of activity within which, as a responsible and intelligent person, he may freely order his life, secure from interference from either the government or other individuals.

One of the great tasks which the framers of the Constitution have to face is to provide for checks and balances lest there should be too much concentration of powers in one individual or one group of individuals

In framing a government which is to be administered by men over men, the great difficulty lies in this. You must first enable the government to control the governed; and in the next place oblige it to control itself.

A dependence on the people is, no doubt, the primary control on the government, but experience has taught mankind the necessity of auxiliary precautions. At the same time we have to ensure that there are no obstructions to govern and to govern effectively.

(Contd. on Page..23)

District Planning And The Sixth Plan

Dr. D. Bright Singh

The sixth five year plan will have a bias towards development of agriculture and allied sectors. The programmes of development will be so drawn up that their implementation shall contribute to the improved well-being of the rural population, to the attainment of higher levels of employment and to overall economic growth. Furthermore, it would aim at securing the co-operation of the people at the formulation as well as the implementation stage of the plan. This means that planning should be broadbased and it should be from below.

If planning is to start at the grass roots level, then the districts, villages and taluks must be made the primary units of planning In fact, the sixth five year plan will have to be based on district plans which should contain detailed programmes of development for each district. The importance of district planning lies in the fact that it would take into account the needs of the people and the resource potentialities of each district, and what is most important, it would create a sense of responsibility on the part of the people who would be made to feel that they have a stake in the proper utilisation of the resources of each district and each village. For this reason, the implementation of the plan will be easier and more effective than if it were made to appear as an imposition from above.

Most of the Indian states have by now set up planning bodies to assist the government in planning work—in drawing in the five year and annual plans for the state District planning will be the direct concern of the states and their planning agencies will have to work out a satisfactory method of using district plans as the basis of the next five year plan.

First, the scope of district planning is to be defined. There are certain sectors or areas of development which directly concern a district there are other areas which are of state-wide importance. Agricultural development, minor irrigation, animal husbandry, fisheries, education, village and district roads, public health, etc., come under the first category. To the second category would belong items like railways, power development, national highways, development of ports and harbours, etc. District planning should obviously cover all the sectors which come under the first category. As regards areas of development which are of state-wide importance, planning is to be done at the state level, but the economic impact of such projects on the districts is to be properlye investigated and studied. On the average, the outlay on items under the first category amounts to about two-thirds of the total plan expenditure of a state

Dr. Bright Singh is a full-time member of the State Planning Commission, Tamilnadu

Fixing the Outlay

It is necessary to determine the total plan outlay for each district, that is, for items under the first category mentioned above and also to apportion the outlay for each district among the various sectors of development

To begin with, the total plan outlay for each district can be fixed only tentatively Let us assume that a state's sixth plan would invovle an outlay of the order of Rs. 1,500 crores Of this, the items under district planning would be roughly Rs. 1,000 crores. This amount may be distributed among the districts on the basis of their population (per capita outlay should be the same in all the districts).

This, however, is only the first step and the figure may be taken as a rough norm. In fixing the outlay, which may be higher or lower than the tentatively fixed amount, we may have to consider some aspects For instance, if the present per capita expenditure on category-I items is low in one district compared to others, it is only fair to make the allotment a little more liberally in its case. Similarly the needs of the people in each district indicated by the social welfare facilities available may have to be considered for fixing the rank of a district in respect of social factors. The indicators are : number of houses per lakh of population, number of primary health centres per lakh of population, number of primary schools, middle and high schools and colleges per lakh of people in relevant age groups and the rate of population of scheduled castes to the total population.

Again, economic factors would indicate the level of material well being of the people and also the potentiality for development of a district. The position in this regard is reflected in district income, per capita income, proportion of agricultural and industrial income to total income, number of emloyed people, proportion of employed to employable people, number of houses, length of surfaced roads, area irrigated, area under cultivation, electricity consumption per head, number of bank branches, average size of agricultural holdings etc. The potentiality for growth of a district is indicated by the availability of natural resources—mineral and forest wealth—climatic and soil conditions, entrepreneurial talents and economic overhead facilities. Given the economic and social indicators it would be easy to fix the rank of a particular district If a district has a low rank but has a large potentiality for development, there is a strong case for increasing the per capita allotment, and *vice versa* if the factors indicate an opposite condition

While data relating to economic and social conditions may be found in published reports and official records, it will be necessary to collect information about per capita expenditure in each district on items of development coming under category-I from Government officers at the head of several departments It may be a little difficult to allocate the total expenditure on the different sectors such as industries, agriculture, education, animal husbandry etc, among the districts, but if up-to-date accounts are maintained at the head office it would certainly be possible to get more or less a correct view of the position.

Allocation Among The Districts

The basic principle to be observed in allocating plan expenditure among the districts is that there should be balanced development among them. This would mean that special consideration is to be given to those which are economically and socially

worse off than others.

It is necessary to fix an upper limit to the outlay for each district to ensure that the projects drawn up for each district are realistic and within the resources constraint. Otherwise, overambitious plans will be prepared incorporating a large number of the proposals suggested by district representatives without regard to the financial implications.

Such an upper limit can be fixed by ranking each district with reference to per capita expenditure incurred in the past two years and the economic and social indicators. There will thus be three ranks corresponding to these three factors. Based on these, a composite indicator for each district can be determined. If this composite indicator is below the average it means that the district concerned deserves special consideration in fixing the outlay and *vice versa* This may be illustrated by a hypothetical example of ten districts A ······· J.

District	Per capita expenditure	Social factors	Economic factors	Total 2+3+4	Composite indicator
(1)	(2)	(3)	(4)	(5)	(6)
A	2	6	3	11	2
B	9	9	7	25	10
C	6	7	4	17	6
D	1	2	6	9	1
E	10	5	9	24	9
F	8	4	8	20	8
G	5	3	5	13	4
H	3	8	1	12	3
I	7	1	10	18	7
J	4	10	2	16	5

It is possible to evolve a formula on the basis of which the allocation can be made in an objective manner. If the sixth plan of a state is about Rs 1,500 crore and the development schemes under district planning amount Rs 1,000 crore, 40% (or Rs 400 crore) may be distributed taking into consideration the present per capita expenditure; 30% (Rs 300 crore) on the basis of economic indicators, and the remaining 30% (Rs 300 crore) on the basis of social indicators.

When the total development outlay for each district is fixed, the next thing to do is to apportion this among the different heads of development. Using this scheme of outlay as a framework, detailed plans are to be drafted with reference to the needs and resources of each district and the development schemes proposed for each district and consistent with the sectoral development programmes drawn up by the heads of departments.

At the close of each five year plan, the heads of departments-education, public health, roads, agriculture, industries, animal husbandry, fisheries etc—draw up tentative schemes of development concerning their respective sectors to be incorporated in the next five year plan. These schemes would cover a few or more of the districts. The total allotment for a sector, say for instance, construction of village roads, is first determined and the amount used up in a particular district depends on the length of roads falling within that district area. Similarly for the other sectors. The point to note here is that the plan concerns road construction as one sector, and that the needs of the district as a special unit are not given the importance which it deserves.

Starting from Below

So far as district planning is concerned, the process is to start from below Thus in the case of village roads, we have to consider the present length of roads in a district, the need of repairs and improvement. need of new roads, the effect of investment in road construction on employment, production, education. marketing etc in the district and so on. Here attention is focussed on the integrated development of the village of district This applies to all the development programmes of the district and the combined programmes aim at developing the district as a whole.

In order to prepare a district plan we need, firstly, full details regarding the economic and social conditions of the district, its natural resources, and the availability of economic and social overhead facilities and secondly, proposals and suggestions for the development of the various economic sectors of the district. As for the first, a great amount of information is available in published documents and also from official records. Material will be supplied also by the district planning cells which will have to be set up under the control and guidance of the district collectors. Also where necessary, fresh information has to be gathered by means of direct investigation.

In drawing up programmes of development for each district, importance is to be attached to the proposals coming from village officers, the planning cells and local representatives and leaders, industrialists, agricultural experts etc. The state planning body should be in direct touch with these agencies, visit the villages in order to understand their problems and create in the villagers an enthusiasm for development work.

The facts and figures and the schemes for development put forward by the districts should be studied, scrutinised, checked and processed by the planning agency. Taking into account the total amount allotted for each district, priorities will have to be fixed for each sector, outlay is to be determined for each sector and the projects selected with reference to this allotment.

Adjustments with Sectoral Plans

The final stage in this exercise will be the meshing of the programmes drawn up for each district with the programmes drawn up for each sector by the heads of departments. Thus road construction programmes or projects concerning development of small industries or animal husbandry should be made to fit in with the programmes drawn up by the Public Works Department or the Industries Department or the Director of Animal Husbandry for the whole state This obviously imply adjustments to be made in district plans as well as sectoral plans. It is important to ensure that there is no duplication or overlapping. If this is done properly, the total cost of the different district schemes spread over the districts but coming under the same major head such as education or agriculture would add up to the cost figure indicated in the relevant sectoral programmes. The sum of the outlays on district plans and the plans relating to projects which are outside the scope of any particular district but which concern the state as a whole will represent the total size of the state's plan. □

Some Thoughts on the Sixth Plan

Kalipada Basu

APPARENTLY it is too early to discuss the sixth five year plan which is scheduled to be commenced on and from April 1, 1979 But our past experience shows that the drafting of a plan is not an easy task. The original draft of the fifth plan was prepared in a hurry. As a result, some changes of the original draft had to be made later, and the final plan was approved by the National Development Council in September, 1976, more than two years after the due date There is now a discussion on the nature, progress and limitations of the fifth plan. The gains of the earlier plans cannot be consolidated if the subsequent plan is not started in time

After 30 years of independence, and 25 years of planned economic development, the political conditions of the country have now changed. The new government is committed to re-examining the fifth plan. But three and half years of the fifth plan have already passed. It would, therefore, not be proper to spend more time by reopening the controversy on the fifth plan. We should, instead, concentrate on the sixth plan which will be significant in changed political situation. The Janata Party government is pledged to removing poverty and unemployment in ten years. The new government will have to draft the sixth plan to achieve its political objectives. The sixth plan is significant from the economic point of view, because even after long years of planning, extreme poverty prevails among the masses. It is stated in the fifth plan that the minimum consumption need of the masses, at the 1972-73 price level is Rs. 40.60, and this is said to be the poverty line. According to the findings of the Planning Commission about 30 per cent people of the country live below this poverty line. The percentage is much higher in the rural areas.

National Income not an indicator

It is true development has taken place in the last 25 years. According to an estimate the national income at 60-61 prices rose by 83 per cent from the beginning of the first plan up to the end of the fourth plan. It is expected that national income will increase by 22 per cent during fifth plan. The stress on the increase of national income, by any means, led to emphasis on heavy industries. But it should be noted that economic development and social justice are different things Rapid economic development or higher national income cannot remove poverty, if the increased income is not equally distributed among the masses. The increased production or income was not properly distributed among the people, and for this reason the poor remained poor and the rich became richer Besides, the heavy or the large industries are capital-intensive As a result, employment opportunities, proportionate to capital investment in these industries, were not created in the country. Industrial development was also concentrated in some urban areas.

If we sincerely desire to remove abject poverty the present outlook and policies will have to be changed, and the sixth plan drafted accordingly. We should remember the past lapses, the abject poverty of the masses and the changed political situation of the country while drafting the sixth plan.

We have to give top priority to agriculture (including irrigation), cottage and small scale industries, rural roads, electricity in rural areas and primary education. In our economy agriculture plays an important role About 68 per cent of the people of our country live on agriculture, and about 46 per cent of the national income comes from agriculture Agriculture also supplies raw materials to major industries of the country Cottage and small scale industries employ about two crore and 50 lakh people. Handlooms alone absorb, about 50 lakh rural people. Agriculture and small scale industries are labour-intensive and are decentralised. Transport and communication is a major bottleneck of rural development. The villages should be linked with the major business centres and towns. Construction of metalled roads in villages will automatically help develop the transport system. Electricity is necessary for the development of irrigation system, and cottage and small scale industries.

Even after 30 years of indepen dence about 70 per cent of the peopl are illiterate. Illiteracy is also on of the causes of poverty. It shoul be the policy of the Planning Com mission not to lay great stress o heavy industries in the sixth plan The aim should be not to expan the large industries, but to utilis the production capacity fully.

Order of Allocation

In the final draft of the fifth plar total outlay was estimated to be Rs 69,300 crore. On the basis of th doubling principle the total outla of the sixth plan should be aroun Rs. 1,38,000 crore. The fifth plar public sector outlay is estimated t be Rs. 42,300 crore, that is, 60 pe cent of the total outlay. In the fourt plan public sector outlay was 6 per cent. If we assume that the publi sector outlay in the sixth plan wil also be 60 per cent, then the tota public sector outlay in the sixth plan will be Rs. 83,000 crore. If we wholeheartedly want to fulfil the two main objectives of the sixth plan, as stated earlier, we will have to spend at least 75 per cent of Rs 83,000 crore on agriculture, irrigation, small and cottage industries, rural roads, rural electricity and primary education The total allocation on these six sectors will be about Rs. 62,000 crore Considering the relative importance of these sectors it is suggested that 40 per cent (Rs. 24,800 crore) should be earmarked for agriculture including, irrigation, 20 per cent (Rs. 12,400 crore) for cottage and small scale industries, 15 per cent (Rs. 9,300 crore) for rural roads, 15 per cent (Rs 9,300 crore) for rural electricity and 10 per cent (Rs. 6,200 crore) for education.

It should be mentioned here that in the fifth plan only 16 per cent of the total public sector outlay has been allocated for agriculture including irrigation. Only 3.3 per cent is earmarked for education Out of the total allocation for education only 32 per cent has been sanctioned for primary education In a country where about 70 per cent people are still illiterate, further expansion in the field of higher education is discriminatory against the people who are deprived of primary education. Higher education is also unnecessary in the present context of our economy. It is therefore, suggested that at least 75 per cent of the total allocation on education in the sixth plan (Rs. 4,650 crore) should be spent for the expansion of primary education. □

New Priorities

Virendra Agarwala

THE PRIME MINISTER has claimed that the Union Budget for 1977-78 provides a new direction that is sure to revive the economy and arrest the rising trends in prices It is also directed to solving the problem of rural unemployed and to boosting agricultural output. He is quite optimistic that it could improve the economy all round, the dependence on foreign assistance will decline and our efforts to create an atmosphere of Swadeshi are sure to bear fruit.

The share price index (base 1969-70-100) which rose from 137.2 on March 2, 1977 to 150.9 on the date of the budget declined to 150 0 in the post budget trading The hesitant mood in the share market shows a lack of firm activity; the bearish trend in share prices now witnessed may gather further momentum thus reflecting a rather cool reaction to the budgetary proposals The buoyancy in equity prices noticed during the pre-budget days was mainly due to the budget expectations But the budget proposal went against the investors' expectations and the market failed to react It is obvious that the share market experts have ignored some of the salient features of the budgetary exercises and the context of several constraints within which the Finance Minister was required to operate

The market has also felt indifferent to the concessions made available to the corporate sector. The share market seems to be particularly disappointed by the absence of any positive tax reliefs for the revival of industrial development, though the Finance Minister had emphasised the need for mobilisation of resources through saving for investment. The increased surcharge rate on personal incomes from 10 to 15 per cent has denied the tax payers the benefit of the higher exemption limit from Rs. 8,000 to Rs 10,000. The extension of the Compulsory Deposit Scheme further restricts the flow of savings into equity investment. The earlier expectation that the exemption of dividend income up to Rs. 250 from deduction of tax at source would give rise to larger investment, though in small lots, has been belied It is almost certain that the market would gradually settle down and stabilise around the current levels with some institutional support

The FICCI has expressed its disappointment over the budgetary proposals and has felt that they will have little or no influence on resolving the current economic problems facing the country's economy For quite some time, several industries have been languishing, the demand is not expanding, input costs have gone up, savings and investment rate is low and there is shortage of working capital and the interest rate is excessively compounded by high corporation taxation.

Extension of investment allowance, the modification to the Capital gains tax and tax facility to carry forward losses of sick units in case of merger will surely create some stimulus in the present difficult conditions The list of low priority industries includes a number of labour intensive industries which should be eligible for investment allowance The budget should have provided adequate assistance to industries suffering from low capital utilisation. As new industrial units are not in a position to compete because of steep increase in project cost, it calls for a reduction in import duties on capital goods, a more scientific application of excise duty rebate, lowering of the overall rate of corporate taxation and removal of taxation of inter-corporate dividends. It is also believed that the incentives for investment will be counter-weighed by increases in personal taxation of incomes and wealth as also the withdrawals of the benefit to companies of deposit of the surcharge with the IDBI.

Bleak Industrial Prospects

The Government leaders seem to be determined to bring about rural industrialisation but the budget has not indicated the clear guidelines which could have encouraged the entrepreneurs to move into the rural areas. The policy makers at the top have laid greater emphasis or introducing a law prohibiting big industry from entering areas where small scale units can do the job as well. Creation of future capacity would be tested on this touchstone alone. If this objective is to be pursued vigorously, the Finance Minister's claim that the growth rate in industrial production would be maintained at the previous year's level would be meaningless. The growing industrial unrest and poor prospects on the power front have made the industrial climate rather bleak There is a consensus developing gradually that the plan priorities need be so rearranged that decentralised, labour intensive-small industry based on local resources and simple technology could produce essential goods of mass consumption in the rural areas. It will not only generate employment potential but will also help in creating purchasing capacity among those now living below the poverty line.

The total plan outlay of Rs. 5,790 crore on the central account includes Rs 35 crore for khadi and village industries, Rs 20 crore for handlooms and Rs 4 crore for agriculture There are, of course, tax concessions favouring small units. Units producing up to Rs one lakh will be exempted from the new excise on hand and small tools, electric lights, fittings and polishes The increased general excise of two per cent will not apply to units not using power and to units with an annual turnover not exceeding Rs 30 lakh. Certain types of handloom yarn have been exempted from duty and such exemption has also been extended to the powerlooms. Small units making watches will get increasing concession The only important small industry that will bear a higher tax is the making of branded beedies but the additional tax burden will be very small.

The most important direct tax measure to help small industry as well as rural development is the rebate to be given to the small industrial units going to the rural areas after June 30, 1977. The other direct tax concessions like investment allowance or rebates for using indigenous knowhow are available to all qualifying industries irrespective of size. But in the field of small industry and rural development, fiscal policy will commonly be a (*Contd. on Page..*23)

SCHUMACHER ON BUDDHIST ECONOMICS

The keynote of Buddhist economics is simplicity and non-violence. From an economist's point of view, the marvel of the Buddhist way of life is the utter rationality of its pattern amazingly small means leading to extraordinarily satisfactory results... .....

For the modern economist this is very difficult to understand. He is used to measuring the 'standard of living' by the amount of annual consumption, assuming all the time that a man who consumes more is 'better off' than a man who consumes less. A Buddhist economist would consider this approach excessively irrational : since consumption is merely a means to human well-being the aim should be to obtain the maximum of well-being with the minimum of consumption. Thus, if the purpose of clothing is a certain amount of temperature comfort and an attractive appearance, the task is to attain this purpose with the smallest possible effort, the holp of designs that involve the smallest possible input of toil. The less toil there is, the more time and strength is left for artistic creativity It would be highly uneconomic, for instance, to go in for complicated tailoring, like the modern west, when a much more beautiful effect can be achieved by the skilful draping of uncut material. It would be the height of folly to make material so that it should wear out quickly and the height of barbarity to make anything ugly, shabby or mean.........

As physical resources are everywhere limited, people satisfying their needs by means of a modest use of resources are obviously less likely to be at each other's throats than people depending upon a high rate of use. Equally, people who live in highly self-sufficient local communities are less likely to get involved in large-scale violence than people whose existence depends on worldwide systems of trade......

From the point of view of Buddhist economics, therefore, production from local resources for local needs is the most rational way of economic life, while dependence on imports from afar and the consequent need to produce for export to unknown and distant peoples is highly uneconomic and justifiable only in exceptional cases and on a small scale......

Just as a modern European economist would not consider it a great economic achievement if all European art treasures were sold to America at attractive prices, so the Buddhist economist would insist that a population basing its economic life on non-renewable fuels is lering parositically, on capital instead of income. Such a way of life could have no permanence and could, therefore, be justified only as a purely temporary expedient . .

While many theoreticians-who may not be too closely in touch with real life-are still engaging in the idolatry of large size, with practical people in the actual world there is a tremendous longing and striving to profit, if at all possible, from the convenience, humanity, and manageability of smallness. This also is a tendency which anyone can easily observe for himself......

The conventional wisdom of what is now taught as economics by-passes the poor, the very people for whom development is really needed. The economics of gigantism and automation is a left-over of nineteenth-century conditions and nineteenth-century thinking and it is totally incapable of solving any of the real problems of today An entirely new system of thought is needed, a system based on attention to people, and not primarily attention to goods (the goods will look after themselves). It could be summed up in the phrase, production by the masses, rather than mass production .....

If we ask where the tempestuous developments of world industry during the last quarter-century have taken us, the answer is somewhat discouraging. Everywhere the problems seem to be growing faster than the solutions. This seems to apply to the rich countries just as much as to the poor...

The amount of real leisure a society enjoys tends to be in inverse proportion to the amount of labour-saving machinery it employs...

The prestige carried by people in modern industrial society varies in inverse proportion to their closeness to actual production...

The present consumer society is like a drug addict who, no matter how miserable he may feel, finds it extremely difficult to get off the hook. The problem children of the world-from this point of view and in spite of many other considerations that could be adduced-are the rich societies and not the poor...

The slogans of the people of the forward stampede burst into newspaper headlines everyday with the message, 'a break through a day keeps the crisis at bay'...

Any third-rate engineer or researcher can increase complexity; but it takes a certain flair of real insight to make things simple again...

The new thinking that is required for aid and development will be different from the old because it will take poverty seriously. It will not go on mechanically, saying: 'What is good for the rich must also be good for the poor'. It will care for people from a severely practical point of view. Why care for people? Because people are the primary and ultimate source of any wealth whatsoever. If they are left out, if they are pushed around by self-styled experts and high-handed planners, then nothing can yield real fruit...

The real task may be formulated in four propositions: First, that workplaces have to be created in the areas where the people are living now, and not primarily in metropolitan areas into which they tend to migrate ..

Second, that these workplaces must be, on average, cheap

ıough so that they can be eated in large numbers with- ut this calling for an unattain- ble level of capital formation nd imports.

Third, that the production ıethods employed must be re- ıtively simple, so that the dem- nds for high skills are minimi- ed, not only in the production rocess itself but also in matters f organisation, raw material ıpply, financing, marketing, nd so forth.

Fourth, that production should e mainly from local materials nd mainly for local use.

These four requirements can e met only if there is a 'region- l' approach to development and, econd, if there is a conscious ffort to develop and apply what ight be called an 'intermediate chnology'. These two conditions ill now be considered in turn . .

One sometimes wonders how ıany 'development economists' ave any real comprehension of e condition of the poor . . . .

The life, work, and happiness f all societies depend on cert- in 'psychological structures' hich are infinitely precious and ighly vulnerable. Social cohe- on, cooperation, mutual res- ect, and above all self-respect ourage in the face of adversity nd the ability to bear hardship- ll this and much else disintegra- s and disappears when these sychological structures' are ravely damaged. A man is estroyed by the inner conviction f uselessness. No amount of onomic growth can compensate r such losses-though this may e an idle reflection, since eco- omic growth is normally inhibi- d by them . . . .

The problem is not new. Leo olstoy referred to it when he rote : "I sit on a man's back, hoking him, and making him arry me, and yet assure myself nd others that I am very sorry r him and wish to ease his lot y any means possible, except etting off his back." So this is e first question I suggest we ave to face. Can we establish n ideology, or whatever you ke to call it, which insists that he educated have taken upon hemselves an obligation and ave not simply acquired a passport to privilege' ? . . .

—From *"Small is Beautiful"*

THE EVIL IS IN INDUSTRIALISM

There is a growing body of enlightened opinion in the west which distrusts this civilisation which has insatiable material ambition at one end and consequent war at the other...

"I do not share the socialist belief that centralisation of the necessaries of life will conduce to the common welfare when the centralised industries are planned and owned by the State. The socialistic conception of the west was born in an environment reeking with violence. The motive lying behind the western type and the Eastern is the same-the greater welfare of the whole society and the abolition of the hideous inequalities resulting in the existence of millions of have-nots and a handful of haves. I believe that this end can be achieved only when non-violence is accepted by the best minds of the world as the basis on which a just social order is to be constructed. I hold that the coming into power of the proletariat through violence is bound to fail in the end. What is gained by violence must be lost before superior violence ..

"Centralisation cannot be sustained and defended without adequate force. Simple homes from which there is nothing to take away require no policing; the palaces of the rich must have strong guards to protect them against dacoity. So must huge factories. Rurally-organised India will run less risk of foreign invasion than urbanised India well equipped with military, naval and air forces...

"You cannot build non-violence on a factory civilisation, but it can be built on self-contained villages. Even if Hitler was so minded, he could not devastate seven hundred thousand non-violent villages. He would himself become non-violent in the process. Rural economy, as I have conceived it, eschews exploitation altogether, and exploitation is the essence of violence. You have, therefore, to be rural-minded before you can be non-violent, and to be rural-minded you have to have faith in the spinning wheel . . . .

"Pandit Nehru wants industrialisation because he thinks that, if it is socialised, it would be free from the evils of capitalism. My own view is that the evils are inherent in industrialism, and no amount of socialisation can eradicate them......

"I shall work for an India in which the poorest shall feel that it is their country, in whose making they have an effective voice......

"When the Swadeshi mantra resounds in every ear, millions of men will have in their hands the key to the economic salvation of India. Training for this does not require hundreds of years...

"My views on national planning differ from the prevailing ones. I do not want it along industrial lines. I want to prevent our villages from catching the infection of industrialisation. American exploitation has added to the moral height neither of the exploited countries, nor of the exploiting country. On the contrary, it has impeded their march towards spiritual progress, and deadened America's real spirit of philanthropy. A phenomenon like the one that America witnessed cannot happen in India. I mean the destruction of tons of sugar and other agricultural products...

"When production and consumption both become localised the temptation to speed up production, indefinitely and at any price, disappears. All the endless difficulties and problems that our present-day economic system presents, too, would then come to an end ...

"I heartily endorse the proposition that any plan, which exploits the raw materials of the country and neglects the potentially more powerful manpower, is lopsided and can never tend to establish human equality....

Mahatma Gandhi

Inflation: Some General Information

L.G. Bapat

TO 'SAY that inflation is a rapid and substantial increase in prices is generally correct but not always According to Prof. A.P. Lerner, a price rise must be unforeseen and uncorrected. Then alone can it be called inflationary. If a price rise is anticipated, it can be counterbalanced by suitable changes in the rate of interest. So inflation means an unanticipated, rapid and substantial increase in prices above their normal level. Where there are no controls, this definition will hold good. Where controls exist inflation will reveal itself in long queues, black markets, hoarding, speculation etc.

Why does inflation occur? It occurs because the total demand for goods and services is in excess of their total supply. As imports are required to be ultimately paid with equivalent exports, it can be said roughly that we, as a nation, can consume only what we produce. When we *attempt* to consume more than what we produce, there is inflation. It has to be noted here that we cannot, in reality, consume more than what we produce. Therefore, it cannot be the *actual* consumption of goods and services in excess of their production that causes inflation. It is our *attempt* to do so which is the villain of the piece. It is in this sense that inflationary policies are said to be self-defeating In addition to failure, you end up with another ticklish problem on your hands, namely, how to stop prices from rising.

Thus, many developed countries with memories of the great world depression of 1929-33 fresh in their minds and under the influence of Keynes's "General Theory of Employment", attempted to implement policies of full employment. They tried to spend in excess of their resources. Welfare programmes were also chalked out and implemented which added further to the already heavy spending. On the other hand, developing countries like India, newly freed from the yoke of slavery, attempted to catch up with those with an early start in the economic sphere. They prepared blueprints of ambitious economic plans in their efforts to do in a few years what was done over many generations by the developed countries. They therefore, tried to invest more than what they could afford and landed themselves in "inflation". Thus, the malady soon captured practically the whole world soon after the second war Today, inflation has become a global phenomenon. Even the communist countries are not free from it.

How does inflation work itself out? The early economists discussed this problem from a purely monetary point of view. According to them, supply of money is the *only* cause of inflation Thus, Prof. Irwin Fisher in his "Quantity Theory of Money" arrived at the conclusion that if the quantity of money is doubled, the prices will also double Though later economists modified this theory to a certain extent, they maintained the basic idea intact. The only change they admitted was that the relation between the quantity of money and prices is not so exact Besides, Prof. Fisher had specifically pointed out that while calculating the supply of money, not only is the quantity of money issued by the Government to be considered but its velocity too. The effective supply of money is, therefore, equal to the quantity of currency in circulation *multiplied* by its velocity.

An increase in the supply of money may be a *major* cause of inflation, but certainly it is *not the only cause* as the classical economists seemed to believe. When first prices rise due to an increased supply of money, it raises the cost of production of various goods. Workers demand a higher wage as they find the maintenance of their usual standard of living difficult due to a rise in the prices of consumer goods. So also, the prices of raw materials go up. When thus, the cost of production goes up, to maintain their *usual* margins of profits, the entrepreneurs are forced to raise the prices of their products. In fact, the entrepreneurs would not now be satisfied with the usual margin of profit. A price rise hits them also and, to maintain their standard of living, they now need higher money profits. Hence, the price rise is more than in proportion to the increase in the cost of production.

This means that there is a fresh price rise which leads to a fresh demand for a rise in the wages. This vicious circle moves all over again. Thus, a price rise in one sector affects the prices in other sectors which react again on the former and lead to a further price rise there. The process soon becomes cumulative In this way, inflation raises its ugly head. The *Cumulative* nature of this process is known to be the most important character of inflation, for it indicates that there is no automatic end to this process. It also indicates that to put the process in reverse is an extremely difficult task.

Thus, when the supply of money increases, it raises the total effective demand in the economy and hence the price level. This is known as the demand-pull inflation in the economic jargon. When the cost of production rises, it leads to a rise in the price level. This is called the cost-push inflation. There is a third type of inflation known as administrative inflation in the USA. In oligopolistic economic units, the prices are administered, that is, fixed independently of the factors of supply and demand, in a discretionary manner. Here, the price rise takes place even though the supply of money and the cost of production remain unchanged.

Prof. Charles Schultz has formulated another theory of inflation He assumes that the prices and wages are flexible *only upwards*. In those sectors where the demand increases the prices increase. But the prices do not fall in those sectors where the demand falls, for, the prices are not flexible *downwards* according to his assumption. Thus, a fall in demand leads to a fall in production and employment and not in prices This means that the price level always tends to rise. It does not come down This is exactly what seems to be happening in the developing countries like India at present.

These are essentially purely monetary explanations of inflation The Swedish economist, Prof Hayek, pointed out that inflation is a symptom of disequilibrium in the economy. This disequilibrium

Shri Bapat is Head of the Department of Economics in Dayanand College, Sholapur.

Will it Eradicate Poverty and Unemployment ?

C. John

THE PEOPLE'S Plan II prepapared by the Indian Renaissance Institute founded by the late Shri M.N. Roy has aroused considerable interest just like the first People's Plan of 1944 by the same Institute. The People's Plan II 1978-79 to 1998-99 has projected a set of priorities different from the priorities of the five year plans that have been implemented in the country. Among the objectives of the Plan are the removal of poverty, generation of adequate employment opportunities and meeting the primary consumption requirements of the country's growing population

Considerable emphasis has been given to resource mobilisation for successfully implementing the Plan. On the basis of past experience it can be safely asserted that whatever be the target for resource mobilisation the government can realise it in view of its vast powers of taxation, possibilities of raising resources from the public sector enterprises by raising the prices or increasing the output; chances of market borrowings, and scope for external resources by trade or aid. On the basis of the working of the five year plans in our country it can be said that the most important aspect of planning is how the resources are utilised and how efficiently the plan projects are executed

If the planned investments in the People's Plan II are compared with those in the fifth five year plan it will be seen that there is less emphasis on industrialisation compared to the emphasis on social services, public utilities, housing for the poorer sections and agrarian economic conditions. The greater emphasis on agriculture is in tune with the Janata Party's policy though the People's Plan does not represent in any way the central government's thinking on the pattern of future plans.

Shri John is Post-graduate Professor of Economics, Scott Christian College, Nagercoil Tamilnadu

The total amount set apart for investment in agriculture in the first ten year period from 1978-79 to 1988-89 represents 15.28 per cent of the total plan expenditure while, in the fifth five year plan, the share of agriculture is only 11.82 per cent. Similarly for irrigation and flood control 13.26 per cent allotted while in the fifth five year plan only 8 76 per cent is set apart for the purpose. But when we consider the proposed investments in power generation and distribution there is a big fall from 18 56 per cent in the fifth plan to 10 26 per cent in the People's Plan At a time when the country is suffering from serious power shortages in several regions and after seeing the crippling effects of power shortages on agriculture and industry it is not possible to regard the low priority for power as a proper arrangement. In states like Tamilnadu, Punjab and Haryana, the progress of agriculture is very closely linked with the expansion of power supply Any slowing down of power development would seriously impede the progress of agriculture. If power development is regarded as a necessary part of agricultural development, the proportion allotted to this sector in the fifth five year plan is marginally higher than in the People's Plan.

Need for Industrial Development

The programme for housing the millions of poor people and the proposed expenditure on social services will definitely provide substantial additional employment and will improve the living conditions of people below the poverty line. For the success of these programmes cheap construction materials are essential and for mass production of these items the development of industry cannot be ignored. The development of agriculture also would mean an increase in the supply of inputs by starting factories for that purpose. Expansion of industry cannot, therefore, be accorded lower priority than at present.

It is emphasised in the People's Plan that the state will be increasingly involved in the provision of services and public utilities and will have relatively less to do with industrial growth. This idea may have to be abandoned in favour of a more pragmatic policy of the state entering any particular area where shortages appear because the private sector is unable to expand sufficiently due to either the huge capital cost involved or due to lack of dynamism The provision for transport and communications is placed at 14 21 per cent as against 17.51 per cent in the fifth plan. If the planned increases in agricultural production are not to result in gluts in certain centres as it happened in the case of wheat in Punjab and Haryana and in the case of potatoes in certain parts of Uttar Pradesh following a good crop, it is necessary to have adequate provision for the expansion of transport services

According to the People's Plan the major gains are to be in terms of basic necessaries and social welfare services. Eight items figure in the Plan targets: foodgrains, sugar, gur, vanaspati, tea, coffee, tobacco and cotton cloth. This is not an exhaustive list of basic ne essaries and there are more goods like edible oils and milk which will have to be included Even in these basic items for which shortages have been felt either throughout the last three decades or for brief periods, it should be realised that there were also periods when some of these goods could not find suitable markets for the entire supply For example, one of the problems with regard to handloom cloth almost continuously during the last 25 years and with regard to milk cloth in some years intermitently has been lack of adequate demand. It has to be seriously considered whether the generation of employment and improvement in the standards of life targeted for in the Plan will be adequate to create and sustain enough demand for these goods

The emphasis on small scale industry, while necessary for providing employment for large numbers, raises vital questions regarding the economic viability of the units in this sector. If they have to be always propped up by government subsidies and loans as in the case of cotton handloom industry or if they always work below capacity and produce things at high cost and depend on government help for their survival, they will only add to the burdens on the economy rather than

bring about its healthy growth.

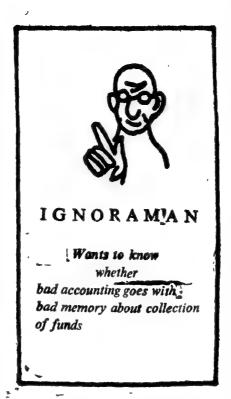
While, according to the population trend projection there will be 888.4 million people in the country, the target has been set at 834.6 million by 1998-99 in the Plan. How this target is to be achieved with the present hostility of the people towards the family planning programme is not clear. In the present context it is better to plan for the normal and natural increase of population. Once the assumptions regarding population growth go wrong all other expectations regarding standard of life also will be upset. If there is any time-bound programme for limiting the population growth, it will kindle the wrath of the people. A voluntary family planning programme will take several decades to make its impact.

In view of all this, it is possible to conclude that the People's Plan may not be able to eradicate poverty and unemployment in the country in the near future. Top priority will have to be given for family planning and the plan should aim at balanced growth of industry, transport and agriculture. □

INFLATION

(Contd from Page..21)

is due to the non-realisation of the expectations It results in real changes in the production and consumption which are not anticipated and hence not intended by the people who undergo them. Thus, workers are attracted by the higher *money* wages and they, therefore, prefer to work harder to enjoying their extra time as leisure, in the hope of raising their standard of living. If they would have been fully aware of the falling purchasing power of their money wages, they would not have probably behaved like this. Thus, to quote Prof. Lerner again, **the people are induced to do things other than what they really intend** (Emphasis original). These real changes constitute inflation, according to Prof. Hayek.

In conclusion, it may be said that no single factor, by itself, creates inflation. All these factors – the excess supply of money, the rising velocity of money, an increase in the cost of production, administered prices, the rigid price structure, and the real changes in the economy – acting together lead to the inflationary conditions. Naturally enough, to control inflation, we shall require simultaneous action on all these fronts To control the velocity of money, the cooperation of the people will be required for. If people saved more, the velocity of money would automatically fall. To control cost-push inflation, the cooperation of workers is necessary for, they would have to increase production at least in the same proportion in which their money wages go up To control administrative inflation, the cooperation of the entrepreneurs would be essential. To expect the government alone to control inflation is to expect the impossible. □


DEMOCRATIC PROCESS-4

(Contd from Page..13)

A weak government, in the words of Burke, is the worst tyranny of all times. It, therefore, becomes essential to provide a proper balance between the needs of effective government and equally effective safeguards against the abuses of administration. It is in the latter context, the context of effective safeguards against the abuses of administration by violation of the provi sions of Constitution and the laws, that the courts come into the picture.

The courts are not, as is sometimes said, stumbling blocks in the way of socio-economic reforms. Their functi on only is to ensure that there is no contravention of the Constitution in the framing of the laws and no contravention of the Constitution or the laws in the process of implementation of the laws by the executive.

Once that is understood we shall appreciate the role of the courts as one of the necessary pillars to support the democratic edifice. □

COMMENTS ON BUDGET

(*Contd. from page..17*)

part of a combined programme of consultancy service, credit facilities, input supply and marketing. The new shift has been widely appreciated but the conflicting statements made by the top leaders have not quite contributed to clarity.

Primacy of Agriculture

The Janata Government is committed to a clean sweep of the Congress government's economic policies and programmes and to evolve new ways for improving the living standards of the vast mass of people. The sixth plan is sure to reflect the Janata Party Government's thinking and priorities. The Janata Party leadership has recognised the primacy of agriculture which implies that the investment requirements of agriculture would be given the highest priority. It clearly means a new direction to the system of planned development. The new government has made increase in agricultural productivity the sheet-anchor of its programme to remove poverty, enlarge employment opportunities and reduce disparities. The budget may not wholly reflect these policies but its formulations are surely in the right direction. The new phase will be marked by a definite shift in terms of strategy and priorities from basic industries in the public sector to agriculture, from centralised planning to district planning and from growing beggary to full employment to all. If planning is to be effectively employed, then the available resources must be properly utilised. Pure drinking water should be made available to all rural areas and the rate of annual expansion of the area under irrigation should be doubled within the next five years. Large scale industrialisation in the rural areas is the key to economic prosperity. Therefore, the budget has rightly formulated priorities which are sure to inculcate a new spirit of self-employment through the process of medium technology in rural areas. □

A Perspective of Elementary Education in Bihar

Dr. G.L.P. Yadava

BEFORE ATTEMPTING a perspective of elementary education for Bihar some important points must be borne in mind. Education is a state subject whereas the allotment of finance to execute the programmes of this sector is approved and finalized by the central government keeping in view the allocations to other states. Secondly, planning in the Centre as well as in the states is an indirect sort of planning in which we try to influence the behaviour of individuals in the desired manner so that the target set may be achieved. The behaviour of the individuals may not be influenced in the desired manner due to various reasons and the targets fixed may not be achieved. We cannot dictate the private individuals under the present framework of Constitution that the targets fixed have to be achieved anyhow. Thirdly, in the past the social services sectors including education have been assigned a comparatively low priority and hence the funds allocated to these sectors are generally insufficient to meet even the minimum needs. The planning experience in our country including Bihar shows that even the insufficient funds allocated are not actually spent over the specified sector like education; they are diverted to some 'core sectors'. These factors naturally have great bearing on planning elementary education in Bihar for which a perspective is attempted below.

Article 45 of the Directive Principles of the Indian Constitution provides that all children in the age-group 6-14 should have *free and compulsory education by* 1960. That year has gone without our being anywhere near the target. Even without the constitutional obligation, it can be shown that the socio-economic benefits of elementary education are many times its cost The benefits will have to be scientifically quantified or at least scientific attempts made to quantify the benefits of spread of literacy, functional literacy of workers in farms and factories, broadening the foudation of further learning, better utilization of material resources etc.

Taking everything into account, the following targets of enrolment may be set for Bihar.

This implies that an additional 54.51 lakh children in primary schools and 35.80 lakh children in middle schools would have to be enrolled during the next two five year plan periods to attain 100 per cent enrolment of children in the age-group 6-11 and 80 percent enrolment in the age-group 11-14 Enrolment of girls has to be given a special emphasis in the years to come.

Requirement of teachers

On the basis of enrolment proposed, the requirement of teachers in schools has been estimated taking into account the existing norm regarding the teacher-pupil ratio, that is 1:40 and two other norms which-ever may be considered desirable depending on the availability of resources—men, material and finance. Other two norms for the teacher-pupil ratio considered are 1:30 and 1:25. The following table gives the requirement of teachers based on different norms:

Thus on the basis of the teacher-pupil ratio of 1:25 nearly 4.5 lakhs (5.99-1.5) additional teachers would be required by the end of the seventh five year plan. Even if it be 1.40, the additional requirement would be 2.25 lakh teachers. If the requirement of teachers on account of death, resignation, retirement etc, is also taken into account, the need works out still to a large number of teachers At the modest rate of 2% per annum this additional requirement in the base year 1973-74 would be nearly 3,000 teachers and in 15 years' time it would certainly be more than

Dr. Yadava is Industrial Economist in the Bihar Government.

*The views expressed in this paper are of the author, not of the institution he serves.

TABLE I

(*Enrolment in lakh*)

Year	Enrolment in the age group					
	6-11 (Class I - V)			11-14 (Class VI - VIII)		
	Boys	girls	Total	Boys	girls	Total
1978-79	44.44	22.00 (55.5)	66.44 (81.1)	15.47 (65.0)	4.46 (20.0)	19.93 (43.0)
1983-84	4 .50 (100.0)	45.70 (100.0)	85.68 (100.0)	22.28 (80.0)	9 87 (38.4)	32.15 (60.0)
1988-89	53.60 (100.0)	49.47 (100.0)	103.07 (100.0)	30.17 (100.0)	16.54 (58.3)	46.71 (80.0)

N.B. Figure for other years have been calculated on the assumption that the age-structure of the population remains what it was in 1973-74. Figures in brackets represent percentage.

;,000. Therefore, in the years to)me and before the year 1988-89 ihar has to plan for getting not less ıan 2.7 lakh additional trained ;achers, if not 5 lakh.

At present the State has 112 ementaıy teacher colleges, each ıroling about 100 students. There re some dropouts and failures. Thus ıe outturn of trained teachers from ıese institutions is nearly 8,960 er annum. Even ıf it is assumed ıat they do not migrate to other tates, in 15 years period the State ould have an additional supply of early 1.3 lakh teachers, leaving a ap of at least 1.4 lakh teachers. ın another norm, the gap would be f the order of 3.7 lakhs.

The methods of meeting this addi- onal supply of trained teachers ıay be many. In any case, opening f new elementary training colleges would not be advisable because after 100 per cent enrolment is achieved, those institutions will be superfluous. Therefore, the system of double shifts increasing the number of trainees in a batch, condensed course of training (for instance, 6 months' course in place of the present lengthy course) may be considered. Planning this would require a lot of data which have to be collected.

School rooms

On the basis of the additional requirement of teachers, the additional class-rooms required by 1988-89 may be calculated. In spite of best efforts, about 35 per cent of the primary schools and 40 per cent of the middle schools in the State do not have buildings of their own There were 48,006 primary schools and 8,385 middle schools in Bihar in 1971-72. On this basis the backlog of buildings for primary schools comes to 16,802 and for middle schools 3,354. Thus there is a total backlog of 20,156 buildings.

Besides the existing backlog of nearly 20,000 buildings, as per the existing norm of providing one classroom for one teacher, the additional classrooms required will be at least 2.25 lakhs on the basis of 1:40 teacher-pupil ratio and five lakhs on the basis of 1:25 ratio by the end of 1988-89.

As has been mentioned in the beginning of this paper, the State Government has always assigned a low priority to elementary education.

At 1973-74 prices the salary to the teachers may be calculatted at the rate of Rs 300 per month which totals to Rs 3,600 per annum. Besides this salary amount, Rs 400

TABLE II

Requirement of Teachers in Elementary Schools in Bihar (1978-79 ··· 1988-89)

(*in lakh.*)

Year	Teacher-pupil ratio	Teachers required		
		Classes I-V (primary Schools)	Classes VI-VIII (Middle schools)	Total
	1:25	2.66	0.80	3.46
1978-79	1:30	2.21	0.66	2.27
	1:40	1.66	0.50	2.11
	1:25	3 43	1.29	4.72
1983-84	1:30	2.86	1.07	3.93
	1:40	2.14	0.80	2.94
	1:25	4 12	1.87	5.99
1988-89	1:30	3.44	1.56	5.00
	1:40	2.58	1.17	3.75

N.B. The total number of teachers in the primary schools in Bihar was 99,199 and in the middle schools 50,360 in 1973-74. The total of the two figures above comes to 149,559 or say 1.5 lakhs

TABLE III

Total funds needed for appointment of additional teachers (per the norm 1:40 T.P.R.) and cost of construction of classrooms (additional) during the 5th, 6th and 7th plan

(*Rs. in lakhs.*)

Five Year plan	Additional teachers to be appointed 1:40	Salary cost	Construction of classrooms		Total cost	
		[illegible]	@ 5000 per room	@ 1000 per room	Figs. in 3 plus 4	Figs. in 3 plus 5
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Fifth Plan	61,000	24,40	30,50	610	54,90	30,50
Sixth Plan	83,000	33,20	41,50	830	74,70	41,50
Seventh Plan	81,000	32,40	40,50	810	72,90	40,50

per annum per teacher may be taken into account for, medical benefits etc. Roughly the payment will come to Rs 4,000 per teacher per year. In Bihar, generally the teachers are appointed in the last year of the five year plan period. Obviously this is not a desirable thing. However, for the sake of economy and based on the past practice the cost of teachers' appointment may be calculated only for one year, that is the last year of each of the five year plan periods. Similarly, the cost of construction comes to nearly Rs 10,000 per room but if loca/buil- materials are used in roomsl raw dings in place of cement, iron etc. the cost of construction will come down to Rs 5,000 per room. If thatched huts are constructed, the cost of construction may come down to even Rs 1,000 per room but this type of classroom is less durable and the annual maintenance cost will be very high. Therefore, initially Rs 5,000 has been taken as the cost of construction per classroom. There may be some pu ca construction and there may also be some thatched huts but the average Rs 5,000 will take care of these deviations. Alternatively, if all classrooms are constructed using local raw materials, the cost per room may be Rs 1,000 only. The cost of construction has been calculated on these two alternative figures.

Taking into account the backlog of 20,000 buildings the provision for the fifth plan will go upto nearly Rs 38.5 crores as against the original provision of Rs. 91.98 crores including the MNP component estimated in the plan. Similarly during the sixth and seventh plans the estimated requirement of funds for Elementary Education schemes as proposed above will be at least 41.5 and 40.5 crores respectively. The cost may go up to 74.7 and 72.9 crores of rupees respectively. The cost may go up to 74.7 and 72.9 crores of rupees if another alternative of constructing the classrooms is opted for.

Incentive for Students

Besides meeting these costs, there are other problems which must be effectively dealt with, otherwise the increase in enrolments will not have the desired effect. Among these problems, the problem of dropout is the most serious problem. In Bihar out of each 100 students who enter the primary education stream, hardly 22 of them reach the class V stage. Problems like bogus enrolment, neglected girls' education, quality improvement, training of untrained teachers, worsening teacher-pupil ratio, apathy of the parents to send their children to schools etc. deserve our urgent attention Additional funds will have to be made available for taking up these schemes.

It should be noted that under the present laws the State Government cannot force the parents to send their children compulsorily to the school and hence the behaviour of the parents as well as children will have to be influenced by adopting certain schemes like free text books provision, provision of mid-day meals provision of school dresses free of cost to at least certain groups of students, provision of sports' facilities etc. Mere appointment of additional teachers and the construction of additional classrooms will not attract the children to schools in a state like Bihar or for that marte any state in Ind ia and other developing countries unless this is accompanied by incentives for continued stay of children in school. □

Yojana Quiz

What are Dog days?

Author of the Law of Falling Bodies is:
(a) Galileo
(b) Isaac Newton
(c) F. Soddy

Does a river ever flow from the sea into the land?

"To-day machinery merely enables a few to ride on the backs of millions The impetus behind it all is not the philanthropy to save labour, but greed It is against this constitution of things that I am fighting with all my might". Who said this?
(a) Karl Marx
(b) Mahatma Gandhi
(c) M. N. Roy

If the earth is a ball, why does an earthquake shake only part of it?

How does the milk get into the coconut?

SWERS

1. These are the days about the rising of the Dog Star, the hottest per of the year in the northern hemisphere. Roughly they are betw July 3 and August 25.
2. Galileo in 1590
3. At Argostolion, the Capital of Cephalonia, one of the Ionian isla off the West Coast of Greece, there is a phenomenon which practic amounts to this

   On the West side of the harbour is a stream of sea water wh flows at two miles an hour for about 150 feet inland, and then appears amid clefts and fissmes in the limestone rock. Where water goes to is a mystery.
4. (b) Mahatma Gandhi.
5. The earth is made of a great many different parts, including a c of many layers, it is quite possible for that reason to have a disturba somewhere that shook one of these layers against another, with shaking the whole body; and that is the kind of disturbance we earthquake and not an earth-shake.
6. The stuff that is called milk of coconuts is not milk, and has noth about it all like milk, except its appearance. The milk of the coco is simply a fluid formed by the tissue of substance of the nut, and we need not ask how it gets there.

Soviet Economic Assistance

USSR and Developing Countries *by A. Kodachenko; Perspective Publications Pvt. Ltd., New Delhi; Pages 88; Price Rs. 6.*

THIS booklet by a Soviet research scholar working at the Institute of World Economy and International Relations of Moscow, deals with the massive assistance given by the USSR and other socialist states to the developing countries for the rebuilding of their economy and thereby ensuring their economic independence The growing relationship between the Third World and the socialist countries led by the USSR is everyday becoming a decisive factor in the world of today.

In their just struggle the developing states enjoy the support of the Soviet Union and other socialist countries. This is given to them not for any temporary ad hoc reasons. This support stems from the principles underlying Soviet foreign policy

Today the developing states have the possibility of seeking a change in international economic relations such as would make them mutually advantageous for all sides. In extending and deepening their economic ties with the socialist countries, the developing states acquire a powerful means of influencing the imperialist powers and forcing them to make certain concessions. This concerns, first of all, the terms for the granting of aid, credits and the lifting of discriminatory measures in trade.

In a good number of countries the enterprises built with Soviet assistance form the basis of the national economy. Nine-tenths of the volume of economic and technical assistance from the Soviet Union goes into the production sphere, including more than three-fourth, into industry and power generation.

As a rule, the USSR helps the young states to build large industrial plants, pre-eminently in the public sector, which form the core of the relevant branch and the foundation for expanding allied industries. This enables the recipient countries to progressively cut down the import of foreign components and to improve their foreign balances position.

The economically less developed countries of Asia, Africa and Latin America are helped by the Soviet Union primarily in the development of manufacturing light and food industries and agriculture, that is, the industries which give the quickest returns and meet the most vital and urgent needs of the people.

Unlike the capitalist states which have been the "aid-givers" traditionally, the Soviet Union does not own a single project built with its cooperation and has no control over any of them.

As of January 1, 1976, a total of 507 projects, including 208 industrial plants, have been commissioned in the newly independent states with the help of the Soviet Union

How was this historical relation engendered? How did it take shape? What constitutes its basis? What has it in store for the liberated peoples? The author has successfully tried to answer all these questions, with facts and figures, in the booklet.

The development of ever new, diversified, and stable contacts between the developing countries and socialist states brings about new forms of the international division of labour during which the progressive system of international economic relations is undergoing a qualitatively new test.

Books

Industrial Finance

Readings in Industrial Finance *edited by Dr. L C. Gupta; The Macimillan Co. of India Ltd., Delhi,* 1976; *Pages viii* + 421; Price *Rs.* 68.

THESE edited papers are primarily meant for the use of college students and, therefore, have been culled from different original sources. The social perspective of the private sector given as the last section of the classified contents starts with a chapter on 'Concentration of Economic Power' by R.K. Hazari in his well known book *The Corporate Private Sector: Concentration, Ownership and Control*, 1966. This is followed by an extract from Gunnar Myrdal's *Asian Drama* (1968) on 'Operational Controls over the Private Sector'. J K. Galbraith's Study *The New Industrial State*, 1967 supplies another excerpt, entitled "The Future of the Industrial System'. These chapters are best read with chapter 14 on 'Organisational Framework for Implementation of Social Objectives', being a summarised version of a Report of a Study Group of the Reserve Bank, 1969.

The book contains 24 other papers categorised under capital market, entrepreneurship, commercial banks, development banks, securities market and foreign private investment. The organisation of the topics with brief editorial introduction to the papers might have been done through a proper introduction rather than in the present manner of prefacing them with a few introductory lines. There is apparently a mix-up in the arrangement of papers and the lack of a subject index adds to the confusion of the readers. The purpose of this collection of papers/extracts might have been better served if the historical accounts had been separated from the present developments in the field of industrial finance.

The reader is forced to conclude that there is yet another instance of using the student's name for bringing out a set of ill-coordinated and ill-edited papers for palpable commercial purposes. It is to be hoped that the author will bring out a closely reasoned study on the topic to suit the present day readership rather than this hotch-potch in the name of 'Readings'. And for this task, the earlier works offer the premise. This book is too highly priced for the students' pocket as well.

PHILIPS
For Factory Lighting that's Scientific
To boost up productivity, the lighting in your factory must be just right—even, effective and yet without glare.
To meet these needs, Philips makes a variety of energy-saving lamps and luminaires according to the highest international standards.
Also of great use to industry is the Philips Reflectalite which delivers more light where it's needed, even in dusty conditions. Philips luminaires are rugged in design for long-lasting service.
Full value for money.

Development Notes

FCI Projects to be Completed by 1978-79

The Fertiliser Corporation of India is poised for more than doubling its installed capacity of 7 lakh tonnes of nitrogen by the end of 1978-79. In the same period the installed capacity for P_2O_5 would be expanded by more than ten times, from the present modest capacity of 36,000 tonnes.

A special feature would be the commissioning of two of the country's first coal-based plants at Talcher and Ramagundam during 1978-79. The FCI is already using naphtha, natural gas, power and coke oven gas as feedstocks in its present operating units.

The FCI which at present mainly produces straight nitrogenous fertilizers, with the exception of the Trombay Unit where a complex fertilizer (Suphala) is also being produced, shall also now be producing Tripple Superphosphate at the Sindri Rationalisation Project (1977-78) alongwith additional quantities of phosphatic fertilizers at Trombay IV (1977-78) and in Haldia (1978-79)

During the current financial year (1977-78) the Sindri Rationalisation, Nangal Expansion and the Trombay IV projects would be commissioned, increasing the present installed capacity of 9 lakh tonnes of nitrogen to 11.3 lakh tonnes of nitrogen and 36,000 tonnes of P_2O_5 to 2.61 lakh tonnes respectively.

In 1978-79 apart from the two coal based plants at Talchar and Ramagundam, Haldia and the Sindri Modernisation projects, based on fuel oil, would also be commissioned.

The overall increase in installed capacity during 1978-79 would, therefore, be 7.5 lakh tonnes of nitrogen and 75,000 tonnes of P_2O_5, thereby raising the total installed capacity of the Corporation's units to 1.8 million tonnes in terms of nitrogen and 3.30 lakh tonnes of P_2O_5

The Trombay V project, based on the use of Associated gas from the Bombay High, is likely to be commissioned by 1980. The plant has been designed to use naphtha gas as alternative feedstock This plant is being designed to produce 2 27 lakh tonnes of N per year.

Rural Electrification in Arunachal

A giant hydel project having 1500 KW capacity has been inangurated at Kitpi of Tawang Sub-Division in Arunachal Pradesh. This biggest power project in Arunachal Pradesh will help electrify 113 villages in the rural areas of this sub-division. It will also help establishment of factories mills and industries. At present electrification work is going on in full swing in Lumla area and thereafter similar electrfication will be made in Zamithang, and Sengajong. Besides, this hydel project will also feed a number of Army Units and boost agricultural production.

FEDO Takes up Endosulphan Project

An agreement has been entered into between Hindustan Insecticides Ltd. and FEDO under which FEDO will give consultancy services for the Endosulphan project of HIL at Udyogamandal. The project will cost around Rs. 7 crore. FEDO will, in addition to checking the engineering designs and overseeing the construction of the principal plant, be responsible for the complete engineering procurement and construction supervision of the off-site facilities and township and overall project administration. This is the third major pesticides project that HIL has entrusted to FEDO in the recent past.

Endosulphan is used as an insecticide for paddy, vegetables, fruits etc. replacing endrine because it has got certain advantages over endrine. It is less toxic to human beings than endrine. It is not harmful to bees.

Both endosulphan and endrine are now being imported. The annual production capacity of the new plant will be 1600 tonnes. The foreign exchange savings on account of this new project will be to the tune of Rs. 8.5 crore a year.

New Groundnut Variety Released

A spreading variety of groundnut namely M-13 developed by the Department of Plant Breeding of the Punjab Agricultural University has been released for cultivation throughout the country.

M-13 was tested in the co-ordinated varietal trials for four years at 12 locations throughout the country and invariably showed an average increase of 12 to 41 per cent over the best varieties of the regions. Its seeds are bold and very much suited for export. It has a wide adaptability.

The variety has an average yield potential of 30 quintals per hectare and there is a great demand for its seed. The Vanaspati Manufacturers' Association has shown its willingness to purchase any quantity of this groundnut variety produced in Punjab at a premium of 10 per cent or at Rs. 250 per quintal whichever is more.

In order to get the maximum yield potential, M-13 has to be planted before 20th June when it gets 130 to 135 days for full maturity. Before planting, care should be taken to see that the seed is duly treated with thiram fungicide and 44 kgs of kernels should be used for one acre

India Ranks Ninth in Steel Production

India pushed back four countries in steel production during 1976 to emerge as the ninth largest steel producer in the world. India ranked only 13th in world steel production in 1975. The countries which India has overtaken in terms of total production are South Africa, Canada, Belgium and Spain. What is more significant about Indian steel industry is that the growth in production during 1976 was the second highest during the year, only Brazil having recorded a growth rate of 22 per cent while India recorded a growth rate of 21 per cent.

The growth rate of all other countries in the world during the year under review ranged from two per cent to 0.8 per cent only. The main factor for the high growth rate in steel production in India is the high capacity utilisation by all the plants. Other contributing factors were better technological discipline, research and development efforts in increasing equipment availability and good industrial relations. The public sector steel plants registered an appreciable improvement in productivity during 1976-77. The plants at Rourkela and Durgapur registered an improvement of 11 per cent each over the previous year's figure of ingot tonnes per man year.

The country's total exports of steel during 1976-77 were valued at Rs. 331.9 crore, three times more than in 1975-76. This has made the country a net exporter of steel for the first time.

Record Sugar Production

Uttar Pradesh this year produced 14.75 lakh tonnes the second record production of sugar as against 11.66 lakh tonnes last year. The area under sugarcane production was 28.70 lakh acres as against 30 lakh acres last year. The sugarcane production was 536.60 lakh tonnes as against 503.24 lakh tonnes last year. All the 79 sugar factories—51 in the joint or private sector, 10 in the cooperative sector and the rest under the sugar corporation—had produced more sugar. Two factories—Nadahi in Naini Tal and Hardwaganj in Aligarh district—both in the co-operative sector had started production in the current crushing season. The increase in sugar production was mainly because of several schemes launched by the department. Sugar recovery had also improved from 9.5 per cent to 9 71 per cent.

BHEL Bags Major Saudi Contract

The State-owned Bharat Heavy Electrical Limited (BHEL) has bagged a prestigeous £74 million export contract in Saudi Arabia for the electrification of a whole city on a turnkey basis. This is for the first time that an Indian company has been awarded a contract that too on a turnkey basis in Saudi Arabia.

The contract which has been secured against stiff international competition largely from the developed world marks a major breakthrough for India in its overall export effort. Under the contractual agreement the BHEL is to take up the electrification of the city of Wadi Jizan which envisages the construction of a 35000 kv power station with a diesel base, establishing a transmission network and construction of four sub-stations of 33/13.8 kv each. While the four sub-stations will be designed to supply power to 13 8 kv. distribution network, the construction of 220/127 volts network would also be undertaken The agreement envisages that the BHEL would have to complete the entire project within a period of two and a half years time from the date of the formal signing of the agreement.

IPICOL's New Units

The Industrial Promotion and investment Corporation of Orissa Ltd. (IPICOL) has sponsored three export-oriented processing and freezing plants to tap the vast marine potential of the state.

The corporation will also undertake merchant banking and preparation of a feasibility report for the three projects-Golden Dragon Seafoods Factory Private Ltd., Kalinga Agro Marine Pvt. Ltd., and Paradeep Marine Ltd., It will provide infrastructural facilities to these plants. Their total outlay is about Rs. 1 crore.

The Golden Dragon Seafood will have a freezing capacity of 5.5 tonnes per day, and an ice plant with a daily capacity of 10 tonnes. IPICOL and OSFC have sanctioned term loans for this project, the cost of which will amount to Rs. 41 lakh The factory building is nearing completion at Paradeep

The Kalinga Agro Marine Project, with a capital outlay of Rs. 28 lakh is coming up at Paradeep. It will be a servicing type of industry where shrimps, landed by a loading seafoods exporting company, will be processed.

Paradeep Marine Ltd., has a capacity of 5 tonnes per day for freezing, 10 tonnes daily for the ice plant, 50 tonnes fresh fish-cum-ice store and 150 tonnes frozen store It is coming up in Bhubaneshwar. The total outlay is Rs. 32 lakh. This plant will process the smallest variety of shrimps.

Phulpur Unit By Mid-1979

The Rs. 168 crore Fertiliser Project at Phulpur is likely to be commissioned in the first half of 1979 with a production of 30,000 bags of urea per day.

The project, which is being set up with the assistance of two internationally-famed firms will have a capacity of 5,00,000 tonnes of urea, when in full production

Part of the project's cost will be financed by a World Bank loan of £109 million.

A unique feature of the Phulpur fertiliser project, will be a farmer's training institute along with a highly developed farm of about one hundred acres.

The institute, which is under construction along with the fertiliser plant, will have an auditorium, an exhibition hall, rooms for classes and hostels for lodging.

Nuclear Power Stations

The second unit of the Rajasthan Atomic Power Station at Rana Pratap Sagar is expected to be commissioned by the end of this year. The second unit will have a capacity of 200 MW. The first unit of this station and Tarapur Atomic Power Station in Maharashtra are already under operation.

Four other atomic power stations are proposed to be set up in the country during the coming year The first unit of atomic power station at Kalpakkam in Tamil Nadu with a capacity of 235 MW is likely to be commissioned in 1979 and the second unit of equal capacity two years later Two units of the atomic power station at Narora in Uttar Pradesh are expected to be commissioned in 1982 and 1983 respectively.

Horlicks

The nourishment that builds resistance, safeguards health day after day.

Horlicks, taken regularly, gives your family the nourishment that builds up their resistance and keeps them full of health. Health that means success and happiness. Health that keeps you fit and active and builds security.

Horlicks...It's the only one that doctors all over the world recommend. The only one that gives so much nourishment because its rich, pure ingredients are combined by the unique Horlicks process which retains their natural goodness and makes them easy to digest.

That's why Suchitra has made Horlicks a part of her family's life. She knows that Horlicks gives them health protection.

Like Suchitra, give your family Horlicks every day and watch them grow in health and strength through all the years ahead.

"Horlicks is a prime source of nourishment. It has given consistent goodness through the years. I recommend Horlicks to build up your family's resistance and keep them healthy and active day after day."

HORLICKS-The Great Nourisher.

Horlicks is a Registered Trade Mark.

A PROPHECY COME TRUE

"I have known governments lose their heads; I have know a reign of terror being brought about; I have known the best, the noblest Indians, the highest characters amongst us brought under suspicion, standing in hourly dread of the visitations of the C I D. When Government undertakes a repressive policy, the innocent are not safe the innocen then is he who forswears politics, mumbles his prayer and *salaams* all officials . "

"There will be such a lowering of the public spirit, there will be such a lowering of the political tone in the country that all your talk of responsible government will be mere mockery

"You may enlarge your councils, you may devise wide electorates, but the men that will then fill your councils will be toadies and timid men, the bureaucracy armed with these repressive powers will reign unchecked under the outward forms of democratic government

"Much better that a few rascals should walk abroad than that an honest man should be obliged for fear of the law of the land to remain shut up in his house, to refrain from the activities which it is in his nature to indulge in, to abstain from all political and public work

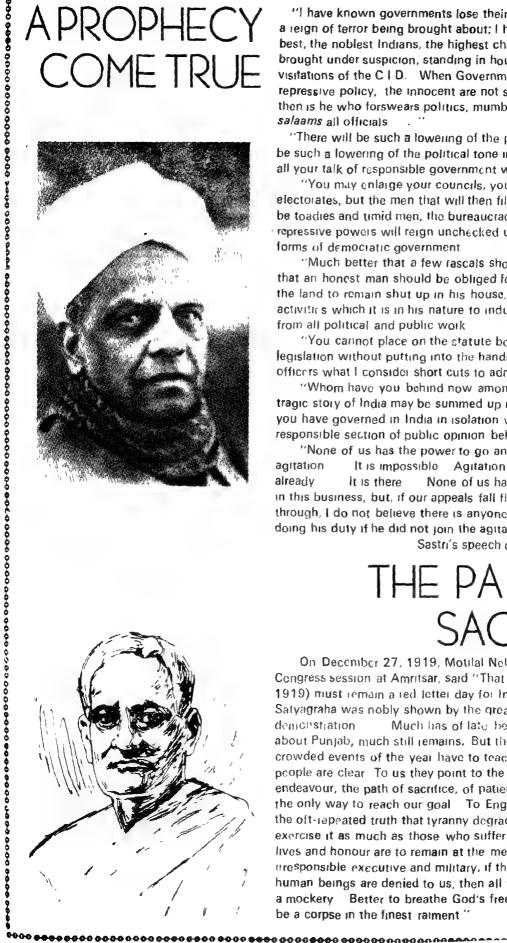
"You cannot place on the statute book such drastic legislation without putting into the hands of over-enthusiastic officers what I consider short cuts to administrative peace .

"Whom have you behind now amongst Indians? The tragic story of India may be summed up in these words that you have governed in India in isolation without having any responsible section of public opinion behind you

"None of us has the power to go and stir up a violent agitation It is impossible Agitation must be there already It is there None of us has had a share yet in this business, but, if our appeals fall flat, if the Bill goes through, I do not believe there is anyone here who would be doing his duty if he did not join the agitation "

Sastri's speech on the Rowlatt Bills

THE PATH OF SACRIFICE

On December 27, 1919, Motilal Nehru addressing the Congress session at Amritsar, said "That day (6th April, 1919) must remain a red letter day for India The spirit of Satyagraha was nobly shown by the great and peaceful demonstration Much has of late been said and written about Punjab, much still remains. But the lessons which the crowded events of the year have to teach us and the English people are clear To us they point to the path of steadfast endeavour, the path of sacrifice, of patience and deed, that is the only way to reach our goal To Englishmen, they teach the oft-repeated truth that tyranny degrades those who exercise it as much as those who suffer under it If our lives and honour are to remain at the mercy of an irresponsible executive and military, if the ordinary rights of human beings are denied to us, then all talk of reforms is a mockery Better to breathe God's free air in rags than be a corpse in the finest raiment "


THE ANSWER TO INSOLENCE

In June 1920, Mahatma Gandhi wrote in *Young India,* "No country has ever risen without being purified through the fire of suffering English and French histories are replete with instances of men continuing the pursuit of their right irrespective of the amount of suffering involved Why should we expect to write our history differently. . The frightfulness at Amritsar drew away public attention from the greater, though slower, frightfulness at Lahore where an attempt was made to emasculate the inhabitants by slow processes But before we rise higher, we shall have to undergo such processes many more times till they teach us to take up suffering voluntarily and to find joy in it I am convinced that the Lahorians never deserved the cruel insults that they were subjected to A wilful ruler was determined to crush the spirit of the people just trying to throw off his chafing yoke And if I am told that all this was due to my preaching of Satyagraha, my answer is that I would preach Satyagraha all the more forcibly for that, so long as I have breath left in me, and tell the people that next time they would answer O 'Dwyerean insolence, not by opening shops by reason of threats of forcible sales but by allowing the tyrant to do his worst and let him sell their all but their unconquerable souls "

Mahatma Gandhi further wrote, "We must be prepared to contemplate with equanimity not a thousand murders of innocent men and women but many thousands before we attain a status in the world that shall not be surpassed by any nation We hope, therefore, that all concerned will *take* rather than *lose* heart and treat hanging as an ordinary affair of life "

He cautioned, "Let us not mistake reformed Councils, more law courts and even Governorships for real freedom or power They are but subtler methods of emasculation The British cannot rule us by mere force "

As the non-cooperation movement gathered momentum, Mahatma Gandhi wrote, "There is little doubt now that the boycott of the Councils will be extensive, if not complete. The students have become disturbed .. .Pandit Motilal Nehru's great renunciation of a legal practice, which was probably second to nobody's, is by itself an event calculated to change ridicule into respect."

Every palace that one sees in India is a demonstration, not of her riches, but of the insolence of power that riches give to the few, who owe them to the miserably requited labours of the millions of paupers of India
MAHATMA GANDHI

Where The Governor Shall Dwell

"An Indian governor should, in his own person and in his surroundings, be a teetotaller Without this, prohibition of the fiery liquid is well-nigh inconceivable.

He and his surroundings should represent hand-spinning as a visible token of identification with the dumb millions of India, a token of the necessity of "bread labour" and organised non-violence as against organised violence on which the society of today seems to be based.

He must dwell in a cottage accessible to all, though easily shielded from gaze, if he is to do efficient work. The British governor naturally represented British might For him and his was erected a fortified residence, a palace to be occupied by him and his numerous vassals who sustained his empire The Indian prototype may keep somewhat pretentious buildings for receiving princes and ambassadors of the world For these, being guests of the governor, they (the pretentious buildings) should constitute an education in what even "Unto This Last" —equality of all—should mean in terms. For him (the Indian governor), no expensive furniture, foreign or indigenous. Plain living and high thinking must be his motto, not to adorn his entrance but to be exemplified in daily life."

—MAHATMA GANDHI

For a Way of Life of Higher Services

A complete revolution is the greatest need of the time. The word 'revolution' displeases you. What I plead for, however, is not a bloody revolution, but a revolution of the standard of life in the higher services of the country You now belong to the governing class Let it not be said that your heels are no softer than your predecessors' or your associates' A new spirit has been born in the country. The fear of the judge within is more terrible than that of the one without.

—MAHATMA GANDHI

"PRISONER, tell me, who was it that bound you ?"

"It was my master", said the prisoner. "I thought I could outdo everybody in the world in wealth and power, and I amassed in my own treasure-house the money due to my king When sleep overcame me, I lay upon the bed that was for my Lord, and on waking up I found I was a prisoner in my own treasure-house "

"Prisoner, tell me, who was it that wrought this unbreakable chain?"

"It was I," said the prisoner, "who forged this chain very carefully I thought my invincible power would hold the world captive leaving me in a freedom undisturbed Thus night and day I worked at the chain with huge fires and cruel hard strokes. When at last the work was done and the links were complete and unbreakable, I found that it held me in its grip."

"OBSTINATE are the trammels, but my heart aches when I try to break them.

"Freedom is all I want, but to hope for it I feel ashamed.

"I am certain that priceless wealth is in Thee, and that Thou art my best friend, but I have not the heart to sweep away the tinsel that fills my room."

Austerity : Let Not The Lesser Reason Prevail

THE IRONY of the Indian situation is that even Gandhi is remembered in the vast ceremony to which the Constitution and its practice has reduced Indian democracy. And so, it seems, the President cannot escape either Rashtrapati Bhawan or the ceremonial drive

The agony of enforced pomp was reflected in Shri Sanjiva Reddy's Independence Day eve broadcast. It was remarkable for the absence of form. He spoke truly and so without seeking to impress. If he has to go through the routine of nominal power, he would rather do so with an indifference to the attendant ceremony. He wished to break out of the liveried environment in which a cruel convention has sought to confine him; but he was reckoning without the inanities of Delhi's intelligentsia.

A president without power cannot but soon become a symbol of republican ritual, unless he brings to his tasks a graciousness that is not imparted by outward forms but springs from a natural indifference to ritual, symbol and authority. Humility's virtue is in its approximation to self-effacement.

The President of India is not the court of last resort. The institution can be redeemed from irrelevance if it represents the stirrings of emerging India with an attunement to the elemental struggles of the Indian people. The sham of outraged dignity should be beyond the President's make-up and his counsel should have the authentic stamp of a man who lives nobly and in utter simplicity.

It was only natural that the President's announcement of a simple act of renunciation of a palace built as the symbol of imperial power should have brought forth that kind of response which a degenerate political, administrative and middle class milieu of metropolitan India is capable of. There was the knowledgeable outpouring of the press about the illusion of economy in a shift to a humbler residence. There was the agonised concern for some 3,000 men and women who may suddenly find themselves robbed of their unique mission of upholding presidential dignity. There was the lament about the possible decay of a noble pile with its pleasances and messuages. A thought was spared for the honoured guests used to a splendoured reception. And finally, the administration thought up a characteristically splendid new habitation for the President, which would have turned respect to ridicule.

Delhi's middle-class, used to an existence of increasing consumerism, could not have been expected to recognise how much the poverty-stricken masses sorely needed a gesture, different from gimmicks. Rashtrapati Bhavan did not merely imply pomp, ostentation and extravagant expenditure unsuited to a country of poor people; it was not mere economy of spending that has impelled the movement of austerity. It was much more. There was something strangely incongruous between the palaces of Delhi's rulers and the drudgery of life in the countryside. And Rashtrapati Bhavan together with ministerial luxury provided the rationale for a general culture of cynical ostentation that has

rked the styles of administration which have now ended to a whole gamut of public life in the pital and the country.

Nearly sixty years ago, in the month of April, 1919, s land, bounded by the Himalayas and the seas, ioed to a resounding cry of protest. What was it that red the people to that unique demonstration of olve and moved thousands of them to defy the bullets a senseless general in that garden of sacrifice in glorious iritsar? Was it the vision of palaces where there were s? Or was it the dauntless human spirit which ight to tear asunder the shackles wrought by other n?

Three decades later, freedom, a dream and vision a noble people, came in the shadow of tragedy. But, that hour of freedom was struck a deeper wound m which recovery seems as yet uncertain. A tryst h destiny? Was it? India was bidding farewell to era. A strange mercenary world was upon us. Free-n was to be encompassed in form

Members of Parliament, the Cabinet, the bureaucrats , technocrats, the businessmen and the industrialists, professors, the lawyers and the journalists—who ong them rule India? Or is there a social club that s reign in our land? Where do the people fit in this eme of things?

Buildings have come up all around us. Are not the ple desolate and forlorn?

How are our rulers going to tell the worker that must tighten his belt because there are vast masses are destitute still? The only way to stop the mad e of urban demand is for the rulers themselves to set example of austere living and bring about a radical nge in the styles of government which will convulse nation in a paroxysm of elemental purpose.

This was the meaning of austerity. It was not that exchequer might or might not have gained a few usands or lakhs of rupees in the President moving to umbler house. But the gesture could have started a cess of ending the great *darbar* that is ministerial administrative Delhi It would have brought to the of governance a touch of healing, a spirit of humility a mood of compassion. It would have been an of faith by the dumb millions of India. It would given the organised working class a sense of participation in sacrifice and involved them in a noble enterprise of partisanship with their semi-starved, half-naked brethren

Of course, there was the problem of what was to be done with the presidential, ministerial and administrative palaces. There would, indeed, have arisen the problem of the few hundred people moving about in the high-domed building or in the Mughal gardens in their liveried splendour. Any decision brings in its wake some attendant problem. "Each favourite good begets peculiar pain". But is it suggested that the problems are so overwhelming that a basic policy of great national consequence had to be abandoned?

The visiting dignitaries could continue to stay in the imperial environment, if the government so wished. But it is possible that many of them may themselves opt for a simpler environment. Their respect for this country has little to do with the profligate lavishness of its hospitality.

And whose bright idea was it that the President should move a few furlongs across to an equally ludicrous abode for the representative of republican India? Was it an effort to reduce a noble decision to a farce and a caricature?

There are enough places in Delhi where the President, ministers and administrators can live in reasonable comfort, not in luxury —the line that divides is thin but important—and in functional aloofness. Even a flat is a good enough residence from where to discharge even the most prestigious and onerous functions of the state. And it would do all the good in the world if this practice of converting a home into an office and a *darbar*—which has been the practice of the last three decades—is ended

"The world is full of small men who wish to bring down your soaring spirit". So goes a French saying, Delhi is full of them, who, with Satan, can make "the lesser reason appear the better".

It is to be hoped that the President will brush aside this crowd of urban nobodies, impervious to any sense of ethics or humility and abide by his instinct which will find an echo in the hearts of the millions of his countrymen. He should quietly move into a humble abode of his choosing and dare the world around him to do its worst.

or A New Left Movement

BANDONING the *avant garde* role, he has preferred often to remain a critic, camp follower, commentator or coffee house sage without being prepared ay a pace-setter role in politics. Like the cleric in lida he is bewitched by the sound of this rebellion, uttered, with all attendent gesture, in the sanctuary ivilege-bound rotundas or, for a change, to a captive wd" in Mavlankar Hall. He is often content to move thily about in the secret corridors of power manition, his many wonders to perform in the hackneyed me of finding shades of "progressivism" and etypal "primitivism", fascism and "democracy" ple's brand or the national variety). That he repea- finds the hues not so nat ive and authentic but geling and spurious does not daunt his steps. erday's symbol of villainy, by some wizardry, mes today's rallying point of virtue. "Like minded" forces—whatever they may mean, if they mean anything at all—are to be found here, there and everywhere. This constant "realignment" of forces, the churning of the stagnant pool of New Delhi's politics leaves our roving innocent muddied, but he carries on as though he remains as pure as driven snow.

When will this burlesque end? When will the "leftists" learn? Can they not stop being "hangers-on", bleating their ludicrous jargons? Can they not return to the path of steadfast endeavour and to those pioneering days when the idea did not get lost in the dreary sand of dead habit? Writing of the great Gopalan soon after his passing, an anguished "Kapurusa" said in *Economic and Political Weekly* that it was good that AKG died when he did. "A different code of morality is spreading its roots.... people do not take kindly to one who does not know the current set of rules; such a person jams

the signals. . A.K. Gopalan, the silly old goat, did not learn the artifice of the market place···Morality is in a melting pot. One is not at all sure that, once the churning is over, it is Gopalan, who would be considered by posterity as having been right "

AKG, as this writer said, had already "begun to belong to an irrelevant category", because, like many great and noble men before him, he could not see a contradiction between social and personal morality. He spent his last days in a setting of leftist equivocation, easy acquiescence with a lot of hypocrisy and cant and craven cowardice which passed for socialist realism Establishment paraded as the revolution; and the leftists—the whole spectrum of them—chose to be part of this "pseudo" revolutionary establishment of one kind or the other.

GOPALAN'S RESPONSES as a socialist were inseparable from his responses as a deeply human person, valuing some standards of public and private behaviour. Contrast his instinctive revolt against the incipient fascism of the emergency with the cowardly rationalisation of others who saw in it the flaming banner of anti-fascist crusade And contrast also the simplicity and charm and humility of his personal life with the pomp and arrogance and assertiveness that mark the lives of other socialists of different hues, the Lohia brand not excluded

The tragedy of the last two decades is epitomised by the fact that in a country of appalling poverty and a seething mass of injustice and tyranny, the left has not been able to establish its credibility as the symbol of emancipation of the poor, the downtrodden and the under privileged and of revolt against injustice and tyranny Is it not time that the left did some introspection ?

If the leftists, in all seriousness, went about this process of looking within they would find that, barring exceptions, they had ranged themselves on the side of the ruling elite whenever the masses were struggling to free themselves from the thraldom under which they had continued to be bound, despite all the planning and development and modernisation and industrialisation and distributive gimmicks that have gone on merrily without touching the vast millions who neither have food nor know how to fight for it. Having lost at Amritsar not only the capacity for critical creativity but also the elan of revolutionary politics, the left, already heavily splintered, was content with the debate on who in the ruling party was socialist enough

This buffoonery does not seem to have stopped yet. In the new context, socialists of all hues wish to proclaim their "modernism" and "progressivism" forgetting that beyond all this jargon lies a whole mass of frightened, tyrannised people without a lustre in their eyes or hope of early relief from their oppressive existence.

WHERE DID the left go wrong? Some time after Telengana, and together with the acceptance of the theory of "many roads to socialism" (which, in effect, led to the abandonment of the only road to socialism), the communists" or at least a good section of them, not only accepted Jawaharlal Nehru as the lodestar of socialist reconstruction but regarded as their foremost task the defence of Nehru and some of his colleagues in the Cabinet and the Congress Party. This, in itself, was no great treachery to the socialist cause. With the general weakness of the left movement caused ironically by the postures of the man whom this movement chose to defend, the "left" might plausibly have wished not to be decimated by the ascendancy of an American and business backed caucus within the ruling party. W Nehru at the helm, there was breathing time for "leftists" who could use this respite for building a bro based socialist movement.

Not only was this broadbasing not done but theory itself led to more serious compromises with fundamentals of socialist action. One kind of s deception led to another, and degeneration was b into this self-deception. Nehru was coming to terms w the reality of the internal politics of his party and external aggressiveness of American foreign pol Since the "left" refused to build its independent stren it continued its abject dependence on Nehru and cc not project itself as the champion of the oppre millions whose lot was daily becoming more and m unbearable. When other forces—good, bad or i fferent—appeared on the scene challenging Nehru his policies, it was natural that, in a setting of increa poverty, drudgery and disenchantment, the comr people chose to join in the challenge The commun a good section of them, unable to escape from the rel less logic of parasitic politics, had to deepen their com tment to Nehru and oppose the challenge to his poli In the process, they lost their credibility as the tribune the people and lost ground rapidly

The tragedy did not end here Parliamentary pol brought in further compromises and accelerated the appearance of ethical fervour, which was a redeen feature of the left movement in its early days Soci belief could coexist with individual comfort and e affluence, and defence of this comfort greatly restri the choices of action It is important to remember t this process took place in an environment of moderr tion of urban consumption which was a feature Nehru's economic policy. A whole generation "left" intelligentsia grew under the auspices of eth indifference and modernised consumption Their ssures on the government in general and on the part particular determined the deterioration as much Nehru's policy as of communist politics

THE TRAGEDY was to go deeper. Identi tion with Nehru, to an extent, arose from a class "left" acceptance of industrialisation and the pu sector as the road to emancipation of the "dumb millic of India To begin with, this was pardonable. many in this country were prepared to go with Gan Nehru's differences with the Mahatma were fundame as could be seen in the correspondence between the on the eve of British departure The differences v not only on industrialisation but on "modernis Nehru believed in both. India and her villages v primitive in the economic and technological sens not in cultural terms Her salvation lay as mucl industrialisation as in modernism. The commun like many other well-meaning urban liberals, v along with Nehru. The support to an economic pc of large-scale industrialisation and rapid expansior the public sector was based on an orthodox rationa

There were people, chief among them Gandhi him who differed fundamentally with Nehru. Dr. Lohia Jaya Prakash were leaning more towards Gandh time went by. But the Nehru approach was basec his appreciation—matched by communist appreciatic of how this country could quickly get rid of relianc foreign and indigenous monopoly capital, rapidly impi its defensive strength and produce goods and services such speed that the grinding poverty of the pe could be ended within a set period of time. The

phasis in the second and third plans under Nehru and in the fourth plan after him was on "growth". It was assumed that "growth" would bring about employment and distributive justice. There was no need for a separate orientation to employment except in some marginal terms. What was necessary, however, was to exercise strict control over and regulation of industrial growth, both through licensing policies and through the state capturing the "commanding heights of the economy".

THIS WAS an honest approach, backed by a large section of informed opinion, though there were always some equally sincere voices against. It is idle to pretend that Nehru's policies had not succeeded even as it is idle to pretend that they had not brought in their wake many stupendous problems—political, social, economic and cultural. There is now an infrastructure of industry, transportation, energy for which this country will be grateful to Nehru, when present controversies are forgotten. Our technology is diversified and we have built a body of talented people with research aids in a wide range of scientific and technological study. It would be absurd either to deny Nehru the credit for much of this or to suggest a complete break with this policy or a dismantling of this infrastructure built with painstaking effort and great spending of resources

This is not to suggest that an honest view could not be had of the validity or otherwise of the path chosen by Nehru in contradistinction with the path fervently suggested by Gandhi But in doing so, one has to recognise the positive aspects of Nehru's policies Not only that. An academic controversy over the merits of Nehru's policy hardly helps; this is an exercise which is best left to historians. If it is impossible to reverse history, it is sterile to work oneself into a rage over past mistakes, supposed or real.

Where, however, the communists failed was that, as a party claiming to be revolutionary, they were not prepared to reconsider their basic assumptions when they were leading to disastrous results.

It was not a question of choosing between Gandhi and Nehru It was a question of creative reappraisal of policy in the light of experience Apart from the monopolistic tendencies fostered by the totality of the planning process, the tremendous hold of foreign economic and political interests on our polity arising precisely from the race towards "modernism" should have caused some rethinking. Vast masses of people were left untouched by development. The public sector was fast becoming a bureaucratic paradise and licensing led as much to the fantastic growth of a few industrial houses as to a great involvement of the civil bureaucracy and the political elite in private deals. A new breed of liaison officers with lavish expense accounts exerted a tremendous pressure on policy. The nexus between an aggrandising bureaucracy and a decaying political set-up led to galloping corruption and extravagance, ostentation and to proliferation of administration. The styles of government changed rapidly with the result that New Delhi's pomp bore little relation to the massive poverty and drudgery of the people.

NOR DID the Communists sufficiently realise the significance of industrial expansion in a circumstance of great potential for a whole range of modernisation of consumption. Industrial and capitalist development in the west took place at a time when items of conspicuous consumption were relatively unknown. The capitalists, while extracting the maximum from labour, were forced to "save like bees", as Keynes said. There was wealth creation, with the consequent scope for greater employment, aided, of course, by colonial expansion.

In India, on the other hand, modernisation of consumption kept pace with modernisation of production. The industrial working class and the urban middle class, were caught in this "consumer society" and cornered a larger share of the fruits of production than the generality of the people for whom many of these fruits were irrelevant because they did not have even food or clothing or shelter or employment to begin with.

A look at the national income and consumption statistics is revealing. If one were to settle for averages, one would find that every Indian family of five people today can have, on an equal division of the national product at current prices, some Rs 450 a month, which is not such a bad thing even at the high level of prices. But the truth is that a minority of people are having a disproportionate share of the national product and much of what is produced is of no consequence to the task of ending poverty A good section of the people live much below the minmum consumption standards, which is euphemistically called poverty line—meaning that these people are semi-starved, half-naked and destitute, materially and spiritually.

At this stage, creative socialist reappraisal of the assumptions of policy was sorely needed and was woefully absent The communists asked for nationalisation of banking and foodgrains trade, pleaded for radical land reforms and worked for greater distributive justice—all of which would have been unexceptionable if they were matched by an understanding of the limits of their usefulness in an economy based on exploitation by the few of the vast majority Within the existing system, these steps could have, as they had, only resulted in a sprawling bureaucracy and a further acceleration of administrative and political corruption, without any attendant benefit to the people. Some amount of land reforms has indeed, taken place but the rural economy is not looking up as much as one would have expected

BEING DIALECTICIANS, the communists were expected to analyse the situation but they were afraid of losing their cherished notions Clinging to pet ideas, they found comfort in the "pseudo" revolution of trade union and "intelliegentsia" parasitism. They were not prepared to consider whether the evil was in the "growth" process itself, or in the assumptions behind planning

This was necessary not only from the point of view of a valid economic and social policy for India but from the point of view of democratising Indian politics. The vice grip over the political process of the demand-oriented, grievance ridden, urban class starting with business and industry, running through the consumption bound intelligentsia and ending with a working class having no partisanship with the starving millions made the generality of the people incidental, irrelevant and irksome to governance, statecraft and democracy. Not having a voice in the affairs of the country, they were content to be sullen and resentful without knowing how to act. The vote did not bring them any relief because after they had voted, the operators took over every time. Since 'efficiency" and "expertise" were sufficient ground for the denial of democracy, the client people were always outsmarted by the city stick.

The greatest indictment of the economic policy, hitherto pursued, is that it robbed the people of their sovereignty and made them vassals in a bloodsucking

process as cruel as colonial rule. It is this that troubled Gandhi greatly. His attitude to political and economic policy was determined by his dynamic, passionate and single-minded commitment to and concern for the sovereignty of the "dumb millions". For him, "the supreme consideration was man" Though he rejected organisation and, therefore, the methodological language of western political philosophy, and though he stated his conclusions in terse, aphoristic terms, he had thought and written so continuously and profusely that a clear, coherent philosophy emerges, which is neither atavistic nor simplistic. The communists have a duty to understand his compelling logic. Recognising the need and circumstance, Gandhi did not reject industry altogether. Recognising its potential for exploitation and oligarchy, he argued for its limitation. While he did not set the limits, he stated his conclusions admirably thus : "I am not against capital but against capitalism; I am not against industry but against industrialism". Simplified industry, for him, was not a mere ethical principle. It was an essential ingredient of the primacy of the people's idea. "The city people", he said, "are brokers and commission agents for the big houses of Europe, America and Japan. The cities have cooperated with the latter in the bleeding process which has gone on for the past two hundred years. We in the cities become partners in the bloodsucking process."

GANDHI'S ECONOMIC policy is only an extension of the left opposition to foreign collaboration in fields where we can go without it. The moment we go in for sophisticated technology where indigenous technology can and does deliver the goods as, for instance, in fertilisers, we throw open our policy to foreign manipulation. Thus, the limits are important Similarly when we go in for large scale industry, where small scale and cottage industries can do the job, we throw the people to the wolf. It is not merely employment and ending poverty. These goals are important and there are many who think that they are achievable at a faster rate through decentralisation of the economic process. But, more basically, if the people are to be brought into the scope of things and are to be masters of their destiny without being clients of an urban class, (benevolent. if possible, or greedy, if inevitable) one has to find objective solutions to the basic problem of people's democracy. It is here that Gandhi compels attention and the communists just cannot brush him aside as impractical, romantic, revivalist or primitive.

Industry may or may not be important; but it is a new form of idolatry to worship it as a kind of god without reference to the fact that, (to use Gandhi's words), the only god which the vast masses of this country have known is a "god of terror, vengeance, a pitiless tyrant". Partisanship with the people would require a creative socialist to break out of the comfortable prison house of jargonised concepts and seek solutions that would work in the short run as well as the long run. To think that the short term can be sacrificed for the long term is as deceptive as to think that perspectives are expendable.

It is not an accident that a whole lot of vocal people, the leftists not excluded, are up in arms against even the half-hearted attempt to reverse the priorities of planning from the urban to the rural areas. People wish to testify to their progressivism by affirming that the 1956 resolution is valid today as it was when it was adopted and by lamenting, as the Congress has done, that any slowing of the tempo of industrialisation is a throw-back to atavism.

WHEN THERE is such a ferment of ideas abroad about the validity and scope of industry as an instrument of emancipation, the Indian left continues to cling to its pet ideas. There is a safe feeling in this hugging to established concepts. Anything new makes the left feel nervous. The total atrophy of the thinking process is an outstanding feature of left behaviour in India.

Thus, in the ruling party of the time, those who stand for industrialism, growth, public sector, gigantism and monoliths are "progressive" and "modern"; those who raise their feeble voice in favour of decentralised economy, employment and people's sector are "primitive" and "atavistic". Not that a useful discussion is not possible on the limits of one or the other—big industry or decentralised economy. But to start with a premise that industrialisation is synonymous with people's interest is to foreclose the debate. And the left in this country has seldom shown any ability for creative discussion.

The reason is not far to seek. Even before the Industrial Disputes Act, the left decided that its area of operation would be predominantly urban. Its clientele was the industrial working class and its partner was the professional intelligentsia. And after the Industrial Disputes Act, which, in its many manifestations, now embraces the "interests" of the intelligentsia, the transformation of the left as the tribune of the economism of the industrial working class and organised middle class was further accelerated. Its agitations were over dearness allowance, bonus and ever-increasing emoluments. There was a vested interest in these struggles, a vested interest in urban consumerism, unmindful of the fact that every increase in the emoluments of this class further depressed the quality of life of the millions outside the organised sector. Who cared if the burdens of a price increase fell as heavily upon the unorganised poor as they fell upon the relatively better-off organised classes.

Here was a congruence of interests of big business, industry, the professional classes and the trade unions. They formed a single exploiting group against the rural poor and the urban unemployed. And if anyone had an illusion that the working and middle classes would act as the vanguard of the broad mass of people. the history of the last two decades should have dispelled it.

INDIA DOES not appear to be on the brink of a proletarian revolution leading to a working class state which will, in the interregnum, be the trustee of the generality of the people. What appears more likely is the consolidation of the unity of the bloodsuckers —the aggrandising bureaucracy having an interest in the bureaucratic sector passing for the socialist sector, the professional intelligentsia steeped in its narrow self-interest, the working class wanting its pound of flesh and businessmen and industrialists who are ready to come to terms with this ever growing economism and consumerism.

This need not have been, if only the left had given an ideological basis for the trade union and middle class movements, a basis away from sheer economism. Socialism as an economic process ignored the human process of creating a socialist man. The Indian worker today can hardly be called "socialist" in any sense of the term.

Dr. Lohia's disestablishmentarianism, arising largely from Gandhi's "anti-state," led him to launch a sustained attack on all aspects of the violence from which any state and more so Nehru's state would never be weaned away. This violence manifested itself in the cost of

Nehru's economics, the pomp and hypocrisy of the party which he headed, the corruption and insensitivity of the bureaucracy, the consumption-based upper class socialism and the ceremony of the parliamentary process. Starting from this premise, Dr. Lohia thought that Nehru and the Congress were the symbols of this high cost establishment. Just as Gandhi wanted to "destroy industrialism at all costs", Dr. Lohia wanted to remove the incubus of the Congress". While Dr. Lohia has left a whole lot of writing on his basic social, economic, political and cultural philosophy, his time was spent in attacking the basis of Congress power even as the Communists spent their time in buttressing that power. This necessarily led Dr. Lohia to alignments and compromises which have continued since and which have diverted attention from Dr. Lohia's more fundamental concerns. It was as unfortunate that the Lohia socialists could not build a strong national base of movement of the down-trodden as it was that the communists did not develop their inherent strength through mass politics as different from "class politics".

The Gandhian socialists, barring the sarvodaya workers, were always a highly glutinous lot. Even the sarvodaya workers did not attempt a coherent presentation of Gandhian economic and political philosophy.

THE BROAD spectrum of the Indian left has to move out of its narrow grooves if it wishes to play its role in this country which is crying for a left movement attuned to its ethos and needs. Apotheosis of Gandhi, Nehru, Lohia or Jaya Prakash is not the same thing as understanding the relative appositeness of their ideas. The left has to broadbase its concerns, break out of the narrow urban confines, liberate itself from the prison of established concepts, identify with the "dumb" millions without being preoccupied with the "vocal" urban pressure groups and match their actions with the unleashing of a new tidal wave of an idea movement.

—R.K.

Not Enough, Shri Advani

—Kaushik

SHRI Jagjivan Ram is reported to have said at Jodhpur that the change of government in New Delhi has not brought about any change in the styles of government and without this, we had no business to talk of a revolution, silent or raucous.

Others have felt as much. The people of this country again seem to have been cheated. On the first occasion, India's political development was reduced by Jawaharlal Nehru to a mere administrative exercise. With the passing of time, democracy became a vast ceremony. The administrative system was sanctified by authority, status symbols, ostentation, non-accountability and extra-functional hierarchies. Administration, in our times, is a pivotal factor of society and a change in the system will have a profound social consequence.

The new government does not seem to believe in this. It has maintained intact the oppressive, time-consuming, condescending, cynical, aggrandising bureaucracy even in areas where creativity should have informed the structure of administration.

Shri L.K. Advani has been very much in the news since the new government took over. He earned kudos—and legitimately, too—for quickly dismantling the apparatus of cultural tyranny sedulously built by his not too illustrious predecessor. He has been as good as his word in setting up a group to recommend the conversion of AIR and TV into autonomous bodies.

So far, so good. He has also suggested that the states should have some voice in the planning of broadcasting programmes. The maladroit handling by the Ministry of Information and Broadcasting of a projected May Day broadcast from Calcutta by a West Bengal Minister some years ago brought into sharp focus the basic issue of AIR being the instrument only of Central Government policy. More recently, during the Emergency in particular, the misuse of broadcasting extended to denigration, sometimes bordering on malice and vulgarity, of leaders of the constituent states of the Union. Autonomous or otherwise, broadcasting and television cannot have a highly centralised policy structure, if it were to reflect the differing cultural, political and social movements in the country. Competitiveness can be built into these media, without any addition to expenditure, if some of the regional stations, to begin with at least, are liberated from the centralised bureaucracy of the new set up.

Shedding control should be not only in form but in substance. Fear of a frankenstein emerging from handing over these powerful media to regional boards will be ludicrous. The Indian Constitution has not been afraid of handing over the administration of a state, including law and order, to the governments of these states; and no greater harm is likely to arise from the handing over of these media to autonomous boards responsible to state legislatures. A unitary broadcasting system is no more valid than a unitary government. If the affairs of this great nation cannot be run from New Delhi alone, the media need even less be.

To assume that a central leadership will be more responsible than the state bosses is not only to fly in the face of recent history but to adopt a posture of superior virtue, which will soon degenerate into arrogance and paternalism.

Judging from Shri Advani's utterances, one feels that he himself may not be averse to a great devolution of policy and programming responsibilities, together with matching powers, to duly constituted state autonomous boards. But he will have to overcome the vested interests of the broadcasting administration. For long, worthwhile policy has been made difficult by the career interests of the functionaries, as though administration exists for them and not for a public purpose.

Shri Advani's success will depend on his ability to overcome this resistance. He gave everyone hope of a new dimension to communication policy when he mused over the possible irrelevance of a Ministry of Information and Broadcasting. Communication is a grossly exaggerated subject and there is scope not only for dismantling the Ministry but for doing away with much of the communication infrastructure which is totally irrelevant to the needs of democracy or development. Much fat can be shed without any harm to public good and with great benefit to the health of this country, its people and its democracy.

The service-bound general and specialised bureaucracies are bound to come up with all manner of arguments against a new and radical approach. That they seem to be succeeding is evident from the continuance of the bureaucracy, in structure and in personnel, which is making the Ministry less of an idea spring-board than it ought to be.

New Priorities in Agriculture

Surjit Singh Barnala

DEVELOPMENT of agriculture has to be viewed in the wider context of a fuller and richer rural life. The fruits of development do not automatically percolate down the rural masses. A conscious and deliberate attempt will have to be made to give the rural folk a place under the sun. It has to be a nation-wide effort. Besides, employment for all who can work is one of the national time-bound aims. The quality of employment is as important if not more important than, the mere fact of employment.

The key to the attainment of these objectives is increased productivity by the cultivators who have to produce more than their own needs To induce them to produce more, conditions should be created to make them feel that they are adequately rewarded for their extra efforts. They need to be provided the necessary extra resources and a change in their outlook has to be brought about so that they can invest in land reclamation, fertilizers, good-quality seeds, pesticides and other recommended farm practices

This becomes the starting point for an ever-widening circle of all-round development covering ancillary and agro- industries; service industries: small-scale industries, handloom and handicrafts. These, in turn, would lead to stopping the exodus of unemployed or under-employed to urban centres which otherwise adds to growth of slums and focii of socio-political turmoil

The total foodgrains production in 1975-76 was 120.83 million tonnes, as against 99.83 million tonnes in 1974-75. The production this year is estimated to be around 111 million tonnes. The target at the end of the fifth plan is 125 million tonnes. The progress in this field has been satisfactory and we have a comfortable buffer of foodgrains which can ensure easy availability thereof in the foreseeable future. However, we must not be complacent nor slacken our efforts towards raising productivity.

Our experience during the last 30 years of agricultural growth has shown :—

(a) Indian farmers are ever willing to adopt economically viable new technology provided the technological package is supported by appropriate packages of services and public policies.

(b) there has been differential rates of progress between regions, between crops and between different farming systems; also, there has not been the desired degree of integration in crop-livestock-fish production systems.

(c) unirrigated areas have, by and large, been neglected since the earlier strategies relied heavily on producing the food we need in irrigated areas.

(d) rural women as a class have generally been bypassed by most extension programmes though they play a key role both in the production and post-harvest phases of agriculture.

(e) though we have developed some capacity to grow more food, we are yet to develop for the entire population the capacity to purchase and eat food; even a five per cent increase or drop in production tends to create all the difference between an uncomfortable glut and acute scarcity.

As agricultural production hinges mainly on the availability of water and timely and adequate supply of other essential inputs like improved seeds and organic and inorganic fertilisers, steps have been taken with vigour in that direction. As regards water for irrigation, experience has shown, as in Punjab, that apart from major and medium irrigation, minor irrigation is an important source of water supply. India has vast underground water resources particularly in the eastern states and parts of Rajasthan. A massive programme of ground water development has to be undertaken. In view of the constraints of water supply in some areas, emphasis is being laid on scientific water management practices. Efforts are being made to ensure that irrigation programmes facilitate multiple cropping and adoption of high-yielding varieties over larger areas.

To stabilise production of agriculture in rain-fed areas or those areas having inedquate or erratic rains, research into improved dry farming technology is being intensified. Extension machinery is being energised and made more effective to ensure that the new technology reaches the farmers. Subject matter specialists are being associated with the extension machinery for proper propagation and adoption of this technology.

Dry Farming

For augmenting production of coarse grains like jowar, bajra and maize which are, by and large, grown under rainfed conditions and partly under semi-arid conditions, the main strategy is to increase the coverage of high-yielding varieties. It is proposed to cover an area of seven million hectares under high yielding varieties of jowar, bajra and maize during 1977-78 as compared to the likely coverage of 5.50 million hectares in 1976-77. As inadequacy and variation of rainfall often leads to failure of coarse grain crops, priority is being given to evolve suitable varieties and improved farm practices including soil and crop management under rainfed conditions through the implementation of centrally sponsored scheme of pilot projects on dry farming. These projects are established in close proximity of the research centres for dry farming.

Agricultural programmes have to be attuned to current needs. In particular, we have to step up the production of pulses, oilseeds and cotton as speedily as possible. Pulses have been neglected in the past and today we find that the per capita availability of pulses has been steadily going down. They are still regarded as crops for marginal lands with sub-marginal management. This outlook has to be changed. The ICAR and the Department of Agriculture are currently developing a strategy for improved pulse production in rainfed areas, inadequately irrigated areas and irrigated areas. We would strive to increase the production of gram, lentil and peas during the coming rabi season. The measures being taken include plant protection on a massive scale, application of phosphatic fertilisers, bringing additional areas under other crops by taking up the cultivation of moong and urad

as catch crops and summer crop between rice and wheat and in the rice fallows. In addition, the centrally-sponsored scheme for the intensive cultivation of pulses has also been taken up in 46 important pulses growing districts.

Oilseeds and Cotton

The demand for vegetable oils and oilseeds has been rising faster than their production. Certain measures which can yield quick results in augmenting the production of oilseeds have been taken. These include (i) large-scale plant protection operations for the control of pests and diseases of groundnut and rapeseed and mustard, including a special and subsidised scheme for aerial spraying; (ii) launching a special campaign to encourage the use of phosphatic fertilisers on groundnut; (iii) covering large areas under irrigated summer crops in the states of Andhra Pradesh, Karnataka, Tamil Nadu and Orissa; and (iv) strengthening the seed production programme. In addition, the package programme approach under the centrally sponsored intensive oilseeds development programme is being continued for intensive production of groundnut and mustard and popularisation of improved varieties of castor seed. Cultivation of non-traditional oilseeds like sunflower and soyabeen on a large-scale is being encouraged under the centrally-sponsored scheme for the development of non-traditional oilseeds. The implementation of these and other programmes in the States is expected to stablise and increase the production of oilseeds in the country.

Considering the urgent need for stepping up cotton production, we have initiated a number of new programmes. These include : (i) aerial spraying, substantially subsidised, over larger areas for the control of insects/pests of cotton; (ii) extending the existing intensive cotton development programme to cover an additional area of 1.4 lakh hectares in seven important cotton-growing districts; (iii) providing properly fumigated quality seeds to the farmers to ensure optimum plant population for higher productivity; and (iv) strengthening certified seed production, particularly in the States of Punjab, Haryana, Rajasthan, Madhya Pradesh and Andhra Pradesh. Steps have also been taken to extend the cultivation of cotton under the command areas of major irrigation projects

For increasing sugarcane production a centrally sponsored scheme for sugarcane development is being implemented from 1975-76. The scheme envisages intensive cane development programme in compact blocks of 2,000 hectares each around the selected sugar factories. The main items of work under this scheme include healthy seed production and distribution, demonstration of improved practices, adoption of timely plant protection measures, training of cane development workers and construction of link roads around sugar factories. Apart from the developmental efforts, remunerative prices are being given to farmers, through the implementation of the scheme of dual pricing of sugar.

For increasing the production of jute and mesta in the selected districts, an intensive jute mesta district programme has been taken up in important jute and mesta growing districts in the States of West Bengal, Bihar, Assam, Orissa, Uttar Pradesh and Andhra Pradesh. Further a scheme to increase productivity has been sanctioned for foliar application and top dressing of urea.

In regard to the important plantation crop of coconut, which is a source of edible oil supply, development efforts are mainly in the direction of promoting the package programme approach, including the supply of hybrid planting material and control of pests and diseases For increasing, the production and productivity of coconuts in Kerala which accounts for about 60 per cent of the total coconut production in the country, a centrally sponsored scheme has been taken up for rejuvenation of the disease affected plantations. In addition, a World Bank project for rehabilitation and expansion of coconut plantations has also been sanctioned for Kerala during 1977. The project, *inter alia,* provides for systematic inter-cropping of coconut with high value crops.

Pesticides

The government has adopted an integrated approach towards pest management through which all the methods of control like manual, mechanical, biological and chemical methods would be used. The most important aspect in pest control is the timely detection of pest build up For this purpose, besides the establishment of about 12 pest surveillance and forecasting stations, seven more are being established and the state governments have also set up a number of pest surveillance units. Five biological control stations have been established by the central government for breeding of parasites and predators for inundative release for tackling certain pests.

The demand for pesticides is met predominantly through indigenous production. A strong foundation for the manufacture of pesticides has been laid in the country and currently the production is of the order of 47,000 tonnes. In terms of quantity, this accounts for more than 90 per cent of our annual consumption.

Prices and Production

Apart from organising efforts to supply inputs and assist the farmers in achieving higher crop production, the government attaches great importance to ensuring a fair and remunerative price to them for their produce. With this end in view, prices of agricultural produce are reviewed every year and suitable adjustments made, keeping in view the cost of production and the need to give incentive for increased production. The government also organises procurement operations for important foodgrains crop to ensure that prices do not fall below the guranteed level. Government's decision to allow some relaxations in the specification of the procurement of rain-affected wheat came as a great relief to the farmers, who would have otherwise suffered heavily on that account.

While the benefits of development are meant for all sections of the people, it has been the experience in the past that most of these benefits are appropriated by the richer sections or bigger landholders. To ensure that these benefits in agricultural sector flow substantially to the small and marginal farmers, special steps have now been taken.

Our strategy for assisting marginal farmers and landless labour relies heavily on the promotion of subsidiary activities like animal husbandry and dairying as an integral part of a mixed farming system. Obviously, landless labourer or a marginal farmer, who has practically no risk-taking capacity has to be insulated against losses due to epidemics and other calamities.

Our government is committed to eradication of unemployment within a decade. To accomplish this big task, we must develop labour intensive and appropriate technologies for each area. Science and technology must find an answer to such problems. Efforts in this direction are being intensified. □

Our ultimate aim is the deployment of a cluster of educated youth consisting of agricultural, veterinary, engineering and home science graduates for a group of 25-30 villages. It is important to adopt the cluster approach since this will also help to create a community of technical men and women who will be able to reinforce each other's knowledge.

The country cannot continue to have the old agricultural practices hereafter, as doing so would keep it where our agriculture is today and we will find it very difficult to push up production except by a few million tonnes in good seasons. What India needs today is a re-orientation with a view to using the infrastructure for growth already created for the following purposes :—

(a) improved production through increased productivity of both terrestrial and aquatic farming systems and the development of crop-livestock-fish integrated production systems;
(b) making agricultural growth an important instrument of generating more income and employment by linking production and post-harvest technologies in the form of an integrated chain;
(c) organisation of agro-industrial complexes in every district for the purpose of linking agriculture and rural industries; in such agro-industrial complexes, the landless labourer should get the highest priority to become agents of production since it has been estimated that a majority of over 100 million severely malnourished people in our country belong to the households of landless labourers; it is essential that some of the landless labourers are withdrawn from the routine operations of farmings and
(d) introducing a farmer-cum-area centered planning and intensification of location-specific research and extension.

We are now on the threshold of a new era. We are reorienting our agricultural programmes in these directions. New and newer varieties of seeds for various foodgrains and commercial crops are being developed. Credit institutions are being strengthened. Fertiliser production is being diversified and further stepped up. Government policies and programmes are being oriented to serve the major purposes of increased production and productivity; and individual and collective consumption capacity. ☐

PEOPLES PLAN II

Need to Locate Area Resources and Needs

—Dr. Radha Raman Singh

EMPHASIS on national priorities often ignores local needs. Centralised investments keep public consumption needs outside the scope of the plan, urbanisation isolated the bulk of population from the national economy. There is no functional integration. This is the cause of existence of backward regions, weaker sections, unemployment and poverty.

The people's plan II prepared by the Indian Renaissance Institute aims at fulfilling minimum primary consumption requirements of the growing population, generating employment in villages, ensuring productive participation of the masses in the development process and providing social and economic justice through proper distribution of growth throughout the economy—all of which would ultimately result in ending poverty.

While the fifth plan allocated 11.82 per cent of the total investment for agriculture and 8.76 per cent for irrigation and flood control, the people's plan allocation is of 15.28 per cent and 13.26 per cent respectively. Similarly, in the people's plan, allocation for education is 7.44 per cent and for social and community development services 23 08 per cent as against 3.27 and 12.13 per cent respectively in the fifth plan. In the industrial sector also, the people's plan puts greater emphasis on small industries especially agro-based cottage and household industries, without ignoring the significance of large industries at the national level as against priority emphasis of the fifth plan on the large industries. If the identified task in the people's plan II are really performed, it would bring about a correlation of growth and poverty elimination.

Useful Approach

The Renaissance Institute plan adopts a useful approach by estimating the perspectives of growth and employment for a 20 year long term, planning for people's prosperity with different dimensions for 10 years medium term, and a traditional plan for a three year short term.

The need in India is to start the planning process from the villages assuming the district as the basic planning unit and the entire plan projection of the country should be based on assessed needs and available domestic resources in different areas. Action programmes should adopt rural growth centre concept as a focal point for spreading plan activities over a cluster of villages in the area. Within the ambit of district plan, these rural growth centres should be properly placed in the area plan based on scientific methods of identification. Accurate assessment of needs and resource availability should be the basic tool of action programmes.

An Important Omission

While the strategy inherent in people's plan II is ideal and rural growth-oriented, the objective of rural re-orientation must be followed by a clear cut approach to planning from below the village and district levels. An action programme based on domestic resource potentialities and needs is missing in the people's plan II. A mere financial allocation with profound objective may not pave the way of development in the absence of concrete micro level plan approach and action programmes. It is here that the ideas of people's plan II should be linked with proper plan mechanism, people's co-operation, technological innovation and domestic resource mobilisation. ☐

Only Through Cooperatives Please

V.K. Balakrishnan

SOUND DEMOCRACY cannot be built around "bureaucratic nationals" such as food corporation or state trading corporation. The giants must be split into smaller units. In a country like India with mass unemployment viability cannot imply big units at the cost of small units, which provide greater employment in scattered far flung areas and help in better distribution of economic wealth. Big units, which may be economically viable, may be unmanageable in terms of better human management The Planning Commission should keep this in mind while dealing on public sector units in the next plan.

In the cooperative sector, there are now 1.4 lakh primary agricultural credit (service) societies with a membership of 40 million They cover 95 per cent of the villages and 45 per cent of the rural population. Efforts are being made in all states to improve this membership and to strengthen the primary level societies which form the base of the cooperative movement. There is also a vast network of about 20,000 distribution outlets operated and run by the cooperative consumer stores in urban and semi-urban areas and even in rural areas. The primary societies have been federated into functional federations at the district, state and national levels. There is thus an adequate broadbased institutional framework for various economic activities, including agricultural production and rural industries.

Range of operations

There has been considerable expansion in the work of cooperatives. The aggregate short and medium term loans advanced by primary agricultural credit societies increased from Rs. 578 crore in 1970-71 to around Rs. 1000 crore in 1975-76. The total long term loans disbursed by cooperatives during the fourth plan period was over Rs. 850 crore and the target for the fifth plan is Rs. 1500 crore. In marketing, the value of agricultural produce handled by cooperatives during 1975-76 is estimated at Rs. 1559 crore. Cooperatives now account for the distribution of nearly 62 per cent of the total value of fertiliser used in the country. During the 1975-76 sugar season, 103 cooperative sugar factories were in production; they produced, up to 30 June, 1976 over 2 million tonnes of sugar, accounting for nearly 48 per cent of the total production. For reaching the essential consumer goods to the urban population, there are nearly, 19,000 cooperative retail distribution points. Practically, all urban areas in the country with a population of 50,000 and above are covered by consumer cooperatives. The value of consumer goods distributed by these cooperatives annually is of the order of Rs 550 crore. In the rural areas, marketing and service cooperatives have nearly 50,000 retail points for distribution of consumer goods and the total value of consumer goods distributed by them annually is now of the order of Rs 400 crore

The cooperative sector, which reaches to remote areas, and where government machinery and democratic management are interlinked, can serve the nation in agriculutre, consumer distribution, rural industry and transport, among other fields.

Resource Raising

In the case of raising resources for the plan, much can be done by cooperatives In Kerala, for example, a drive for collection of resources through cooperatives, yielded Rs 26 crore in two weeks or so last year, as against a target of Rs 20 crore and it was meant specifically for providing loans to weaker sections. In most states very little effort is now being made to use this sector to mobilise resources for the plan. Instead this sector is being used in many states to pump in more funds in the shape of loans to rural areas. The outstandings of such loans in many states are increasing to staggering levels These outstandings were very much on the increase during the election year.

A writer said recently, "Resources need to be mobilised from the affluent farm sector to finance developmental projects, intended to provide better inputs to the middle, small and marginal farmers and to provide the necessary funds for a massive rural works programme to generate employment in the villages. The sixth plan will not be able to fulfil the national objectives of accelerating growth with social justice, unless this decision is taken in time". The article went on to suggest that the recommendations of the Raj committee should be implemented quickly. I would add that along with the efforts to implement the recommendations, a conscious decision has to be taken that for mobilising rural resources, the cooperative sector should be used in an effective way. This is all the more so, as commercial banks cannot reach the rural areas to any appreciable extent, even during the sixth plan.

The best institutional agency to finance agriculture is the cooperatives. The multi-agency approach needs review. Instead of encouraging commercial banks to finance agriculture, it would be better to induce them to help agricultural cooperatives set up processing units and storage space.

Banks Won't Do

For financing weaker sections, the government should offer guarantees for the risks involved. Commercial banks do not have the wherewithal to finance weaker sections. This is a rehabilitation and not a business proposition. The rural banks will whither away soon. These novel ideas have been forced down the throats of many who dared not raise a voice against these policies when they were decided.

Procurement and Distribution

In the twin areas of distribution of farm supplies and procurement of surpluses from farmers, there is a network of over 4,000 marketing societies at important market centres with storage space and even processing units. Considerable public resources have gone into these societies in the shape of share capital, investment for godowns and subsidies for managerial staff. As in Japan, these societies should be used as the sole agency of the food corporation of state governments for procurement of surpluses from the farmers. The farmers are members of these societies. The middlemen can be eliminated in the process. These middlemen and the bureaucracy including the bureaucracy of the food corporation are bound to resist this but their vested interests and pressures should be ignored. Otherwise the

money sunk in marketing cooperatives since the second plan will go down the drain and the middlemen will further hoard and push up prices all along the line.

RURAL INDUSTRY

Development of village, small scale and medium industries is possible only through a cooperative approach. The large number of rural weavers and artisans have no salvation except through united efforts. But in the Ministry of Industry, the post of Commissioner for Industrial Cooperatives is vacant for the last one or two years. There is, therefore, no leadership drive in that Ministry to develop industrial cooperatives. If industrial cooperatives are to be improved there is need for a definite policy decision and support from government.

In distribution of consumer items, the 1.4 lakh primary agricultural credit (service) societies, and the outlets directly run under the consumer stores should be utilised. This move by some state governments to set up civil supplies corporatives with their own outlets or private parties will distort government policies. Consumer cooperatives should be strengthened

If the government decides that the cooperative sector can be on par with the private sector, there is no need to put in valuable resources of the government in the cooperative sector and put in government nominees on the board much against the wishes of the democratic management of the cooperative institutions The Planning Commission should spell out its policy.

Prof. Wolf Ladejinsky, in his note dated 13-2-1969 submitted to government said :

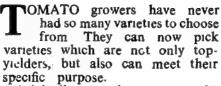
> "If the new strategy continues to lay stress on the relatively few, the inevitable social and economic tensions could at some point, overtake the process of peaceful change in the countryside, and weaken the effort to augment agricultural production The idea that under-privileged farmers "can take it" while waiting for the millennium is not as solid as the "Rock of Gibraltor

FOR A NEW SOCIETY

The Planning Commission should take a hard look at the cooperative sector in all its aspects, and use it as an instrument for social and economic change for the betterment of millions of the down-trodden in this country. Jawaharlal said in the Lok Sabha on April 12, 1959 :

(*Contd. on page* 26)

KNOW YOUR TOMATO

TOMATO growers have never had so many varieties to choose from They can now pick varieties which are not only top-yielders, but also can meet their specific purpose.


Originally, growing as a wild species in the South America, tomato has undergone spectacular development during the last 30 years.

Tomato, now tops the list of vegetables for processing Its unique quality of lending itself to various products have led scientists to develop improved varieties having different characteristics to suit different purposes—for eating fresh, making curry, processed food and canned whole tomatoes, juices, purees, soup, chutney, souces and so on. The grower has to make the right choice to suit his purpose and the particular region. It is easy to get heavy yields from them, provided a scientific method is fcllowed.

Tomato can be grown almost round the year, but the time of planting varies from region to region, because it cannot stand frost. It requires a warm weather to grow and give fruit.

In the plains of the North India, it can be sown in June-July in the nursery and transplanted during July-August. The second crop can be sown around November-December. In the hills, the crops sown in March-April can be transplanted in May-June. In the South, tomato can be sown any time during the year, but the best time is September. For the western region July and October are the ideal months for sowing.

Tomato can be grown on a variety of soils, but it does better on rich loan, sandy loam and sandy soils

The field must first be brought to the fine tilth. For heavy yields, 25-30 tonnes of well rotten from yard manure and 400 kg of superphosphate and 80 to 100 kg of potassium sulphate would be required at the initial stage.

Prepare raised nursery beds 60 to 80 cm wide and 12 to 15 cm high of any suitable length

A week before sowing treat the soil with a mixture of formaldehyde and water in the ratio of 1: 100 Soil treated with this mixture must be kept covered with alkathene for 72 hours.

Four hundred grams of seed is enough to plant one hectare. The seed should be placed one cm deep in rows marked 8 to 10 cm apart Sprinkle water after sowing, if necessary.

When seedlings are about 15 cm tall, they should be transplanted with a spacing of 60 to 75 cm between rows and 45 to 60 cm between rows and 45 to 60 cm between plants, depending upon the season and variety. Irrigate the field immediately after transplanting.

Top dress twice or thrice with 300-400 kg of amonium sulphate or C.A.N. Two or three sprays of one per cent urea at an interval of 15 days are beneficial.

Irrigate the crops every 10 to 12 days in winter and 5 to 6 days in summer. Weed regularly, hoeing will keep the field free from weeds Tomato fruit borer is a pest attacking tomatoes. Spraying of 10-12 cc Malathion in five litres of water at weekly intervals can control the pest.

Quality Seeds Production

N.S. Maini

AS THE principal agency responsible for production, stocking and distribution of foundation and certified high-quality seeds of varieties of crops in the country, the National Seeds Corporation has come a long way towards laying the basis for a sound seeds industry in India. The advantages of this specialised seed production and distribution are increasingly reaching the small farmers in the far-flung interiors of our vast country.

Established in 1963 as a Government of India undertaking, it started production and distribution of seeds three years later. An indication of its progress and expansion is available in that, while in 1966-67 it produced and distributed 7,420 quintals of foundation seeds, in 1975-76 the production of foundation seeds shot up to 54,540 quintals. The turnover in 1975 of certified seeds amounted to Rs 19.97 crore.

NSC has pioneered the seed industry. The best expertise is available with the Corporation in foundation seed production, certified seed production, processing, quality control, marketing, training and project formulation and project management.

To ensure that adequate quantities of certified seeds for raising the commercial crops are available to the farmers at reasonable rates, at the time and place where they are needed, NSC has been actively involved in certified seed production of about 210 varieties of 70 crops.

Seed, after harvest, is seldom fit for planting straight-away. NSC has established 36 seed processing plants of its own and helped in the establishment of about 100 plants of others at various places in the country for processing seeds.

Supplementing the work of established certification agencies, NSC inspected in 1974-75 79,200 hectares for quality control. NSC has a four hectare field testing station, where a certain percentage of seed lots are grown-out.

NSC set up its seed testing laboratory in 1968 independently with the indigenous know-how and equipment. Annually, the laboratory analyses between 12,000 and 20,000 samples of a wide range of crop-varieties from various seed production zones in the country. The techniques followed in the laboratory conform to international standards. NSC has recently set up a seed health testing laboratory and has begun to analyse seed samples for freedom from diseases.

Based on market studies and experience, NSC has now developed a wide net-work of about 3,500 sale points throughout the country.

NSC has so far organised 31 seed improvement training courses and eight vegetable seed improvement training courses, usually of 35-40 working days duration.

SYNCHRONISATION

The corporation has been largely instrumental in formulating the Rs 50 crore national seeds programme recently launched in India with World Bank help.

The advantages of specialisation in hybrid seed production are being increasingly shared by the small farmers in the interior of the country. Special efforts were made to increase multiplication of hybrid jowar CSH-5 for the benefit of the farmers. NSC organised seed production in Andhra Pradesh and partly in Maharashtra to overcome the handicap of synchronisation and thereby standardising the quality of seed supply to the farmers. Similarly, in the case of hydrid bajra, NSC took note of the fact that the earlier varieties of HB-3, HB-4 and HB-5 etc. had suffered from the incidence of grainier and argot diseases. A more resistant variety of hybrid bajra BI-104 was accordingly taken up for seed multiplication and NSC could supply sufficient quantities of all varieties to the bajra growing areas.

Possibilities of markets abroad for high quality seeds of hybrid crops are being explored. Domestic requirements for the hybrid seeds are, of course, taken care of.

The marketing net-work is being expanded, especially for the benefit of the small farmers living in far-flung areas. Bulk and transit storage points are being set up at different convenient locations. The selling points are organised in a mann that the farmers may not have t travel long distances to get a sma quantity of fresh seeds of improve varieties and hybrids.

These selling points and deale in the interior do not only me the needs of the farmers for hig quality seeds of cereals but also cash crops like jute and selecte vegetables which are common grown in the areas.

BREAKTHROUGH IN JUTE

NSC has achieved a major breal through in jute seed production areas which are not traditional jute growing. The maximum co sumption of jute seeds is in tl eastern sector. But the highest qua ty jute seeds of improved varieti are produced in the western sect especially Maharashtra.

The NSC is at present organisir production on seven popular varieti of jute and supplying the seed to tl eastern zone. During the curre kharif summer, that is, 1977, tl total quantity sold was 8,600 quint ls covering over 4.25 lakh acres. Ne year the coverage may be abo 7.5 lakh acres.

When NSC undertook this jo it found that while the jute growi areas are in the eastern sector, hi quality seed of jute could not produced in that area because heavy rains at the seed setting sta and that high quality jute seed cou be produced in the western sect especially in Maharashtra. The luctant farmers of Maharashtra we persuaded with sound proposals financial gain to them for undertaki jute seed production. In the beg ning, the NSC could organise j seed production hardly of a f hundred quintals. Gradually as t proposition became profitable, number of progressive farmers ca forward to take up jute seed p duction under NSC's auspices. this venture they had the dual ben of receiving specialised field train in improved cultivation practi free of cost, and side by side a go deal of profit in the proudction seed.

EMPLOYMENT POTENTIAL IN VE TABLES

The National Seeds Corporat is organising a comprehensive p gramme of seed multiplication selected varieties of vegetables co monly used at home and abro The advantages in tapping the ternational market in vegetable se

(Contd. on Page 26)

Constructive Programme

Narayan Desai

REVOLUTIONS have two dimensions. On the one hand, they seek to remove old systems, on the other they try to establish new ones. But very few revolutionaries throughout the world succeeded in striking a balance between these two aspects. Gandhiji was among these exceptional revolutionaries.

Even as he led the struggle against the British Empire, he visualised, launched and organised programmes for the making of a new society. These programmes he called the 'Constructive Work'.

"The Constructive Programme", "he said, "may otherwise and more fittingly be called construction of Poorna Swaraj, or complete independence, by truthful and nonviolent means" "Complete independence," he continued, "through truth and nonviolence means the independence of every unit, be it the humblest of the nation, without distinction of race, colour or creed.

"Imagine", Gandhiji further said, "all the crores of people busying themselves with the whole of the constructive programme which is designed to build up the nation from the very bottom upward Can anybody dispute the proposition that it must mean complete independence in every sense of the expression ?"

It was with this lofty ideal before them that over six hundred constructive workers from all over the country, engaged in a score of activities such as Khadi and village industries, basic education and the propagation of the national language, prohibition and the eradication of leprosy, the service of the Harijans and the Adivasis occupied themselves for three days in a kind of self search.

The Gandhi Smarak Nidhi has been organising these conferences since the Gandhi Centeuary year For the last two years, however, such a conference could not be organised because of the restrictions on freedom of speech clamped by the emergency. Hence, the three-day conference which ended in New Delhi recently provided the opportunity to many workers to breathe some fresh air.

One of the themes that often occupied the minds of the speakers was the role of the constructive workers during the emergency. "We were all divided in our attitude towards the emergency," one of them regretted. "It is necessary to ponder over this matter and decide that this kind of division does not recur among our ranks whenever and wherever fundamental Gandhian values, such as human rights, human dignity, rule of law and justice, or demcoratic functioning are at stake."

The second most important theme was the awareness that the recent change in government did not mean the achievement of goal, it only meant the beginning of the journey afresh. It was said, "Let us not forget the permanent kind of economic and social emergency under which more than half our countrymen are still crushed. This is the time to engage ourselves with redoubled zeal in the process of mass-awakening of these teeming millions".

It was also reminded that no democracy could be real if it were based on Vote-catching. Attempts ought to be made to create and sustain as many democratic institutions at all levels as possible so that the initiative would rest with the people.

IGNORAMAN

Breaks out
into a rhyme
O! for a bail,
No for a jail,
So do I wail
When do I sail ?

Code of Conduct

Some of the participants were aware that revolution, like charity, began at home. They, therefore, suggested a code of conduct for the workers and the institutions.

It was said that the workers should devote some time regularly in activities that would put them into direct touch with the people and that constructive work should be a constant process of self-education for the workers and they should consider no age to be unfit for acquiring new knowledge. Some time in the daily schedule should be devoted regularly for productive manual work.

The code also suggested that the institutions should develop methods of work that would result in more and more participation of all their workers in the decision making process of the institution. The organisation of the institutions should be such that the higher the level of the management, the lesser the authority in executive matters. The importance of austerity and simplicity was also emphasised.

The problem of relationship with political parties was discussed at some length. It was felt that while the constructive workers should be fully alert about political forces prevalent in the country, they may not identify themselves with any political parties.

One of the participants pointed out that the average age of the participants of the conference seemed to be above sixty—a sad commentary on the participation of young blood in constructive work. It was realised by many that the younger generation could be attracted towards constructive activities only when they are co-related with some kind of mass movement, be it the struggle for independence in the days of Gandhiji, the bhoodan-gramdan movement in the fifties and sixties, or J P's movement during the seventies.

"Real Swaraj will come, not by the acquisition of authority by all to resist authority when it is abused. In other words, Swaraj is to be attained by educating the masses to a sense of their capacity to regulate and control authority".

—Mahatma Gandhi

Correcting Distortions in the Constitution

Shanti Bhushan

WHEN the Republic of India was born on January 26, 1950, its Constitution was in many respects unique. Its preamble set out certain high ideals common to all mankind with a view to attaining them, detailed provisions were made to govern the powers and the relationships between the different organs of government and the political units of the union.

At that time, our Constitution also had the not necessarily enviable reputation of being the longest in the world. It rapidly acquired another, namely that of being the one most frequently amended in accordance with its own provisions.

During the first 25 years of its existence, the Constitution had been amended at least 35 times. While the number and frequency of amendments have often been the subject matter of criticism, it does not necessarily follow that the amendments by themselves are questionable. Towards the close of the last century, a well known professor of political science, who also had the distinction of being the President of the United States, Woodrow Wilson, pointed out that law is nothing but a crystallisation of the habit and thought of society. As society changes, law has necessarily to adapt itself to the felt necessities of the times—and the Constitution—the fundamental law is no exception to this rule.

The Constitution cannot be likened to the laws of the Medes and the Persians, immutable for all time, for if that were so it would vanish as did the empire which adopted this rule.

While there is room for an honest difference of opinion as to the value and need for some of the amendments made earlier, they could not be regarded as being contrary to its basic structure or as being contrary to the noble objectives enshrined in its preamble.

The position, however, became different after the proclamation of emergency and the dark period of our history which followed. Constitutional amendments were resorted to not for the purpose of attaining the objectives which the founding fathers of the Constitution and the father of the nation before them had striven to achieve, but to serve temporary political and even perhaps personal ends.

Glaring Instances

It would take me too long to catalogue all of them and it would be sufficient to mention a few of the more glaring distortions effected in our constitutional structure as a result of these amendments Some of these were directly relatable to the proclamation of the emergency and the judgment of the Allahabad High Court unseating the former Prime Minister.

One of the reactions of the government to the decision of the Supreme Court, granting a limited stay of the operation of the Allahabad High Court judgement, was to amend the Representation of the People Act so as to alter with retrospective effect the law relating to the legal issues which were decided or might have conceivably been decided against the then Prime Minister—being equivalent to altering the rules applicable to a game after it had been played.

Such legislation, was itself open to challenge on the ground that it infringed the provisions of the Constitution and consequently resort was had to Constitutional amendments.

Consequently, the Constitution (Thirty-ninth Amendment) Act was enacted by which the Representation of the People Act, 1951, and certain other laws relating to elections including the Election Laws (Amendment) Act, 1975 were inserted in the ninth schedule of the Constitution to render them immune from attack on the ground that they were violative of the Constitution.

The ninth schedule rapidly became an ever-expanding container in which every enactment in respect of which there was even a remote possibility of its being challenged on the ground that it was repugnant to fundamental rights, was cast irrespective of the nature of the enactment and whether the enactment needed or deserved protection.

So rapid was the expansion of the ninth schedule containing the list of enactments which were deemed to be valid, notwithstanding anything contained in the Constiutution relating to fundamental rights, that the schedule which contained 86 Acts before the passing of the Constitution(Thirty-ninth Amendment)Act, came to contain 188 Acts by the time the Constitution (Fortieth Amendment) Act was passed. It is significant that this schedule which was originally intended to include only measures relating to land reform, became a "catch all" in which all enactments which the Government wanted to enact, notwithstanding the fundamental rights, were included. Of these, mention might be made of the Maintenance of Internal Security Act and the Prevention of Publication of Objectionable Matter Act, 1976. The last of these is now no longer with us having been repealed in accordance with the pledge given in the manifesto of Janata party to restore the freedom of the Press.

Some More Equal Than Others

Another significant distortion of the Constitution is to be found in Article 329A which was inserted specially to get over the difficulties caused by the High Court judgment in the election case of the former Prime Minister. Departing from the principle of equality of all citizens before the law, this Article created a special class of persons who were more equal than others. This provided for the constitution of a special authority to decide questions relating to the validity of the election of any person appointed as Prime Minister or elected as Speaker.

Any order of a court or other authority declaring the election of a person holding either of these offices to be void was sought to be nullified and a specific direction was given to the Supreme Court to dispose of pending appeals and cross-appeals in accordance with the amendment effected, thus eroding the independence of the judiciary

The Constitution, as originally enacted, provided that disputes connected with election of the President or the Vice-President, the highest offices in the land, should be disposed of by the Supreme Court, the highest judicial organ.

This wholesome rule was done away with by a new Article 71 which

sought to replace the Supreme Court by an authority constituted under a law of Parliament, thus giving to an amorphous authority greater weight and position in determining a purely judicial dispute than that accorded to the Supreme Court.

Pending the amendment of the Constitution, which can be done only with a special majority in both Houses of Parliament and which majority is unfortunately not available to government in the Rajya Sabha, an effort has been made to correct this unhappy trend by providing in the law that the authority in question shall, in the case of the elections of the Speaker and the Prime Minister, be a Judge of the Supreme Court nominated by the Chief Justice of India, thus restoring to the judiciary its rightful function of deciding disputed elections. Similarly, the Presidential and the Vice-Presidential Elections Act has been amended declaring the Supreme Court as being the authority to try election petitions involving the President and the Vice-President.

RIGHT TO LIFE AND LIBERTY TAKEN AWAY

Reference may also be made to an important amendment made in Article 359 by the Constitution (Thirty-eighth Amendment) Act which was brought into force on August 1, 1975 during the period of the emergency. Before this amendment only the enforcement of fundamental rights could be suspended by a notification issued under Article 359 during the period of the emergency. The effect of this amendment, however, was that not only the enforcement of fundamental rights but the fundamental rights themselves stood suspended as a result of such notification. It was on the basis of this constitutional amendment that it became possible to raise an argument that the right to life or liberty itself was not in existence during the period of the emergency and, therefore, it was possible for any officer of the government during the period of the emergency not only to arrest and detain a person without any ground whatsoever even if such detention could not be justified under the provisions of MISA but that a government officer could put any person to death for any reason whatsoever and no challenge could be raised to such action because there was no right to life itself in existence till the period of the emergency was over.

We then come to the highly controversial Forty-second (Amendment) Act. While a few of the changes effected by it may, like the proverbial curate's egg be good in parts, yet it is basically repugnant to the fundamental concepts of democracy and the rule of law. It would be too long to mention all the unfortunate changes which have been made as a result of this amendment. It would be sufficient to mention a few. Apart from increasing the duration of Parliament and of the state legislatures with a view to prolonging the hold on power of the persons then in office, it curtailed the jurisdiction of the courts.

The power of the High Courts to pronounce upon the validity of central laws, which term, it would be interesting to notice, includes not only laws passed by Parliament but subordinate legislation made by any authority, has been taken away. The result is to drag persons from the four corners of India to Delhi to obtain redressal of their grievances. A special majority for the invalidation of central laws has also been prescribed.

The effectiveness of an independent audit was also curtailed by taking away from the Comptroller and Auditor General the power to prescribe the form in which the accounts of the Union shall be kept and conferring this power on the President, i e. the executive government

STATE AUTONOMY DILUTED

Similarly, the autonomy of the states to enact legislation to check anti-national activities was taken away and conferred on Parliament. Further, the powers thus conferred on Parliament by the new article 31D are so sweeping as to exclude judicial review of the validity of any such law. The article is also so wide in its scope that even legitimate criticism of Government or trade union activities could be brought within the description of anti-national activities.

Finally, Article 368 of the Constitution was amended so as to preclude challenge to the validity of any constitutional amendment even on the ground that the procedure prescribed by that very article, such as the requirement of a special majority or the requirement of ratification by the state assemblies, had not been followed.

The above is only a brief enumeration of the several distortions which have been brought into our constitutional structure during the period after the declaration of the recent but unlamented emergency. In fact, the list would be prolonged indefinitely.

It is obvious that steps should taken to correct these distortions a to restore the Constitution on t path shown by the father of t nation and our constitution make Such correction is one of the declar objectives contained in the ma festo of the Janata Party.

But such correction would not an easy task. Apart from the tec nical and the legal difficulties, has to be kept in mind that t Constitution can be amended on if a special majority for that purpo is available to support the measur in both the Houses of Parl ment.

The present government does n have the necessary majority in t Rajya Sabha. The necesary suppo for enacting any such measur would be forthcoming only if the is a vigorous public opinion in favo of correcting the distortions whi have been deliberately introduc Once the popular feeling manife itself, then it is possible that t necessary majority would be for coming.

It is primarily for the peo themselves to be alert in this directi and give the necessary impetus a direction to their representatives Parliament, for the primary respo ibility for their happiness and we being rests with themselves. It h been said and rightly that if t secret of happiness is freedo the secret of freedom is eternal vi lance and stout hearts □

NUCLEAR POWER

"It is unspeakable. It is th ultimate transgression and think they are just crackpot who do it. It's a Mafia. It i not intelligent and not respo nsible behaviour to put into th world these beastly substance and then say, "Oh leave it t us. We will see that nothin leaks out"... and anyway, i doesn't solve any problems There is no sizable nuclea programme (that is economical unless you go to the breede reactor, and that is anothe dimension of violence."

E.F. Schumacher

C.D. In the New Context

Haripad R. Subramonia Iyer

THE major problem of modern government is maintaining and developing all aspects of social and economic life of the entire people as well as optimum ecological development; hence the need for integrated socio-economic planning and of matching styles of administration at different levels. The gap between economic and social indicators calls for integrated approach so that economic growth with social justice is possible within the framework of democratic order. In short, economic and social development should go hand in hand.

The concept of integrated rural development is at once old and new. It is old in the sense that Mahatma Gandhi advocated it. He said that village life must be touched at all points. To Gandhiji, every village must be self-sufficient to meet its most basic needs and should consist of people bound together in bonds of mutual cooperation and interdependence His conception of a village was that it should have its own sanitation facilities, water works ensuring clear and adequate water supply, house of worship for all, a common place for meeting and grazing, cooperative dairy, khadi and village industries for providing supplementary occupation for the peasants, primary and secondary schools, compulsory services of village guards, and village panchayats for settling village disputes. In short, he advocated integrated total development of the entire rural people and full and balanced development of the entire rural areas and development of village panchayats as autonomous democratic village republics within a sovereign democratic republic.

Means of Ending Privileges

The concept is new in that the community development programme with community and area approaches and extension education and community organisation as its methods is a comparatively novel developmental strategy applicable to all countries of the world. In other words, community development is a unified approach to the multi-dimensional problems of rural areas-problems of poverty, illiteracy, ill-health, idleness, ignorance and subsequent weak motivation, squalor, chronic food shortages, social and economic oppression and exploitation, lack of housing facilities, over-population, superstition, traditionalism, conservatism, regional socio-economic imbalances, low level of living, urban explosion, lack of capital, low agricultural productivity, poor means of transport and communication and traditional feudal attitudes.

The privileged who operate effecitvely as a pressure group are able to maintain the status-quo of allocation of resources and the deprived majority who cannot operate as a pressure group continued to be discriminated against in resource allocation The socially, economically and educationally underprivileged sections of the society have to be brought into the national mainstream of life if the minimum of social and economic justice and political freedom is to be achieved. The importance of community development is not just that it can effectively answer some of the needs of the rural people, but it can provide an effective means of eliminating privilege.

It is concerned with the basic problem of creating a sense of cohesion or unity amongst the entire people at a time when highly disruptive forces are at work in society.

Integrated Administration

The need for optimum administrative efficiency is another factor responsible for integrated rural development. The need is for coordination and co-operation in administrative activities. Hence there is need for certain administrative arrangements which aim at the transformation of the existing general administrative structure into welfare cadres rather than at the establishment of a separate and distinct welfare administration.

The community development programme must be conceived in a manner which recognises the indivisibility of the development and welfare of the individuals. An administrative arrangement which attempts to coordinate and integrate all the development efforts in a given geographical area under one roof is required.

In all societies there exists in the mass of the population a great reservoir of energy awaiting use. India is rich in human resources not merely in terms of number, but also in terms of its quality, capacity and potential. The calibre, integrated approach has its major purpose of mobilising and utilising some of the energies for constructive purposes.

An integrated planning approach includes the conception of a system of not only goal and means but also the agents of integrated development which are reciprocally dependent. The nature of national development depends upon the extent to which governmental and non-governmental agencies can participate in the process of integrated socio-economic planning, development and administration. There is need to provide mechanism to ensure that the relevant development agents concerned participate and are involved in the formulation of policies and programmes of integrated rural development. The formulation and implementation of integrated socio-economic development programmes depend upon not only an effective administrative system but also on the functional capability of the development agents who are both governmental and non-governmental agents including self-help or voluntary organisations. Rural development plans and programmes should be based on the felt needs, and urges of the people. The relative roles of the union, state and local bodies in integrated rural development should be clearly specified and well-defined. There is difference between the concept and role of local bodies in developed societies and in developing societies. Panchayati raj bodies should reorient themselves so as to take a major share in the integrated development of entire rural communities. ☐

Democracy is a kingless regime infested by many kings who are sometimes more exclusive, tyrannical, and destructive than one, if he be a tyrant.

—Benito Mussolini
(Fascism)

On the whole, with scandalous exceptions, democracy has given the ordinary worker more dignity than he ever had.

—Sinclair Lewis

Instrumentation : Big Strides

—SuhbashJ . Rele

INSTRUMENTATION LTD., a public sector enterprise in Kota, Rajasthan, has moved a long way in a decade of its existence. During 1976-77, the Company achieved an all-time high turnover of Rs 15 crore almost trebling it in three years and thus establishing an average 40 per cent growth rate in the last three years. Profits have gone up from Rs 47.88 lakh in 1975-76 to Rs 115 lakh in 1976-77. With orders worth Rs 66 crore on hand and several under negotiation, the company expects a high rate of growth.

The Palghat plant of the company, which manufactures control valves and allied items, is now in its second year of operation and has reached a production level of Rs 162.68 lakh. The unit has now reached the break-even stage. The project report had visualised this to happen by the fourth or fifth year.

The company has been supplying instrumentation and control equipment both on retail and on systems basis for the export market Exports during 1976-77 amounted to Rs 85 lakh against a target of Rs 70 lakh. The erection and commissioning work at Tuanka Ja'afar Thermal Power Station in Malaysia is almost complete.

Orders From Abroad

Very recently the company secured an export order worth 10 7 million Malaysian dollars from the National Electricity Board of Malaysia for a turn-key instrumentation and control system for a thermal station of Prai near Penang in Malaysia. The order was secured against keen competion.

The company has begun the production of gas analysers and accessories. Telephone exchange sets worth Rs 28.5 lakh were manufactured. Trial production for selector switches, synchronising control of tilting burners, site thermometres, and solenoid valve resistance temperature detector B-1 has been completed and they are expected to go on stream this year.

In 1976-77 instrumentation schemes were provided for eight thermal power stations in the country. Instrumentation and control systems for fifteen more thermal power stations are in advanced stage of completion. The company has already indigenised about 98 per cent parts of existing Russian range of instruments supplied to various projects covering a business of about Rs 600 crore.

R&D efforts have resulted in the development of several sophisticated instruments like versions of miniature potentiometric indicators, resistance temperature detector type B1 and modified type B1 for nuclear power stations. Work for conductivity meters for all line measurement and control is over and these items have been undertaken for production.

The turnover of the company is expected to increase by about Rs 100 crore in the next three years.

CALCUTTA U-RAIL

A Feat of Engineering

R.K Bansal

THE COUNTRY'S first underground railway system, the Calcutta U-rail, is round the corner 1980 is expected to mark the beginning of actual trials on the 2.5 kms of the nearly 16 5 kms. long Rapid Transit System, mostly under ground, from Dum Dum to Belgachia, being constructed by the Metropolitan Transport Project (Railways)

The project estimated to cost Rs 250 crore is divided into 17 sections and work on eight of these, covering over five kms. is in hand

When completed, the Calcutta RTS will have 17 stations averaging a distance of less than one km. The proposed high speed trains would run at a frequency of less than two mts during peak hours. On an average nearly 300 trains each way per day running between Dum Dum and Tolleygunge will ultimately carry 16 to 20 lakh passengers daily.

Some of the important features of the Rapid Transit Systems are : all trains will have a uniform class of accommodation, the journey would be mostly through an underground RCC box tunnel, all trains will have automatic overspeed protection with cab signalling system, and fire warning and fire fighting arrangements, adequate communication system will be available within the train and with the world outside, the trains will run on ballastless track laid on concrete, the tunnels would be fully ventilated with the provision of cooled air, and there will be no interference with surface transport or air pollution hazard.

The RTS trains would run on electric traction with 75 volts DC current drawn from the third rail and will have a maximum speed of 80 kms/h. The running time between Dum Dum and Tollygunge including 15 halts would be a mere 34 mts.

Alongside the construction of the box-tunnel, the design as well as indigenous development of equipment required for power supply, air-washery, ventilation system and signalling and telecommunication is also progressing according to schedule. The system would required about 40 megawatts of power supply which has been ensured. Action has also been initiated to develop an indigenous prototype RTS coach to be manufactured by the Integral Coach Factory, Madras. The traction equipment is likely to be supplied by a public sector undertaking in the country.

With unhampered flow of inputs, it is hoped that the construction work on the Calcutta U-rail will be completed by 1984-85.

Indian Railways Today

EVERY DAY the Indian Railways carry eight million passengers and haul over six million tonnes of freight in 11,000 trains run over 60,231 route km. with 7,056 stations across the country.

The trains run over a total of 1.3 million km. on an average a day—about three and a half times the distance to the moon. They carry more than half the total passenger traffic in the country and two-thirds of the freight traffic.

Owned and working under the single management of the Central Government, the Indian Railways are Asia's largest and world's fourth largest rail system. They are the country's largest public sector undertaking with total assets of Rs 53,450 million and annual revenue of Rs 17,670 million, and the largest employers with a staff strength of 1.7 million.

The Railway Board, a high-powered body of specialists in different fields working under the overall supervision of the Minister, controls and directs the operations. The network is, however, divided into nine railway zones, for convenience of administration, and each zone is a large system in itself.

With a modest start in 1853, when the first train ran between Bori Bunder and Thana in Western India, a distance of 35 km., the system has grown into its present mammoth size over the years. At the time of Independence, Indian Railways were mostly dependent on imports. Today this vast system is sustained and developed essentially on its own strength.

Self-reliant Growth

The Railways have developed an integrated organisation for research, design and standardisation as a substantial base to advance the indigenous manufacture of all railway equipment. Today we are self-suffisient in design and manufacture of almost all types of railway equipment including some of the more sophisticated types. The import content in the railway purchases has been brought down to eight per cent against almost total dependence on imports before 1947.

The Chittaranjan Locomotive Works (CLW) was set up near Calcutta in West Bengal in 1950 for manufacturing steam locomotives. When the traffic demands started outstripping the limitations of steam traction, the CLW turned to production of electric locomotives and is now producing even dual-current AC/DC locomotives—the most sophisticated in the world.

Production of diesel locomotives was taken up in the country in 1964 at the Diesel Locomotive Works, at Varanasi in U.P. Over a thousand locomotives have already been manufactured there.

Earlier, the Integral Coach Factory had been established in Perambur in the South in 1955 to manufacture and furnish passenger coaches. Over 10,000 coaches of more than 60 types, including air-conditioned sleeper and chair car, electric multiple unit coaches, AC 2-tier coaches, and double-decker coaches have been produced by this factory so far.

Besides these three major production units, the Railways have a number of workshops. Some of these took up production of wagons in 1960. This, coupled with production in other public sector units, has made the country self-sufficient in meeting internal demands.

The railway system has developed in a manner that it transports bulk commodities over long distances leaving short-distance traffic to roadways. The share of bulk commodities like foodgrains and fertilisers, petroleum products, steel, ores, cement, and coal, in the overall volume of revenue-earning rail traffic is over 80 per cent. Such freight traffic of commodities which are essential to the growth of the economy and well-being of the people sometimes yields revenue less than the cost. But as a public utility service, Indian Railways carry and discharge this obligation. Correspondingly some of the high-rated traffic goes over to road.

Another interesting feature of our Railways is that 74 per cent of the freight traffic is carried on trunk routes connecting metropolitan cities of Delhi, Madras, Calcutta and Bombay.

To help faster movement of goods, super express goods trains operate to fixed timings on trunk and other important routes. Again, a Quick Transit Service (QTS) is available between principal commercial centres with delivery of goods guaranteed within a fixed period for a nominal surcharge. The container service provided door-to-door damage-free fast transport and the freight forwarder service consolidates and carries small consignments in wagon loads at relatively lower rates.

Passenger Amenities

Over the years much attention and outlay has been given to improving passenger amenities and comfort, speed and frequency of the trains. Single-class fast-running trains were introduced some years back to relieve overcrowding on trunk routes. More recently long-distance superfast and inter-city trains have also been introduced, to further reduce overcrowding on the trains. New lines are being laid to open up backward and neglected areas; and it has been decided that all new long-distance trains to be introduced in future will be classless.

Under the planned development of the railway system, the massive increase in the demand for goods and passenger traffic has been met largely by increasing the capacity of the already existing routes through gauge conversions, doubling of track, traction modernisation and improvement of signalling and communication systems. Workshop facilities have been expanded in step with the increasing repairs and maintenance requirements.

Export Potential

The technical advancement and expertise gained by the Indian Railways over the years is now being exported for developing the railway systems in some Asian and African countries. India-made railway equipment is in use on the railways in many countries including Burma, Sri Lanka, Thailand, Korea, Nigeria, Saudi Arabia, East Africa Iran, Iraq, New Zealand, Hungary, Poland, Turkey, Canada, France and the Philippines.

Two public sector organisations—the Rail India Technical and Economic Services (RITES) and the Indian Railway Construction Company Ltd. (IRCON)—have been set up. RITES have undertaken consultancy contracts in Syria, Iran, Zaire, Iraq, Ghana, Nigeria and Tanzania.

The last three months have witnessed a remarkable improvement in the performance of the railways in all directions. For example the passenger traffic has gone up by about 10 per cent when the Budget had anticipated only six per cent increase. Goods traffic has kept pace with the Budget projections. Ordinary working expenses hav

gone down. With the result the net financial position is a gain of over Rs 33 crore in three months.

Similarly, the production in the major production units in CLW, DLW and ICF has outpaced the output in the corresponding three months of 1976 by 36 per cent in terms of money.

Much of this has been possible by a new and enlightened industrial relations policy. Workers, participation in management is being encouraged and extended and welfare schemes for workers are getting greater attention.

QUALITY SEEDS

(*Contd. from Page*..15)

are numerous. There is a big scope for exchanging valuable technical knowhow on quality vegetable seed production. Secondly India can create a dent in the international market for vegetable seeds by supplying high quality seeds of internationally renowned varieties at highly competitive prices and thereby earn valuable foreign exchange. Thirdly, production of high quality vegetable and flower seeds is highly labour intensive, and provides scope for large scale employment for farm labour in the production of sophisticated varieties of seeds.

Already in acordance with some arrangements agreed to with a leading company of Europe, the NSC is developing its knowhow in the production of seeds of varieties commonly grown in Europe by multiplying the seed materials of the varieties popular there. Side by side, it is also affording valuable opportunity to the Indian farmers and scientists to compare the potential of vegetable varieties grown in Europe with those of India with regard to their crop yields, acceptance in the market and in the kitchen. This has opened new vistas of joint research in agriculture and has established India's superiority in being able to supply top quality seeds to any part of the world and also suitable for any agro-climatic condition. It has been established that Indian varieties like Punjab chhuahara tomato, Indian varieties of melons and onions find widespread acceptance in markets abroad. Besides, these efforts are also helping in organising production of high quality seeds of selected flower varieties. □

Plea For Ceiling on Non-Agricultural Incomes

Ayodhya Singh

LAND REFORM in the traditonal sense means changes in land tenure, specially the redistribution of land ownership and the reform of this kind may be by division of large estates into small holdings or by transfer of ownership of the land from a large property holder to a tenant cultivator of a small holding

Thus, the essential difference between the old and the new approaches is that while the former concentrates on changes in land tenure, reform has now come to mean something approximating to land improvement. It is as much an agricultural policy as it is a social policy.

The first plan recognised that the pattern of land ownership and cultivation is a fundamental issue in national development and set out a broad outline of policy.

The second plan sought to remove impediments in the way of agricultural production arising from the character of the agrarian structure and create conditions for evolving as speedily as possible an agrarian economy with high levels of efficiency and productivity. A second policy goal was an egalitarian society to be achieved by abolition of intermediary tenures; tennacy reforms including regulation of rents, security of tenure and enabling the tenants to become owners, ceiling on land holdings; consolidation of holdings; and agrarian reorganisation.

The third plan envisaged implementation of the policy.

In the fourth plan, suggestions were made for a reorientation of land policy, having regard to the technological developments in agricultural and social requirements of the time and for a review of the provisions in the existing legislation and measures for their expeditious implementation.

In the fifth plan special attention has been given to the tenancy problems. The important guidelines that took shape over the successive plans were reiterated.

Most of the necessary legislation has been passed and implemented. Most of the states have also taken steps to vest in the tenant homestead rights.

Ceiling is an important aspect of land reform which must be implemented for social justice. It may help in solving the problem of elimination of poverty, if applied with firmness. But, it is not possible to eliminate big holdings, in the true sense of the term, so long as there is no ceiling on non-agricultural incomes. Society has to be reformed as a whole. Socialism in compartments cannot be effectively implemented. □

COOPERATIVES

(*Contd. from Page*..14)

"I should like this (Cooperation) to be considered from an even broader point of view of reorganising our vast rural areas, of building a new social structure The essential characteristics of a cooperative or panchayat are close contact, social cohesion and mutual obligation. This is vital for building up gradually a new structure for our rural society This is an enormous undertaking".

The role of cooperatives and the "Cooperative Sector" has to be considered in the context of building a strong rural India.

TOMATOES

(*Contd. from Page* 14)

For controlling dumping off disease seed treatment with Agresan G.N. or drenching the soil of the nursery with Captan is recommended. Early Blight and Late Blight can be controlled by spraying Diathene Z-76 two gm mixed in one litre of water twice or thrice.

Leaf Curl is the most severe virus disease of tomatoes. It can be checked by controlling the vector (white fly). Spraying with 0.05 per cent Malathion or Falidal is effective Tomato is also attacked by root knot nematode. Growing a resistant variety like S—120 is recommended in affected areas. Chemicals like DD and Nemagen can also control the nematode.

The fruit is ready for harvest in 75 to 100 days after transplanting A good crop can yield 200 to 350 quintals per hectare. □

Vice-Grip of Urban Elite

Krishna Chandra Roy Chowdhury

IN MOST of the backward economies unemployment, like Janus, has two faces: mounting urban unemployment and surplus labour in the rural sector silted up in seasonal unemployment or underemployment. At the bottom, these two types of unemployment are the two facets of the same phenomenon. Urban unemployment is merely a spill-over of rural underemployment in traditional agriculture. In fact, it is possible to show that underdeveloped countries like India in seeking to accelerate the rate of growth of income under their impressive five-year plans have accentuated the problem of unemployment and inequality in the distribution of income.

Each society develops its own rules of the game to determine the manner in which work and property are to be combined in production, and the way the income is to be distributed among the members of the community. In primitive economies income from work and income from property were inseparable. Under feudalism land is owned by a select group of families whose titles date from past history and are established by the appropriate rules often sanctioned by law or religion. In feudal societies work is provided by peasant families who own little or no land and very few of the capital goods (ploughs and livestock); they finance their own consumption partly out of carry-over from harvest to harvest and partly out of loans from the landlord or the moneylender. The landlords make the level of rents what they think right, and if they are ruthlessly exploitative they fix them at a level which permits peasants a bare level of subsistence. They enjoy the whole technical surplus of production over the subsistence minimum, which appears as income from property. An increase of population reduces the surplus per man but it increases the total of rents, up to the point where the marginal product of labour is equal to the subsistence minimum. When income per head is reduced to subsistence level with the reduction of the size of holding, growth of population can go no further and rents are at the technically possible maximum. Under feudalism the level of rents, given technical conditions, depends upon the amount of labour When population has reached a size at which the marginal product of labour is equal to subsistence, competitive demand for land establishes the same level of rents as would obtain under the landlord's monopoly.

Limiting Factors of Migration

A subsistence economy with semi-feudal agriculture adjusts itself to the problem of growing population in two ways. First, it seeks to provide for the economically redundant members of the community by a pooling of economic activities and of the total output within a family or a more extended group. Surplus labour is looked upon as part of the nature of things, and ways are devised to provide work for each member of the family who shares in the family income not necessarily in relation to the value of his individual contribution which is roundabout zero. Everybody is kept busy on farms so as to maximise total output which after the payment of rent is shared among the members of the extended family.

In this system the economics of work and product allocation under a share-alike rule give the member a subsistence income that exceeds his marginal product which is round about zero and approaches the average net product after the deduction of rent. The value of this average net product in effect establishes the reserve price for his labour outside agriculture. Other things being equal, the surplus labour in agriculture will not be prepared to accept employment elsewhere which might deprive him of his right to share in the family income unless the wage offered is much in excess of this reserve price in the rural sector. Thus zero marginal productivity of labour in agriculture does not result in either a misallocation o labour or in an unlimited supply c labour to the nascent capitalist eco nomy in the urban sector. Th phenomenon of disguised unemp loyment in agriculture need no cause a reduction of wage rates i industry where there may be emp loyment opportunities. Rural under employment is thus compatible wit equilibrium wage rates in industr the floor to which is provided by th reserve price of labour in agriculture

Secondly, these quasi-feudal eco nomies seek to adjust themselves tc the growth of population by devel oping rules of morality under which the wealthier members of the com munity, the landlords and business men, feel obliged to fill up thei households with a retinue of ser vants, priests and artists. In a tra dition-bound society this obliga tion almost becomes a status symbol which extends even to the middl class. Strange as it may seem, even the hard-headed businessmen are embroiled in this spirit, and follow ing the social mores, burden thei enterprises with a large number o useless clerks, peons and othe hangers-on. What is given as wages is more in the nature of charity than payment for serious labour which is neither given nor expected.

As population grows it becomes more and more difficult to keep the surplus labour in this unproductive occupation. The growing numbers spill over into casual trades in the cities; markets are crowded with pedlars and stall-holders making occasional sales. A great many people are forced to offer their ser vices as shoeshines or porters o to trade at street corners in tiny lots of matches or buttons; there is a vast reservoir of mechanics, dock workers, construction workers and others who get such casual employ ment as thay can, averaging per haps a day, a week or less. Al though everybody seems to have some sort of work, however grea the pressure of population, the are in disguised unemployment eking out a miserable existence i squalor and poverty.

Breakdown of Social System

There are thus two elements i the enforced idleness of labour in quasi-feudal economy like India the landless labour in agricultur steeped in rural underemploymen and seasonal unemployment, an disguised unemployment in th urban sector. They subsist in th penumbra of the organised secto of the economy in agriculture an

---

Shri Roychowdhuri is Professor of Economics, University of Burdwan.

industry where profit maximisation rules. They constitute what is called the informal sectors of the dual economy. The primary characteristic of the informal sector is the sharing of income and under-employment.

Development planning in backward economies has led to a breakdown of this social system with its age old resilience without bringing in its place a viable economic system that can absorb the surplus labour. Dualistic models of growth, sometimes explicitly but more often implicitly, have constituted the basis on which broad development strategies have been formulated. Economic growth has been sought to be accelerated by a transfer of surplus labour from low-productivity agriculture to the high productivity manufacturing sector. The strategy of growth has been an increase of effective demand through a substantial rise in expenditure on public investment financed largely by budget deficits, leading to a sharp rise in prices. The result of the last twentyfive years of development planning has been remarkable no doubt in the face of unprecedented growth of population. What has come as a shocking surprise, however, is the growth of massive unemployment and inequality in the distribution of income.

Kuznets once advanced the hypothesis that the secular behaviour of inequality follows an inverted 'U-shaped' pattern with inequality first increasing in the early stages of development with a reversal of this tendency in the later stages. Following Kuznets, the proposition that the distribution of income worsens with development at least in the early stages has been advanced in a much stronger formulation with the possibility of less absolute impoverishment of the lower income groups. Needless to say, this state of affairs is in sharp contrast with the fundamental objectives of development planning; the diminution of poverty and human misery. It seems that development in its endeavour to achieve self-sustained growth has lost sight of its ends.

In general, we find three aspects of the development process which appear to be systematically related to the degree of inequality and growth of unemployment in a planned economy like India:

(1) Intersectoral shifts due to allocation of resources in favour of heavy industry and relative neglect of the traditional agricultural sector;
(2) Choice of technology.
(3) Absence of redistributive fiscal policy.

Prime Cause of Disparities

Intersectoral shifts under planned development may be looked upon as a possible mechanism through which the process of development affects income inequality and the level of employment. Kuznets argued that development typically involves accelerated growth of the industrial sector which slowly absorbs population from the low income, relatively stagnant agricultural sector. Such a process would lead to an increase in relative inequality in the early stages of development and under certain conditions would generate the U-shaped curve. Adelman and Morris have also emphasised this dualism in the structure of the many developing countries: the existence side by side of a technologically and institutionally backward agricultural sector, and a technologically advanced and well-organised industrial sector. The more pronounced becomes the dualism under planned development the greater the incidence of inequality. As the growth of the modern industrial sector is an essential ingredient of the growth process, economic development itself is one of the prime causes of the growth of income inequality in developing economies.

As scarce capital and other resources are pre-empted by the modern, typically privileged urban sector to the detriment of productivity and income levels in the agricultural sector, the intersectoral differences in income tend to widen. These differentials could have been narrowed if the accelerated economic growth of the modern sector had created a strong demand for the surplus labour in agriculture. But the range of policy instruments favouring capital-intensive development and the choice of technology under the five-year plans have actually discouraged the use of labour in the growing industries. Industrialisation stimulated by import substitution has created high-cost enterprises with a bias against the use of labour-intensive technology. Protection by making the exchange rate overvalued allows capital equipment to be imported cheaply because of low duties on such imports. The technology embedded in this capital equipment is designed to save labour and its import has contributed very little to the expansion of employment. Artificially low interest rates coupled with artificially high wage rates due to trade union pressure and government action have concealed the social cost of capital and encouraged the entrepreneurs to use capital-intensive technology. Investment licensing has also encouraged the tendency towards mechanisation by offering special incentives to invest; the decision to build, alter or expand the manufacturing capacity is to be submitted to a licensing committee which has neither the competence nor the wish to understand the purpose of the system and to devise a set of explicit economic criteria of choice that can counteract the bias towards capital intensive technique. The policy of import substitutions has also been an invitation to the great oligopolistic corporations to set up capital-intensive production units inside the tariff walls.

High-Wage Economy

On a more fundamental plane, the range of policy instruments that have encouraged capital-intensive development stems from a technique of planning whose professed objective is a high growth rate of the national product. This is essentially a Victorian concept of development or "progress" as it was called then. The operational concept of this development is more output preferably industrial output. To maximise industrial output, industrial technology is imported directly from the developed countries by encouraging foreign firms to set up plants within the country or indirectly when indigenous capitalists or governments, following foreign models, at first import equipment, and later reproduce some elements in it. This technology evolved in the developed economies under pressure of high wages obviously requires a high cost of investment per man employed; it is manifestly inappropriate to the situation of an underdeveloped economy with surplus labour and limited investible resources. Given the spectrum of eligible techniques, a lower degree of mechanisation requires a smaller cost of investment per man, a larger future output per unit of investment and more employment compared to a more mechanised technique. A higher degree of mechanisation is, however, more profitable because, with this technique, the saving on the wage bill is greater than the value of output foregone. Such a technique is claimed to be more advantageous to the underdeveloped eco-

nomy because it yields more surplus to expand investment in the future even if it offers less employment now. The implicit assumption is that the surplus or profits are sure to be invested and not to be consumed by the capitalists on luxury. Experience shows, however, that capitalists in underdeveloped countries are unlike their Victorian counterparts; they are yet to shuffle off the habits and traditions of feudal landlords: they prefer consumption to accumulation. They prefer readymade techniques imported from abroad and are helped by a government whose predilection for large impressive schemes is not the most efficient way of using the limited resources for the eradication of poverty and unemployment.

Absence of a redistributive fiscal policy in an underdeveloped country like India has accentuated the problem of income inequality and unemployment. The need to allocate a larger share of public expenditure for the support of heavy industries in the public sector and the necessary infrastructure in the urban area has reduced the share of development expenditure in the rural sector. Rural public works to absorb some of the surplus labour in agriculture and agricultural development projects, especially in the form of irrigation schemes, credit facilities, and mixed schemes involving land clearance, provision of improved seeds, storage facilities and extension service can go a long way in reducing poverty and increasing employment. On the other hand, a progressive tax policy can do much to reduce income inequality in developing economies But the institutions and structure of political power stand in the way of progressive taxation so that the increasing ratio of indirect taxes to total tax revenue means in effect a more than proportionate reduction in the income of the lower and middle income groups whose real income tends to decline with rising prices. It is well-known that commercial farmers and rural landlords to whom most of the benefits of the "green revolution" have accrued pay little or no taxes. Given the power structure they manage to turn the administrative measures to their advantage.

What can be done to mitigate the growing unemployment and income inequalities and their deleterious effects on social stability in the developing countries? Although the answer to this question, for a number of reasons, is not easy, it is possible to advance some general suggestions which can form the basis for specific and concrete measures. To get a process of development going in a quasi-feudal economy requires three ingredients: (1) a redistribution of land and rural public works; (2) capital-saving innovations in industry along with land-saving innovations in agriculture; and (3) a tax policy designed to ensure sufficient restraint on consumption that permits resources to be used for investment.

Small Holdings

Rural under-employment arises from an unequal distribution of land holdings among families. Smaller holdings are by and large more intensively cultivated than larger ones and, given the abundant supply of rural labour, total production is likely to increase by a redistribution of land It is technically possible to use the rural underemployed (or their seasonal idle time), as the Chinese have shown, to improve irrigation, check erosion, build roads, and so on, but the individual property in land is an impediment to such schemes. There is great scope for land saving innovations in agriculture because they raise output per acre without reducing labour per unit of output (as in the use of fertilisers), but steps must be taken to ensure that the rich farmers do not get a larger share of the miracle seeds and fertilisers and other inputs that go with them than the poor peasants With redistribution of land the peasant will have sufficient security to improve the land and the incentive to part with the marketable surplus to feed the wage labour in industry.

Although development is rightly identified with industrialisation in the general sense in which it applies as much to agriculture as to manufactures, there is need to switch the emphasis from grandiose, capital-intensive heavy industries to projects that save capital, increase productivity and absorb labour. There are many possibilities of using what have come to be known as "intermediate technologies" that involve methods and equipment more productive than primitive handicrafts but requiring much less investment per man and per unit of output than western technology. The highly mechanised imported technology is an extension of capitalist ideology to a semi-feudal economy with surplus labour where it is highly inappropriate. It requires more investment to provide employment, and starts on a scale that requires a large share of scarce capital and other resources. Planned industrialisation under the policy of protection has created high-cost enterprises with huge excess capacity; the consumer goods they produce are suitable for consumers with incomes much above the average. To create markets for these goods an unequal income distribution is needed. The inequalities in income distribution is a necessary consequence of the adoption of modern technology. Multinational corporations operating in developing countries have also contributed to this process.

Vested Interest

Government policies are largely determined by the strategy pursued. The decision-makers in government are part of the elite who benefit from the high growth policy and the adoption of western technology which tend to generate inequalities; those who benefit gain power, wealth and influence and set in motion policies that reinforce the inequalities and the pattern of development which give rise to them. These forces of wealth and power inhibit the adoption of redistributive fiscal policies that can threaten their power and privileges. Moreover, redistribution of income through progressive taxation of income without redistribution of assets (land reforms, nationalisation of industrial property) is not likely to be successful. Such a radical redistribution is a revolutionary requirement which is not palatable to democratic societies so that a policy of incremental redistribution has been proposed. This is the Chenery method of redistribution through growth. This strategy will involve switching of additional incomes from consumption of luxury goods to investment in small-scale industries for the production of consumer goods for the common man. One wonders whether the planners will be bold enough to pursue this policy in a society where politics dominates over economics. □

If by the mere force of numbers a majority should deprive a minority of any clearly written constitutional right, it might, in any moral point of view, justify revolution.

—Abraham Lincoln

Yojana Quiz

1. What is the Fata Morgana?
2. Does sound always travel at the same speed as through air?
3. What makes a lead pencil write?
4. Why cannot we walk straight when we shut our eyes?
5. What is the blue light on the sea at night?
6. Why do moths fly round a light?
7. Why are the spokes of a mangle wheel curved ?

nswers

1. It is a form of mirage known in the Mediterranean, and been named Fata Morgana or Morgan the Fairy, after half Sister of King Arthur to whom legend assigned places which are suggested by the effects of refraction u the distant landscape. It can be seen at the straits of Messi
2. No; the lighter the gas the faster the sound travels throu it if the pressure and temperature are the same.
3. A "lead" pencil is made up of tiny crystals of carbon. T form of carbon is called graphite, from the Greek word writing. The crystals are small and of such a shape that tl can easily be rubbed away from each other.
4. The reason is not in our stride, but in the difficulty in bal cing. Our eyes are of the greatest importance in helping to balance our bodies and without them the weight of c bodies is apt to go too far on one side or the other.
5. The sea is really full of living matter and of matter whi has been alive-the bodies of dead sea-creatures, some anin and some vegetable. These are slowly oxidised by the ox gen which dissolved in the sea-water, and has been got fro the air, and as they are oxidised, or burned, they give out t faint light which we see.
6. In the dim light of evening and night they can see ligl coloured flowers, and as they depend on flower nector f food they fly toward anything bright. When they fly rou a light, they are trying to get into it as if it were a flowe
7. Metal always contracts on cooling, so that both wh and spokes are liable to crack after casting; by making t spokes curved, the wheel is much less likely to come to har Spokes shaped this way give much more play when the me contracts on cooling.

Quotation Box

We are bad soldiers and bad citizens but as poisoners we have no rivals in the entire world. We succeeded in making a world event out of something as stupid and vapid as Fascism.

BOOKS

An Open Economy Hodel

Trade Protection and Economic Policy : Essays in International Economics *by Dr. Alok Roy; The Macmillan Company of India Ltd., Delhi,* 1976; *Pages XIV—73; Price Rs.* 30]

THE SEVEN essays of outstanding merit included in this slim book cover a wide range of issues in international economics like the implications of intermediate inputs, non-traded goods, domestic distortions, non-economic objectives, smuggling, government budget constraint and wealth effect. Primarily meant for professional economists the areas covered are the positive aspects of the pure theory of trade, welfare aspects and the balance of payments theory. Hence, they are not of direct relevance to the conundrum facing India of estimating effective protection rates and economic resource costs and the general problems of dovetailing policies for economic and trade development.

The author's efforts are directed towards showing how some of the standard theorems (the Heckscher-Ohlin, Stolper-Samuelson, Factor Price Equalisation and Rybczynski) can be generalised on the one hand to a two factor—three commodity framework that is non-tradable and how all commodities can be used as intermediate inputes and final products, on the other, simply by considering factor intensity rankings in terms of *total* coefficients as distinct from *direct* coefficients. The general equilibrium framework and the alternative measures to effective protection to cope with non-traded inputs carries forward the work of Jagadish Bhagwati since 1964 and seeks to underline the significance of the modifications that are necessary in the various theorems already mentioned. The author is of the view that the results could vary according to the fact that the traded intermediate commodity is assumed to be domestically produced or solely imported from abroad.

That the existence of a positive import duty (export subsidy) is superior to free trade when domestic distortion causes underporudction of the import (export) commodity may not necessarily hold in the presence of a non-traded sector is a point that is often disputed. The author has dealt with this in chapter 3 obviously for the reason that this has direct relevance to Indian economic policy and the various problems faced by the country. The next three chapters carry forward the arguments based on the theorem of optimum tax structures to achieve various non-economic objectives. Here again, the author carries forward the earlier writings of Bhagawati and Srinivasan and subjects them to rigorous mathematical analysis. The choice between the first best taxes or second best taxes (with uniform tax rates confined to a class of commodities or different rates of taxes both within and outside that class) is sought to be decided by proving the theorem which is nevertheless, vitiated by the presence of smuggling. Smuggling, as stated by the author, renders invalid the traditional superiority of import duties over production subsidies as alternative means to cut down import below the free trade level.

The author next proceeds to extend the analysis of the short-run impact of alternative government policies in an *open economy model* taking explicitly into account the wealth effects that arise out of the government budget deficit and the current account trade surplu The 'short run' implications that have hitherto remain unexplored have been taken in hand with a prelimina distinction between a number of alternative concep of monetary and fiscal policies. The author terms h conclusions based on this exercise to be an 'unorthodc possibility' in so far as it points towards the desirabili of a high degree of international capital mobility throug bond-financed government expenditure which is likel to be less expansionary than tax-financed expenditur under flexible exchange rate system. By the same toker fixed exchange rate system could create havoc.

The major contribution of these essays lies in thei using the framework of the general models and examinin the advances made thereon so far on strictly empirica lines and highlighting certain policies to usher in an ope economy. A deeper involvement with the domesti realities, however, is bound to assist the author in disc arding both the general theories and their partial modi fications effected by some of his seniors in the professior based on their insights into India's trade policies sinc late fifties. Tersely worded and highly original, these essays are at once a reflex of the hiatus that divides ou sophisticated academics from the pragmatic levels o thought in various organisations that has buttressed the entire foreign trade apparatus for decades. All the same, under Indian conditions these empirical studies offer scope for numerous simulation exercises in furtherance of policy options.

—B.N. Nair

Organisation in Industry

Organisation Theory in an Open System *by Anant R. Negandhi; Kennikat Press Corp and Dunellen Publishing Company, Inc.* 1975; *Pages* 325; *Price* £-9.

THIS book is a description and analysis of a research project initiated by the generous funding from the Ford Foundation, U.S.A. Mr. Negandhi has produced another very interesting and readable book, designed for organisation theories. The project was conducted in a number of developing and developed countries.

The book's layout is designed around Negandhi's notion that the organisational and enterprise effectiveness of an industrial firm in a given industry, with a given size and technology, are functions of management practices. Management practices are themselves functions of external environment and socio-cultural variables and of the firm's organisational concern toward its task agents or publics. In support of this notion, he presents the data on developing and developed societies.

The first chapter defines the salient characteristics of the closed and open systems and provides some illustrative examples of organisational studies. The second chapter sets out the research methodology and design—definition, conceptualisation and operationalisation of major variables, samples and methods of data collection. Chapters three through eight provide a comparative analysis of management practices in the United States parent companies, the United States subsidiaries, and the comparable local firms in the seven countries. This is one source on consultation which provides data on environmental and socio-cultural variables, allowing one to make inferences and interpretations that might or might not be the same as the author's. In chapters nine and ten, the managerial effectiveness of organisations is examined and in the last chaper eleven, the universality of management practices and principles.

According to the author the socio-cultural behaviour patterns, as well as economic conditions, are more similar than different in developed and developing countries. Negandhi has based many of his conclusions on contextual and socio-cultural and environmental variables. It would have been better if he had made a study of a wider range of variables.

Nevertheless the book has germinal value and provides the curious among organisational scholars with thought provoking readings.

—**Pradeep Kumar Saxena**

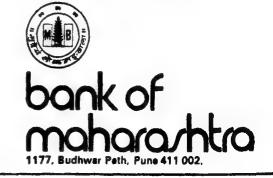
Money, Trade & Fiscal Economics

Fiscal Economics *by K.P.M Sundharam and E.N. Sundharam (Price Rs 15)*; **Money Banking Trade and Finance** *by K.P.M Sundharam (Price Rs 18)*; **Foreign Exchange : Principles and Practices** *by K.K. Andley (Price Rs 16); all published by Sultan Chand & Sons, Delhi*

PROFESSOR K.P.M Sundharam is quite popular especially with the undergraduate students of the Indian universities as well as with those preparing for the various professional examinations. His style of writing is quite simple and easy to follow. The fourth edition of the book "Fiscal Economics" besides providing theoretical knowledge on the subject also includes for the first time a comprehensive study of a number of issues in the Indian fiscal economics like economic classification of the budget; public accounts Committee; estimates committees and separation of accounts from audit; Contingency Fund and Consolidated Fund and; Sixth Finance Commission. Also included are for the first time theoretical discussion on functional finance, federal finance and local finance

In his second book "Money, Banking, Trade and Finance.,,—whose seventeenth edition has appeared this year—Professor Sundharam has added three chapters partaining to National Income Accounts; Basic Concepts of the Theory of Employment and Output; and Equilibrium Level of Income and Employment Here he deals with both Keynesian and post-Keynesian tools of analysis Simple questions have been added at the end of each chapter, providing a good basis for objective type of tests for students. The book gives a detailed study of the Monetary economics, the theory of income and employment banking and financial institutions, Indian currency and banking

In his fourth edition of the book "Foreign Exchange; Principles and Practices" Professor Andley has added fresh material of current interest and taken out matter which had become outdated. For instance, he has included the 1974 Revision of the Uniform Customs and practices for Documentary Credit; some of the new facilities provided by the E.C.G.S., the Foreign Currency (Non-Resident) Account scheme of the banks that deal with foreign exchange for the Indians residing abroad, Deferred Payment Arrangement in Foreign Trade; Long-term Forward Exchange Cover to Exporters provided by the Reserve Bank of India; Amendment of the I.M.F Articles of Agreement He has also rearranged the chapters to make the treatment of the main issues more logical, besides revising and enlarging the chapters on the Arithmetic of foreign exchange. Though the book has been particularly addressed to students preparing for the bank (C.A.I.I.B) examination it would be found useful even by those interested to have a working knowledge on the subject of foreign exchange.

—**V.S. Mahajan**


Development Notes

Three-fold Increase in Tea Estates

There was three-fold increase in the number of tea estates in the country during the period from 1961 to 1975. According to statistics published by the Tea Board of India, the total number of estates registered with the Tea Board rose to 13,264 in 1975 from 9,499 in 1961. South India accounted for the bulk of the increase, from 6,978 to 10,738. Kerala's share was the highest 4,203 in 1975 against 1,976 in 1961. During the period the area under tea increased to 363,303 hectares from 331,229 hectares, in North India the area rose from 256,928 hectares to 289,503.

Shipping Tonnage Crosses 5 Million GRT

India is the first maritime developing country in the world which has attained the shipping tonnage of over 5 million GRT According to the annual report of the Ministry of Shipping and Transport for 1976-77, the country's operative tonnage crossed the 5 million GRT mark last November comprising 335 ships of 50.36 lakh GRT. In addition, 33 vessels of 7.08 lakh GRT are under construction.

Indian shipping continues to operate on all the important international trade routes. During the year, it extended its coverage to the India-Latin America sector, provided direct shipping facilities to Mogadishu in Somalia and Mozambique and introduced a new monthly global service to the USA The share of handling bulk cargoes by the Indian flag vessels in 1976 was over 56 16 per cent as compared to about 42.93 per cent in the previous year.

Higher Production Target for Heavy Industries

A production target of a little over Rs 1000 crore has been fixed for the public sector undertakings under the control of the Department of Heavy Industry for 1977-78 This represents about 26 per cent increase over the production of Rs. 829 c ore achieved during 1976-77. The profits of these undertakings are also expected to improve correspondingly to Rs. 72 crore.

New Record in Marine Export

Marine products export reached an all-time high with 66.840 tonnes valued at Rs 189.50 crore in 1976-77 against 54.463 tonnes valued at Rs 124 crore, in 1975-76, recording a growth rate of 23 per cent quantity-wise and 52 per cent in terms of value. Frozen shrimps, canned fish and dry fish are the three major items exported by the country.

SFDA Projects Help Small Farmers

Over four and a half lakh small and marginal farmers have benefited so far from minor irrigation projects undertaken under the central sector scheme of the SFDA (Small Farmers' Development Agency) initiated during the fourth plan period. The evalution studies conducted recently by the Reserve Bank of India and other independent organisations of the scheme show that the subsidiary occupation programme like dairying and poultry had benefited over four lakh small and marginal farmers. Adoption of improved agricultural practices in the project areas has helped 34.35 lakh farmers.

Grants-in-aid of Rs 112.77 crore have been released so far by the Centre to the 160 SFDA projects The outlay in the fifth plan for the SFDA is Rs 174.50 crore.

Beas Meets Sutlej

The waters of the Beas were poured into the Sutlej at the first-ever man-made confluence of the two major rivers at Slapper in Himachal recently in a mighty bid to augment the water resources of the Govind Sagar Lake of the Bhakra complex. The waters of the two rivers will serve the teeming millions of Punjab, Haryana and Rajasthan. The project was completed in 12 years at a cost of Rs. 380 crore.

About 35,000 workers and 2,500 engineers worked day and night to complete the linking of two rivers through two tunnels of 13 km each linked by a 12 km-long open channel. The tunnels have a diametre of 28 ft each.

Impressive Rise in National Income

The national income, at constant (1960-61) prices recorded an impressive rise of 8 8 per cent in 1975-76 as against an increase of only 0.2 per cent the previous year. The rise in the national income as disclosed in a study on national income, savings and capital formation (1975-76) prepared by Reserve Bank's Department of Statistics has been mainly attributed to the large increase in foodgrains production which rose from 100 million tonnes to 121 million tonnes.

The RBI study showed that in per capita real terms (1960-61 prices), income in 1975-76 rose by 6.6 per cent; the highest growth rate ever recorded The previous high was of 5.9 per cent recorded in 1967-68. At current prices, it meant a rise of 1.6 per cent.

The rise in capital formation in public sector was, however, more substantial than in the previous year, Rs 1,682 crore, against Rs 790 crore. Net domestic capital formation at current prices rose from Rs 7,156 crore in 1973-74 to Rs 9,576 crore in 1974-75 (+33.8 per cent) and further to Rs 11,058 crore (+5.5 per cent) in 1975-76. As a proportion of net domestic product, it was 16.2 per cent in 1975-76 compared to 14 7 per cent in 1974-57 and 13.0 per cent in 1973-74.

Fertiliser Production Goes Up

About Rs 110 crore were saved in foreign exchange through increased production of nitrogenous and phosphatic fertilisers during 1976-77. Their combined production stood at 23.80 lakh tonnes against 18.55 lakh tonnes during 1975-76. This is revealed in the annual report of the Ministry of Chemicals and Fertilisers for 1976-77. The report said that nitrogen production in 1976-77 was 19 lakh tonnes as compared to 15.35 lakh tonnes during the previous year, registering a 23.7 per cent growth rate. Output of phosphates stood at 4.8 lakh tonnes against 3.20 lakh tonnes, an increase of 50 per cent.

Production of single superphosphates, which had been falling during the past few years, not only improved but registered a 73 per cent growth rate in 1976-77. Further, six single-superphosphate plants, which had suspended production in the previous year on account of high inventory and financial difficulties, resumed production. In the case of nitrogen, capacity utilisation increased from 61.9 per cent to 72.5 per cent and of phosphates from 51.6 per cent to 69.4 per cent. The report said that at the beginning of the year, 20 large size fertiliser plants having a capacity of 25.09 lakh tonnes of nitrogen were in operation.

Nine-fold Increase in Power Generation

The power supply industry has made significant progress since the planned development era began in 1951. Total installed capacity during this period has increased nine-fold from 2.4 million kw to 22 million kw. According to the report of the Energy Ministry for 1976-77 by the end of the fifth plan the total capacity was expected to reach about 30 million kw. The total length of transmission and distribution lines which was about 30,000 circuit km in 1951 stood at 1.5 million circuit km by the end of 1976-77. An addition of about 2,900 circuit km was expected during the year.

Allocation of funds in 1976-77 for the entire power sector was of the order of Rs 1453 crore-32 per cent more than 1975-76. The per capita consumption of electricity during 1976-77 would be about 115 kwh as against 109 kwh assessed for 1975-76

Crash Programme to Develop Cash Crops

A crash programme for an overall development of various commercial crops of Kerala with World Bank assistance to the tune of Rs 62 crore has been set in motion. The scheme is not at the cost of food crops but as a supplementary to it.

Under the crash programme with World Bank aid, all varieties of crop like rubber, coffee, tea, cardamom, tapoica and cashew besides coconut will get a new push in cultivation and production. Twentyfive thousand hectares, mostly nationalised forest land, would be brought under cashew plantation.

New Coal Reserves Found

Prospects of coal production in the country have further brightened with the discovery of new reserves in a number of virgin areas in Bihar and West Bengal, indicating gross sub-terranean stock of about 20,000 million tonnes. The Geological Survey of India in course of its recent explorations, located a seam having a gross reserve of 1,144 million tonnes in Hura and Chuperbhita basin in Rajmahal hills of Bihar. The Chuperbhita basin with a 874-million tonne reserve, incidentally, is the largest coal-bearing area in the Rajmahal hills.

The GSI in its restructuring of mines through systematic exploration in and around working coal fields has also spotted "beyond the known limit" a reserve of 747 million tonnes of coal in the eastern extension of the Raniganj basin in West Bengal. Elsewhere at Meja in Bankura district, south of the river Damodar, the deposits in the recently discovered coal seam are estimated at 180 million tonnes.

Nickel Ore Deposits Found in Cuttack

Orissa contributes nearly 56 per cent of the country's total mineral production in terms of value, according to the Geological Survey of India The State with an area of 155,400 square kilometres occupies a pre-eminent position in iron ore, manganese ore and chromite production besides contributing dolomite and limestone in substantial quantities. The GSI, which covered about 85,000 square kilometres in the State with geological mapping, has for the first time established the existence of a "workable" nickel ore deposits in Cuttack district pushing the State into an enviable position on the mineral map of India.

The occurrence of lead in workable concentrations, proved over a strike length of 1000 metres in Sundargarh district, and the recent discovery of economically viable base metal mineral deposits in another district, are landmarks in the history of mineral exploration in the state. The GSI and other allied institutes have located as many as 27 types of minerals in the State.

World Bank Aid for Farm Project

The World Bank has approved a Rs 23.9 crore project to boost farm production in 17 districts of Rajasthan. The project will help increase the yield of all major crops in these districts by 25 per cent in five years. Based on the phenomenal success achieved by a similar project in the Rajasthan canal and Chambal command areas, it is aimed at transferring improved technology to farmers through constant training. The scheme, introduced in the Rajasthan canal and Chambal command areas about two years ago, has helped double the paddy yield. In the case of other crops also, the increase in output per hectare has been encouraging.

The project will provide direct employment to 3,500 persons in rural areas for three years.

The Ministerial Chair and The Bleeding Process

"To think that your occupation of the Ministerial chair will be vindicated if you serve the cities only would be to forget that India really resides in her 7,00,000 village units What would it profit a man if he gained the world, but lost his soul in the bargain ?

"Our cities are not India. India lives in her seven and a half lakhs of villages, and the cities live upon the villages They do not bring their wealth from other countries The city people are brokers and commission agents for the big houses of Europe, America and Japan. The cities have co-operated with the latter in the bleeding process that has gone on for the past two hundred years It is my belief based on experience that India is daily growing poorer The circulation about her feet and legs has almost stopped And if we do not take care, she will collapse altogether .

"I regard the growth of cities as an evil thing, unfortunate for mankind and the world, unfortunate for India The British have exploited the villages. The blood of the villages is the cement with which the edifice of the cities is built I want the blood that is today inflating the arteries of the cities to run once again in the blood vessels of the villages

'We in the cities become partners in the blood-sucking process, which phrase, however bad it may be, truly depicts the state of things I have known something of this (village) class. I have brooded over their wants, and if I was a painter I could draw a picture of them with their blank eyes, without a spark or lustre or life in them. How are we to minister to them? Tolstoy gave the picturesque phrase, 'Let us get off the shoulders of our neighbours'. If everyone performs that single operation, he would have rendered all service God requires of him...

"The real question is how to bring about man's highest intellectual, economic, politcal and moral development In this, there should be an equal right and opportunity for all In other words, there should be equality between the town-dwellers and villagers in the standard of food and drink, clothing and other living conditions. In order to realise this equality today, people should be able to produce their own necessaries of life, that is, clothing, foodstuffs, dwellings and lighting and water .

"If the village perishes, India will perish, too. It will be no more India Her own mission in the world will get lost The revival of the village is possible only when it is no more exploited Industrialisation on a mass scale will necessarily lead to passive or active exploitation of the villagers as the problems of competition and marketing come in Therefore, we have to concentrate on the village being self-contained, manufacturing mainly for use . .

"The true Indian civilisation is in the Indian villages The modern city civilisation you find in Europe and America, and in a handful of our cities and which are copies of the Western cities and which were built for the foreigner, and by him But they cannot last. It is only the handicraft civilisation that will endure and stand the test of time. But it can do only if we can correlate the intellect with the hand ..

"Independence must begin at the bottom Thus, every village will be a republic or panchayat having full powers. It follows, therefore, that every village has to be self-sustained and capable of managing its affairs even to the extent of defending itself against the whole world. It will be trained and prepared to perish in the attempt to defend itself against any onslaught from without. Thus, ultimately, it is the individual who is the unit This does not exclude dependence on, and willing help from neighbours or from the world It will be free and voluntary play of mutual forces Such a society is necessarily highly cultured in which every man and woman knows what he or she wants and, what is more, knows that no one should want anything that others cannot have with equal labour

"America is the most industrialised country in the world, and yet it has not banished poverty and degradation That is because it neglects the universal manpower and concentrates power in the hands of the few, who amass fortunes at the expense of the many The result is that its industrialisation has become a menace to its own poor and to the rest of the world

'If India is to escape such disaster, it has to imitate what is best in America and the other western countries, and leave aside its attractive looking but destructive economic policies Therefore, real planning consists in the best utilisation of the whole manpower of India .

"According to me, the (ideal) economic constitution of India and, for the matter of that, the world, can be universally realised only if the means of production of elementary necessaries of life remain in the control of the masses. These should be freely available to all as God's air and water are or ought to be, they should not be made a vehicle of traffic for the exploitation of others. Their monopolisation by any country, nation or groups of persons would be unjust. The neglect of this simple principle is the cause of the destitution that we witness today, not only in this unhappy land but in other parts of the world, too

—MAHATMA GANDHI

A White Elephant Called New Delhi

I have in mind certain monopolies legitimately acquired, undoubtedly, but which have been brought into being in conflict with the best interests of the nation. Let me give you an illustration which will amuse you somewhat, but which is on natural ground. Take this white elephant which is called New Delhi. Crores have been spent upon it. Suppose that the future government comes to the conclusion that seeing that we have got this white elephant it ought to be turned to some use. Imagine that in Old Delhi there is a plague or cholera going on, and we want hospitals for the poor people. What are we to do? Do you suppose that the national government will be able to build hospitals and so on? Nothing of the kind. We will take charge of those buildings and put these plague-stricken people in them and use them as hospitals, because I contend that those buildings are in conflict with the best interests of the nation. They do not represent the millions of India. They may be representative of the monied men who are sitting here at the table, they may be representative of His Highness the Nawab Sahib of Bhopal or of Sir Purushottamdas Thakurdas or of Sir Phiroze Sethna or of Sir Tej Bahadur Sapru, but they are not representative of those who lack even a place to sleep and have not even a crust of bread to eat. If the national government comes to the conclusion that that place is unnecessary, no matter what interests are concerned, they will be dispossessed, I may tell you, without any compensation, because, if you want this government to pay compensation, it will have to rob Peter and pay Paul, and that would be impossible.

THE IDEA THAT WAS GANDHI

EVIDENCE BEFORE THE HUNTER COMMITTEE

Q. You can resort to no other remedy to oppose the irresponsible, foreign officials and that is why you have started this movement. Is it not?

A. I cannot say that with certainty. I can conceive the necessity of *satyagraha* in opposition to the would-be full responsible government. Our ministers can never claim to defend themselves on the score of their ignorance, whereas such a defence is available today for the English officers.

Q. But with all the rights of self-government we shall be able to dismiss the Ministers.

A. I cannot feel, *on that point*, so assured for ever. In England, it often happens that ministers can continue in the executive even though they lose all the confidence of the public. The same thing may happen here too and, therefore, I can imagine a state of things in this country which would need *satyagraha* even under *home rule*.

Q. Would you think that there should be no unrest coming after the *satyagraha* movement?

A. Not only I do not think so; I would be disappointed if there were no unrest in case Anasuyabehn and I were to be arrested. But that unrest will not take the shape of violence. It pains a *satyagrahi* to see others suffering; *satyagrahis* will follow each other to jail. I *do wish* for such unrest.

—*Young India*

The President and the Physician

TASKS BEFORE MR VERGHESE

Will Planning Commission Measure Up?

WHEN DEFIANCE BECOMES DUTY

Even the most despotic government cannot stand except for the consent of the governed, which consent is often forcibly produced by the despot. Immediately the subject ceases to fear the despotic force, his (the despot's) power is gone. I would risk violence a thousand times rather than risk the emasculation of a whole race. Non-cooperation with evil is as much a duty as cooperation with good. No tyrant has ever yet succeeded in his purposes without carrying the victim with him, it may be, as it often is, by force. Most people choose rather to yield to the will of the tyrant than to suffer for the consequence of resistance. Hence does terrorism form part of the stock-in-trade of the tyrant. But we have instances in history where terrorism has failed to impose the terrorist's will upon the victim. Non-violence does not mean meek submission to the will of the evil-doer but it means the pitting of one's whole soul against the will of the tyrant. It is possible for a single individual to defy the whole might of an unjust empire. A civil resister is dangerous to an autocratic State, for he brings about its fall by engaging public opinion upon the matter for which he resists the State. Civil disobedience, therefore, becomes a sacred duty when the State becomes lawless, or, which is the same thing, corrupt. And a citizen who barters with such a State shares its corruption or lawlessness. The civil resister ever obeys the laws of the State to which he belongs not out of fear of sanctions, but because he considers them to be good for the welfare of society. But there come occasions, generally rare, when he considers certain laws to be so unjust as to render obedience to them a dishonour; he then openly and civilly breaks them and quietly suffers the penalty for their breach. And in order to register his protest against the action of the law-giver, it is open to him to withdraw his cooperation from the State by disobeying such other laws whose breach does not involve moral turpitude. Complete civil disobedience is a state of peaceful rebellion, a refusal to obey every single state-made law. It is certainly more dangerous than an armed rebellion, for it can never be put down if civil resisters are prepared to face extreme hardships. When you have failed to bring the error home to the law-giver by way of petitions and the like, the only remedy open to you, if you do not wish to submit to it, is to compel him to retrace his steps by suffering in your own person, that is, by inviting the penalty for the breach of the law. By its very nature, non-violence cannot "seize" power, nor can that be its goal, but non-violence can do more: it can effectively control and guide power without capturing the machinery of government. That is its beauty.

—Mahatma Gandhi

At the end of our task,
Let us proudly bring Thee our scars and
Lay at Thy feet
The soul that is ever free and
Life that is deathless

—Rabindranath Tagore

Remembering the Mahatm

OF ALL tyrannies, the worst is the secret despotism of thos who, while they tyrannise, appear to honour the rebe That Mahatma Gandhi is reduced to formal, even ceremoi ial remembrance year after year is tragedy enough. That authc rity is the central participant in this ritual is worse. Never ha there been an attempt either to comprehend or assert the idea which, more than all else, was Gandhi

Remembrance is glory when it is humble; when it is ceremon it is worse than humbug Honouring is fearsome, for it is almos a kind of telling the people to forget, now that the debt has bee paid Memorials are not a measure of grateful memory, bu of boastful condescension. When they are expensive, as the often are, the ostentation is a measure of insincerity.

The Gandhi centenary, eight years ago, by a unique coin cidence, was also the year of the fiftieth anniversary of Jallianwal Bagh How many in this country know that it was the firs major event of the Gandhi era? Only a week earlier in tha fateful April of 1919, Gandhi had given his call for a nationa hartal to protest against the Rowlatt Bills

Gandhi's appositeness in the April days was in his harmony with the national mood of protest. And what a unique protes it was! Out of this baptism rose a new nation. The "day of reckoning" of which Sir Michael O' dwyer had spoken was hastened by the magic of Gandhi.

The mad spree of murder by Sir Michael's picked British officers, the crescendo of revolt, the "calculated act of inhumanity" at Jallianwala Bagh, the dark deeds on the crawling lane, the aerial bombing of Gujranwala, the flogging, the crowning affront of Edwin Montagu's praise of Chelmsford and O' dwyer, the purse to the stupid general Dyer, and the House of Lords resolution—do these not remind us of a cynical cruelty by "native" rulers not long ago? Had those who were struck by the bullets in Amritsar died in vain? Where was the nation that Gandhi built?

IS THERE anything in our polity today, even after the magnificent and noble response of the people, which makes us feel assured that this nation built by the blood and toil of the martyrs to a cause, will not once again be subjected to the kind of insult which it suffered till not long ago? The infamous emergency, we are told, was legal (even as O' dwyer's death dance perhaps was) and the criminals, it would seem, are to be arraigned for their lesser follies Is this less of an affront to our people than what was offered by Montagu and the British House of Lords?

If we are loyal to the memory of a unique struggle led by a unique leader, we should treat treason as treason and not merely as ordinary wiles and stratagems of a political cabal. The mask of legality, hiding the true face of tyranny and megalomania, should be ripped, so that no one in future will dare hold our noble people in bond and yet go about as an honourable citizen seeking protection of the law.

(Contd. overleaf)

This, done without vengefulness and rancour and as a measure of duty to our heritage, is the least we can do if we wish to remember Mahatma Gandhi in this year of rebirth of a nation.

Tyrants rise and fall, and each new tyrant seeks to lull our sensibilities by an appeal to the baser instincts of national glory, order, progress and stability. The higher spirit of man rejects them, in fact fights against them.

If remembering Gandhi is at all necessary, its worth lies in renewing the truth that man alone can resist the tyrant, not the arms and that the journey never ends.

DR. LOHIA said the struggle of the future would be between Gandhi and the atom bomb. Mao's saying that this new weapon is a paper tiger is only a variation of Gandhi's : "Non-violence is the only thing that the atom bomb cannot destroy".

What both implied was that when a people decide to defy (as the great Vietnamese people did), even the most fearsome weaponry and the worst of despots are powerless. The atom bomb will have to contend with non-cooperation.

"No power, no State", said Gandhi. Since "the state can never be weaned from violence, to which it owes its existence", the initiative for the destruction of power cannot come from those whose sustenance it is. It can come only from the common people. The non-cooperation idea was Gandhi's unique contribution to the process of human confrontation. The Naxalites may do well to consider, if, along with Marx, Lenin and Mao, Gandhi also may give them some idea of how to fight against social, economic, political and cultural tyranny. They may find that, perhaps, besides being the most democratic, the Gandhi idea is also the most practical.

THE HUMAN struggle is always between the state representing organised violence and a people whose only strength is a resolve not to submit to any despotism. That struggle is not confined to India but this land of Gandhi has a duty by the world. □

Rolling Plan: New Responsibilities and Challenges

SHRI CHAVAN'S reaction to the rolling plan idea would seem to be more in the nature of the usual noises which an opposition party is supposed to make than a studied comment. Earlier some party advantage was sought to be derived from a criticism of orientation of policy towards employment and rural industry. A party claiming to have some respect for a man called Gandhi could at least have refrained from describing a bias for the small sector as primitive or atavistic.

It would seem that the Congress party has convinced itself that its policies have either led to or were about to lead to some kind of millenium; and is anguished, angry and helpless in the face of some sinister mischief to disturb this idyllic state of affairs The very least that was expected of this party was that it would get out of its world of make-believe, namely, that there was some aura of sanctity about its economic and social policies.

In any event, one does not see how perspectives are lost in any effort continuously to readjust sights. If anything, the rolling plan idea will ensure that short term adjustments, inevitable in any situation, will always fit into a longer and larger view of things. Every annual plan will be drawn up with an eye to the physical and financial targets for the following five years. Thus the advantage of five year forward planning, far from being given up, is sought to be retrieved from much ossification, as was often the case before.

The styles of the annual plan exercises had been a little cramped because they had to be fitted into some kind of straitjacket. With projections now sought to be continuously refined in the light of the achievements, constraints and challenges as they become apparent, looking ahead is likely to be more purposeful.

What is now being attempted is not a mere departure from practice. There is no need to be apologetic in saying that it is a radically new approach The scheme at once strengthens the role and participation of the Planning Commission in evolving social and economic strategies and in setting the tone of policy. Continuous evaluation and re-evaluation being the premise behind the rolling plan idea, the Commission's dynamism will be increased manifold. Planning ceases to be a one-time exercise in five years, and, becomes a process of fixing the sights continuously ahead, a process of improvisation, refinement and continuous forward movement with a great degree of sensitivity imparted to the entire idea of social development

THE ROLLING plan or the "roll-on" plan, as some have chosen to call it, at once not only invests the Planning Commission with a certain authority which it has not had so far but casts on it a heavy and exciting responsibility Its role in long term and short term policy formation is now crucial. This will call for a great deal of ingenuity, intensive home-work, ceaseless and unremitting vigilance and quickness of response. Details become at least as important as the overview.

While the controversy over the supposed devaluation of the Planning Commission will now be stilled, the rationale of its future existence will entirely depend on how it accepts the new challenges. Jawaharlal Nehru had, in his last days, been a greatly disillusioned man where the Commission was concerned. Speaking at a Science Congress session he remarked on the bureaucratisation of the planning idea. The Commission had become flabby and stodgy. An imaginative restructuring of the Commission's secretariat and functionalisation of its wings is immediately called for. Policy and execution are integral in one sense, but the Commission should not let executive responsibilities overwhelm its policy prerogative A new and meaningful relationship between the Commission and the administrative ministries will have to be worked out. Annual plan exercises are now ritualistic and *ad hoc*, often left to a mercenary civil bureaucracy with blinkered approaches. All this must change. A functional bureaucracy fully comprehending the ethos of the Commission has to replace the hierarchies in Yojana Bhavan.

The rolling plan should not induce a feeling that targets are expendable. Clearly they are not. They are set within a defined scheme of priorities and no irresponsibility or indifference can be permitted in the name of flexibility.

Planning, after all, is not an end in itself. It is not a field for academic cleverness. It is an instrument for realising within a reasonably short time some socially desirable goals. These goals must be well articulated. The rolling plan idea is a good starting point of an exercise in a ten or twenty year perspective to be broken into short and medium term targets. The yearly reviews and projections will then have the merit of a continuous movement towards a clearly understood social objective and even a quickening of the pace of this movement. Without this perspective and without a constant reminder of the goals of policy, planning—rolling or static—will be robbed of its social content and will end up as a management gimmick of a few smug experts satisfied with their cleverness and scholarship.

A polemical wordy duel about the validity of the new policy can be sidestepped if the policy is shown to work. Time is of the essence and the one indicator of earnestness will be the disappearance of leisureliness in the well-appointed rooms of Yojana Bhavan.

A MAJOR CRITICISM of the new government has been that, with all the bombast of a brave new world, it did not seem to be in a hurry and was drifting and dithering. The rolling plan idea, together with the discussion at the first meeting in July of the reconstituted Planning Commission, could well be setting the pace of a new policy.

The objectives of the new government have been repeatedly stated—full employment in the quickest possible time, faster development of agriculture and rural industries and full use of local resources, to mention a few. The policy frame for these objectives has to be radically new The new policy, judging from Shri Morarji Desai's address to the July meeting of the Planning Commission, would embrace new concepts of village environmental planning making for a high rate of intellectual, aesthetic, moral and spiritual attainment, new systems of education, appropriate population policies including aspects of migration, new administrative styles, a radical water management system, and, of course, a valid wages, incomes and prices scheme based on discipline, austerity and all round sacrifice

The Legal Hurdle

SHRI MORARJI DESAI has repeated his argument that the emergency, however unwarranted and otherwise reprehensible was perhaps not *illegal;* therefore, it was a little difficult to proceed against those who carried out this dastardly midnight attack on our polity.

Shri Desai readily concedes that some kind of codification of human rights is called for, but this is as yet an uncharted field Despite the great advance in the concept since the second world war, particularly through the efforts of the United Nations, there is much vagueness about how this concept can be given effect to

There has been much discussion about the validity of the Nuremberg trials. There are many who hold that the only sanction for these trials was the military victory of the prosecutors. The worst crimes against humanity under Hitler's orders were not denied. The violation of the various Geneva conventions and other codes of behaviour concerning war prisoners and people of occupied territory was also readily conceded. The criticism was that there was no universally accepted law upon which to proceed against the transgressors.

This was from where the Human Rights Commission probably took off. Subsequently, the field has been widened. Though the member countries readily subscribe to the laudable principles—as laudable as the Te[n] Commandments—they are as irreverently treated a[s] the scriptures by which almost everyone swears.

One readily understands the reluctance of govern[-] ments to give precision to their commitment to basi[c] rights. Nobody in power wishes to give up the right o[f] last resort to the *danda*

What then do we do? The tumbrils and guillo[-] tines after the French Revolution were possible becaus[e] a thoroughly new legality derived its sanction from th[e] nature of the revolution. Seeing what happene[d] in India during the nineteen months, one might wonde[r] what this song and dance was about concerning th[e] reign of terror.

Nothing of this kind has happened in India. Th[e] tyranny came to an end through what its perpetrator[s] admit to be a miscalculation or "let down" by the in[-] telligence. The surge of popular anger was either no[t] anticipated or discounted. Since the transformatio[n] of this anger into a vote did away with the necessity o[f] another kind of upsurge and revolt, one is stuck wit[h] a continuing legality that was the basis of the emergency

Though there is much force in the argument i[n] favour of special and retrospective legislation to mee[t] this rather unique situation, the mischief in such [a] procedure can also not be overlooked.

But are we so helpless? The underlying principl[e] in the Nuremberg trials—which has not been seriousl[y] disputed—is that nobody can take refuge in superio[r] commandment for an obvious act of illegality or in[-] humanity. JP's call to the police and the army is als[o] now seen in the proper light. This applies equally t[o] the civil service. It is unfortunate that the bulk of th[e] civil bureaucracy which not only caved in but overzeal[-] ously carried out the orders has been retained. Th[e] administrative styles remain intact. A simple act of trans[-] ferring all officials of key departments would have had [a] salutary effect Even this has been done in a niggardly ma[n-] nner. Others against whom more than a suspicion exist[s] of overzealous implementation of blatantly unethical ord[-] ers could have been suspended Specific inquiries wit[h] specific charges should have been ordered. It is not [a] question of proving the guilt. The psychological impac[t] of such measures (provided they were done on *bonafid[e]* grounds) would have been immense. Even now thi[s] can be done

Simultaneously, work must start on a charter o[f] inalienable rights. The rights and duties of publi[c] servants which will not be subject to despotic politica[l] dispensation should be codified in a constitutiona[l] enactment There should be no difficulty in getting [a] broad measure of political consensus.

Time is of the essence. Delay would dilute th[e] ethical spirit. One hopes that Shri Desai, whose co[-] mmitment to basic codes of conduct is transparentl[y] sincere, will go about this task with all earnestness, s[o] that the winter session of Parliament, besides rectifyin[g] the 42nd amendment, will also broadbase the cons[-] titutional safeguard against a repetition of the ninetee[n] months' wonder and its child prodigy. And some wa[y] should be found to teach an exemplary lesson to th[e] culprits so that the crime is not repeated.

The Shah Commission

FROM ALL available accounts, the Shah Commi[-] ssion is faced with a stupendous task. To wad[e] through the immense material would itself tak[e]

months. To sort this out is not going to be easy.

It is as well that the Commission has chosen only a few hundred complaints for examination.

Two pitfalls have to be avoided. The complaints, not taken up for examination, should not be thrown into the limbo. They should at least be made available in printed form for sale to the public. The other pitfall is that even the few hundred cases to be enquired into may get bogged down in a lot of legal legerdemain. The procedures must be at once just and quick. Objections can be recorded so that the aggrieved party can always have legal recourse later. The Commission should not tie itself in knots in a kind of over-enthusiasm for legal nicety At this rate, we may even not be able to say that there was an emergency.

More importantly, however, the Commission is running the risk of missing the wood for the trees. "Excesses of the emergency" is a very clever camouflage to hide the fact that the biggest excess was the proclamation itself. It is clear that this was done without prior cabinet decision The Commission, one presumes, will summon the members of the then Cabinet to find out how much they knew in advance and why they agreed to be taken for a ride What evidence did the Cabinet have to conclude that the State was imperilled, not merely an individual? This is important because the proclamation could not have been a sudden decision. A fairly elaborate and surreptitious operation could not have been carried out without some amount of planning. Who did this planning? How was the message conveyed to the officers throughout India? The previous Cabinet Secretary, the Home Secretary, the Director of Intelligence, State Chief Ministers and concerned officers of state governments should be able to say when they came to know of the what, why and how of this *mafia* operation

It is necessary clearly to establish if the emergency had any relation to the purposes for which the provision was incorporated in the Constitution. All apparent evidence leads to a suspicion that it was in aid of an individual, a family and a cabal This is the central theme, the core, the essence of the work of the Shah Commission. Subsequent events can throw light on the prior intent.

The police service association has done a signal service in organising two public seminars. Middle class prudery mercifully is not preventing the senior police officers from doing an honest exercise in self-introspection. This will be an asset for any enquiry. Other service associations can be depended upon to do their duty.

There is a fairly enterprising civil servant who went about saying that he knew how the Cabinet had given prior approval to the emergency. He has been mentioned in the White Paper on the media. Perhaps he may be able to say a little more about what he knew and could not have forgotten.

The demolition, the vasectomy, the genuflection of dignitaries before a spoilt boy are manifestations of a depravity whose origins have to be sought out. Was there a gang which planned every day new forms of sadistic delight? Evidence should not be difficult to get.

What made the press, Parliament and even the highest judiciary accept an extraordinary preversion of constitutional purpose? How did the apparatus of terrorism work? What subtler forms of emasculation were practised?

Enquiry into this basic question is the major task of the Shah Commission. There is a view that a separate Commission to go into this aspect should have been created, But there is some merit in assigning this task to the Shah Commission and in an integral approach to the entire question of how the basis of our polity was sought to be subverted. The Commission may be expected to devise a procedure for quickly arriving at the truth.

We would wish to say that the purpose of the Commission is as much to locate the crimes and the criminals as to expose the mechanism of subversion so that this country, its political system, the bureaucracy, the security services and the organs of free expression and justice can be better prepared to frustate any incipient sign of despotism in future.

Shri Bansilal Protests

IT IS GOOD that a lot is being said, not the least by Shri Bansilal himself, about the handcuffing business.

Leaders of the government, no less than the press, have not been tardy in their disapproval of this noxious practice

The former defence minister has perhaps overplayed his hand. His best friends should have advised him not to protest too much. On the other hand, by writing to the prime minister, he has made it appear that he is a case apart. Shri Desai promptly granted him an interview. This must have further discomfited Shri Bansilal who perhaps feels cheated of a chance to nurse a grievance.

It must have taken some gall for this gentleman to meet a person who, he said, was being fed very well in prison. There is, however, some irony in this search for humanity of one who, till recently, was not capable even of common decency. If he has learnt from experience instead of making it appear that his *amour propre* has been hurt, he should at least publicly acknowledge the graciousness of the people who have made it possible for even the tormentor to have his day in the court, which he might not have had under a regime which he himself buttressed

States Reorganisation

THE PROPOSED splitting of states into viable administrative units should not be limited to the bigger states—bigger in area or in population. The goals of policy should be as much to make for greater accountability to the people as to break linguistic tyranny. The vested interests are bound to make the task difficult but statesmanship lies in explaining the benefits to the people and securing their enthusiastic partisanship in a course which is of intimate concern to them. It would be useful to secure a consensus of the political spectrum. There might be a surprising degree of support.

While, as an interim measure, some of the states can be broken up, an exercise in basic policy should be simultaneously initiated. The policy parameters would include the possible constitutional basis for local administrative units and for enlarging the powers of the states in federal polity. Roughly one can envisage some six thousand panchayat samitis with clearly defined statutory powers. Ideally, if the United States, with a population of less than 250 million can have 50 states, we can have a hundred. However, it will be practicable to have some sixty states, each of a population of about ten million, barring some of the north-eastern and centrally administered territories. Thus, Tamilnadu, Andhra Pradesh, Maharashtra, West Bengal and Madhya

Pradesh can be split into five states each. Kerala, Karnataka, Gujarat and Rajasthan can be broken into three states each. Orissa and Assam can be split into two states each U.P. into ten and Bihar into six.

Each state will have roughly one hundred panchayati samitis. Two chambers, functionally different, will be useful. The house of the people for each state can have 200 members elected on the basis of constituencies of about 50,000 people or electorates of about 25,000 each. The council of panchayats can have 100 members, each panchayat samiti electing one nominee. The council of panchayats will not be a second chamber. It will deal exclusively with sub-federal issues, including the proper discharge of financial, administrative, judicial and developmental functions of the panchayats. It will ensure that the state governments do not usurp the powers and responsibilities of the panchayat samitis.

Similarly at the union level, the Lok Sabha can be elected on constituency basis and the Rajya Sabha can consist of two representatives elected by each state assembly. The Rajya Sabha will not be the second chamber but will look after federal matters over whick the Lok Sabha may not have any jurisdiction.

All this will work only if there is evidence of a ra dical approach to the problems of federalism and loca self-government. With this revolutionary dimension popular enthusiasm can take care of motivated oppo sition. Without it, political intrigue can frustrate it

The Idea That Was Gandhi

GANDHI is intact without his non-violence, but not without his non-cooperation, that is, resistance to authority generally and to its abuse, in any case. He is intact without his ideas on industry but not without his opposition to oligarchies of every kind. The integrity of his idea will not collapse with the collapse of Indian nationalism, though he was largely its architect; but it will disappear without his attack on centralised authority.

Gandhi's tragedy, in his lifetime and after his martyrdom, was that, despite a whole lot of books written on him and his ideas, most people know only of his conclusions and not of the steps that led to those conclusions. This may be the failure of those who wrote about him. This may be Nehru's failure in the sense that, apart from sanctioning the scheme for the "Collected Works" which can be no more (and no less, of course) than a source library, he did not encourage a systematised study of the ideas of a fundamental political and social philosopher. Nehru himself, unwittingly perhaps, reduced Gandhi to a mythical hero "The light that shone was no ordinary light". "He was tough as steel, yet gentle in the extreme". Or, differing radically from Gandhi on most matters, Nehru did not think much of encouraging Gandhian studies.

Then there were a whole lot of Gandhians who were content to project Gandhi as an apostle, sometimes of truth, sometimes of non-violence, but seldom of the people, of the down-trodden, of the "*daridranarayan*", of "the dumb millions".

The discussion of Gandhi in this country, has never been serious, not even a tenth as serious as the discussion of Marx, Lenin or Mao. Gandhi is generally regarded as the unique leader of a unique struggle against colonial rule, as a believer in truth and non-violence, as a passionate antagonist of the machine, as a person of great inner power—all of which only detracts from the intellectual force that Gandhi was and an almost wholly now political philosophy that he created equal to that of Marx or Mao.

The apotheosis of Gandhi by the self-proclaimed Gandhians has also blurred a discussion of his ideas as much as the wholly untenable thesis that while Gandhi represented some kind of primitive romance, Nehru represented "modernism" and "progress". The truth, perhaps, is the reverse, if only one went deeper into the utterances of the two. The leftists made the debate more difficult by the vehemence of their jargon.

DISSERVICE HAS been done to Gandhi by many widely-differing men and institutions but not as much, perhaps, as by Gandhi himself. He often used a language which appeared to be be evange lical like the Sermon on the Mount, forgetting tha he lived in an age when men were charmed by the me thodological language of western liberalism. Nehru in India, was the high priest of this liberalism and th appeal of his words was far greater than of Gandhi' ideas. Precisely for the reason that he was again industrialism (and organisation), Gandhi was again method. Logically, therefore, there is no Gandhis as there is Marxism. He himelf said, "If Gandism i another name for sectarianism, it deserves to b destroyed." "My aim is not to be consistent wit my previous statements on a given question but to b consistent with truth, as it may present itself to m at a given moment. The result has been that I hav grown from truth to truth".

And yet, while there is no Gandhism, there is th Gandhi idea or the idea of ideas

If the entire body of these ideas is taken togethe there is one continuous theme which will emerg namely, that all systems that consolidate power an authority are bad This led him to his fundament conviction that without the building of the people will to resist, all systems of power will degenerate fir into autarchy and then into despotism, constitution or otherwise. That will to resist, in the Gandhi schem transcends every ordinary discipline and obeys on the discipline not to be cowed down by the fact or threa of reprisal Hence, "real *swaraj* will come not by th acquisition of authority by a few, but by the acquisitio of the capacity by all to resist authority when it is abused In the absence of mass action, tyranny is bound to inhe in any organisation—that of establishment or of revo Present benevolence is irrelevant and in no case s fficient guarantee against creeping insidious tyrann Thus do rebels become tyrants when the rebellion itse is the work of a few. The people who are incidental t rebellion soon become irrelevant to governance. Th benevolence of democratic centralism is not the equ valent of people's power.

IT IS THIS that makes Gandhi irksome as muc to those in the establishment as to those rebellion. For he denies both the right to ru The vanguard theory of the Marxists was antithet to the non-cooperation idea because it does not bri the people into the scope of action. "Ends and mean was not an ethical principle but a basic political ten which lays down that what is achieved by a few will kept by the few, even if these few are more broad-base more generous, less avaricious and more well-meani than those whom they replace as the ruling class.

How do you contend with this man? Cut him

ize; make him "gentle", "non-violent", "truthful", pure", "very Indian" and generally irrelevant, more to e remembered than to be followed, more to be used as convenient distraction than to be understood and omprehended.

The problem with this toothless friar who wandered ı his loin cloth is that he cannot easily be ignored ough it is almost 30 years since he left us in peace. e is more than what the rebel and the ruler can accept. herefore, treat him as a Mahatma or a political crank. therwise he will create trouble for everyone who is ome one.

That is where the conspiracy begins. He is quoted r his peripheral values, not for the core of his mission. is village idea and his non-violence are nothing if they e not the banner of mass action against organised ranny. And if mass action and organised tyranny n both be taken care of in any other way, Gandhi at ast would have had no objection, not the Gandhians ie non-cooperation idea, which revolutionised Indian litics and which is his outstanding legacy, is the word-arm", if one might use the term in the Gandhian ntext, of mass politics without which there can be democracy. His *Satyagraha* is the safeguard against ery trend of authoritarianism. And his village ea is the guarantee against the despotism of power

To confuse them with ethics or economics is to miss e central idea of Gandhi. Urban parasitism has a sted interest in this distortion. Inherent in his scheme things is the primacy of people's sovereignty against te privilege. He was not content with romanticising e equality idea as the urban liberals tended to do. He ve socialism and democracy a basic and revolutionary rpose different from the mere mercenary objective material well-being. Such well-being was inherent his idea but the idea itself was more imporant— mely that the people should be the arbiters of their desty.

THUS THE INTEGRITY of the Gandhi idea will stand without nationalism, non-violence and even village economy, but it cannot stand without the sic ingredient of mass action and people's sovereignty. is this which is always under attack from concepts of agmatism, stability, tactics, strategy, efficiency, ornised justice and organised planning. These are the ncepts of centralism—legislative or administrative— d Gandhi's entire life was a battle against centralism. he was aware of its virtue, he was aware of its greater e. Not in authority alone but in revolt also, centram does lead to whimsicality, arbitrariness and opporaism with the result that the revolt collapses when organised part of it refuses to act for reasons of its m. The meaning of both non-cooperation and its ore active foil, civil disobedience—a weapon eminently mocratic and universally valid and applicable— that organisation is less important than the people.

NON-VIOLENCE WOULD belong to the inessential Gandhi, if some other method could be evolved whereby the people will always be in the centre of acn. Gandhi's non-violence is a corollary to his convict- ı that every other form of resistance would depend on ganisation. He had no objection to violence except it it is often senseless and vengeful and always ds to a new despotism. "For me," he told Nehru, is material to obtain the real article and the rest will l into the picture afterwards. If I let go the real ing, all else goes". He chose non-violence because will help obtain the real article. Terrorism, as he id, is the stock in trade of the tyrant, but once "the bject ceases to fear the despotic force" the tyrant's "power is gone". Non-violence helps every individual "to defy the might of an unjust empire" and "pit his whole soul against the will of the tyrant".

Gandhi is often regarded as some kind of sadist when he says, "Non violence, in its dynamic condition, means conscious suffering". The truth, however, would seem to be that the individual is no match to organised tyranny in the use of competitive violence. Either one waits for an organisation to develop and endure the tyranny while waiting for this messiah, or one makes it known that, even without arms, one will defy the despot's will. At that moment the despot collapses. In his evidence before the Hunter Committee, while arguing for the greater validity of *satyagraha* under home rule, Gandhi said he expected each *satyagrahi* to be followed by another. Though, in theory, it is true that an individual can defy an empire, what it implies is that when this spirit of resistance becomes general, there is little chance of a despotic force emerging. Thus, "A civil resister is dangerous for an autocratic state . . complete civil disobedience is a state of peaceful rebellion—a refusal to obey every single state-made law. It is certainly more dangerous than an armed rebellion. For, it can never be put down, if civil resisters are prepared to face extreme hardships".

Here Gandhi was trying to say that while force could be overcome by superior force, non-violence could be overcome only by superior non-violence, that is, only when the state ceases to do injury to the citizens. Once the state knows that there is this preparedness to defy, even at some cost to life and person, the state becomes powerless.

MAO'S PROBLEM, in a measure, was that the new bureaucracy had become powerful Hence the cultural revolution. Gandhiji's tragedy, as stated before, was that, not believing in the methodology of western logic, he stated his conclusions and the preceding steps in terse, aphoristic and almost idealistic terms with the result that his statements appeared to be in the tradition of "messiahs". So were Mao's statements in the eyes of I F. Stone who compared Mao's idea incentive as against material incentive to the homilies of the early Christian era.

When Gandhi spoke of violence and untruth in relation to urban civilisation, he was referring simply to the basis of that civilisation. Here again his tragedy was a refusal to yield to a form of presentation. When he said "cities", he meant the basis of the state structure, raised on city logic, the parasitism and oligarchy; that is, the untruth and violence it represents. It was his unassailable conviction that a state raised on such a logic may be anything—progressive if you like, modern may be or even benevolent—but it is neither freedom nor democracy and Gandhi believed unreservedly in both.

He said "Anyone who wants to do good should not hold power". He differed from Marx in the sense that whereas Marx thought that the first step to human emancipation was capture of power, Gandhi wanted to get there by first destroying power, or at any rate, by building people's strength to fight it in all its forms. It is in this context that while industrialism was basic to Marx, its destruction was basic to Gandhi.

One can accept or reject this; but one must at least understand the idea.

Gandhi did not completely reject Bolshevism, in whose principle of non-possession, he saw the application of the ethical ideal. He called Lenin the master spirit and hoped that, despite the violence, "the purest sacrifice behind Lenin's ideal" and "the noble example of re-

nunciation" would "quicken and purify the ideal" as time passes.

Gandhi was hesitant in this hope because he also said that since Bolshevism did not preclude the use of force but freely sanctioned it, the Bolshevik regime "in its present form cannot last long".

It is a debatable point whether the people have come into their own in Lenin's land or whether much of Lenin remains. Have "economism" and "development" helped in the quickening and purifying of the ideal or has the pursuit of material objective led to the diminishing of the revolutionary fervour?

It is difficult to assert. But there can be little dispute that the people, in whose name Lenin overthrew a chafing yoke sixty years ago, have now become incidental to governance.

A VIEW COULD be that in the world in which we live, the Gandhi idea will not work But it is at least necessary to know what that idea is, namely, that non-violence was conceived as the most practical form of mass action. Gandhi realised, however, that the weaker classes in the caste-ridden Indian society cannot, on their own, succeed unless they were joined by others Thus at Champaran, "by allying myself with the weak party, by teaching him direct, firm but harmless action, I made him feel strong and capable of defying the physical might". Along with his non-cooperation idea came the thesis of "change of heart". In fact, during his time, he was able to enrol a good number of caste Hindus to take up the Harijan cause. Much mischief has been done in emphaising his trusteeship theory as the core of his economic philosophy whereas it properly belongs to his political philosophy of change of heart In economic matters he was clear. He would not leave the economy in the hands of "trustees", and his writings abound in his definite belief that where any kind of large scale production is necessary, it should be in the sphere of social ownership and control. If he rejected organisation as tyrannical, he rejected individual benevolence as irrelevant

It is remarkable how, amidst his theorising and leading the anti colonial struggle, he started a number of organisations like the Talimi Sangh, the Harijan Sevak Sangh and the all India Spinners' Association They were run by constructive workers with commendable efficiency. He believed in this kind of cooperative management and would have shuddered to think that social and economic movements, any more than political movements, could be left to trustees

HIS OPPOSITION to centralism in economics as in politics was based on his conviction that this would degenerate into expert exercise in which the people would have little say—a perfect setting for the ascendancy of elite oligarchy. He wanted to create an awareness of this incipient despotism, without which the people would lose the battle every time and there was always the chance and almost always the fact of a client people being outsmarted by the elite. Neither efficiency nor even honesty could be sufficient excuse for the denial of the right of the people to govern or misgovern. That was the meaning of his saying that he would prefer anarchy to unwanted government. Without mass participation, even a well-meant socialised sector would become a bureaucratic sector with all its jargons of returns, economic operation, growth rate and the rest. Not that Gandhi was against efficiency; but he was for subordinating it to people's control. Planning as an *efficiency* concept should come to terms with planning as a people's concept. If it is not something more than "projections" and "perspectives," the efficiency logic is bound to result in compromises with urban pressure groups and in pampering strategically-placed sections constituting an unproductive parasitic minority.

Gandhi had no particular quarrel with the urban idea. His views on self-contained village republics based on cottage industry and simplified basic education were part of an integrated philosophy rooted in the sovereignty of the people. One may not agree with the details of the philosophy, but the philosophy itself compels attention.

Gandhi did not reject the material circumstance altogether; but he wanted the human circumstance to assert itself. He was anti-machine only because the machine brought with it a social structure in which, with all the benevolence of the ruling class, man either was irrelevant or had to fit into one system of the other.

GANDHI RECOGNISED that representative democracy was inevitable in a technological society. The logic was relentless If poverty could not be wiped out except by industry, industry could not be built except by large governments, and large governments could not be sustained except by representative democracy. This in turn meant delegation of authority and authority implied submission. Authority, having established itself to be necessary for progress, would assert its role for order and, what was worse, for national greatness. Therefore, the small approach would have to give place to the big approach.

If the reverse logic was to be followed whereby people would transcend institutions, one had to start with where the vice began Police power as a transcending state obligation and benevolence as the functional role of the elite led not only to the rule of law which was made inseparable from the rule of the *danda* but also to urban parasitism, modernised consumption, distribution of patronage among this parasitic urban middle and upper middle class and above all politics based on power. All of this flowed in irresistible logic from the system of government by representation and the rationale behind this system was the logic of industrialism. Hence, "my concern is to destroy industrialism at all costs", because Gandhi did not want people's sovereignty to be reduced to elite paradise.

GANDHI'S OUTSTANDING contribution to Indian nationalism and political unity was that he transformed it from an imperial administrative concept to one of popular aspiration. 1919 is the year of great divide, the year when the people of this country, from end to end, felt, acted and responded as a single political entity. Indian integration was essentially based on the Gandhi movement This is true as much of territorial integration as of its political content. Almost overnight, as it were, Gandhi made Indian nationalism comprehend the whole of Indian geography. Before him neither pervasive religion nor ubiquitous authority provided the avalanche of national fervour which, under him, swept all administrative, regional, and linguistic barriers. At freedom, the Indian mind had been conditioned by more than a quarter century of Gandhi to regard the land bounded by the Himalayas and the seas as something more than a physical entity held together by the Hindu religion. Intellectually and emotionally, this political nationalism had been so strongly woven into the Indian consciousness that its significance was somewhat lost in the character of naturalness imparted to it by the momentum of the Gandhi movement. The Republic, one and indivisible, was not the climax of conquests and acquisitions. It was not an accident of power and adjustment. It was the consummation of a political process under Gandhi.

TRAGICALLY, HOWEVER, the Constitution which gave expression to this nationalism which Gandhi, more than most, fashioned, failed to reflect his basic philosophy of how that nationalism might flourish in a continuing circumstance of popular fervour and participation. The extent to which Indian nationalism is sought to be reduced to a mere administrative exercise is reflected in the kind of elite argument that goes on about centre-state relations. These arguments of strength, stability, efficiency and even constitutionality are an attempt to go back to the imperial concept of unity and rob it of the essential ethos of popular aspiration. This is not a problem of framework or formulae. A formula not based on a basic philosophy of Indian nationalism may be clever but will not work. If Indian unity is not a matter of law and security it is also not an instrument of economic development. Neither prosperity nor strength makes a nation. Its sanctity must derive from a deeper involvement of the mass of the people in its many expressions The sanction is not the constitution but the people. Essentially the problem of centre-state relations is how far authority will be surrendered to the people. This process can never end

Gandhi's village scheme may not be a complete constitutional structure. It is an idea It may have several weaknesses. If centralism makes for oligarchy, a narrow local authority may not even have the saving grace of benevolence. A local tyranny can be even more fearsome than a centralised autarchy. The problem is one of approximation, refinement, remedy If the village idea cannot be turned down on grounds of practicability, it can not be rejected on grounds of rural malevolence either Some kind of dualism of sovereignty and control can be tried. In any event, this is a question of political philosophy, not of administrative legerdemain.

THE GANDHI idea may be full of pitfalls. It is often said that without Gandhi, his scheme just does not work. All this may be true. But there must be comprehension of the idea before its usefulness and limits are considered. In many areas, as in employment, Gandhi provides a yardstick of judgement. Within his scheme, arguments like economics of scale (a greatly disputed premise) acquire a new place and purpose.

"Thinking big"—that is what is perhaps needed provided this is not a totem of modernity. But thinking in smaller ways is also not bad. Gandhi, for all his village idea, was not such a small man.

It is a pleasant but futile exercise to speculate on what Gandhi would have done if he had lived longer. It is tempting to say that it was good that he died when he did; otherwise he might have lived to see the India of his dreams crumbling around him On the other hand, he wanted to live up to 125 years. He might not have come immediately into conflict with Nehru. But he had a peculiar way of pressing with his idea. It is almost certain that he would have organised the Indian equivalent of the cultural revolution. Mao lived for 27 years after assumption of political power. Gandhi died within six months of the British departure Had he lived the world might have witnessed a unique encounter between his and Mao's ideas All this may be idle speculation, but the fact remains that Gandhi did not have the chance which Mao had of trying out his ideas Much of his life was taken up with anti-colonial and anti-racist struggles He did not live to test the validity of his more basic mission

That perhaps was the tragedy of January 30, 1948. R.K.

Gandhi the Writer

—Kaushik

AN ASPECT of Gandhi has been understressed in the many books that have been written about him. Even as late as 1945, Nehru, in writing to him, adopts a superior position, as if to say that Gandhi was over-simplifying things : which might not have been bad, were it not for an undertone of sympathy or rather pity for this well-meaning, but simple individual unversed in the logic of the age.

Urban India accepted Nehru more than it accepted Gandhi, not merely because Nehru, with his frequent reference to technology and the rest, seemed to be looking ahead, but more relevantly because his biographers had never omitted to mention his wide reading and living contact with leaders of contemporary thought beginning with his participation in the European get-togethers in the anti-imperialist cause; whereas most biographies of Gandhi, beginning invariably with his three promises to mother Putlibai, set him against a less catholic and more austere background

Gandhi might have been more readily accepted by the urban "intelligentsia", if his unique inner development had been shown to be what, indeed, it was—the product of a fascinating encounter with the best minds of the age, both through books and through intimate personal meetings. Gandhi, no doubt, was largely a "first principles" man. At first he exasperates you with his "obstinacy", till you get to know him better. And when you do, you begin to marvel at his persevering patience. In his time, which was nearly up to the time the bullet struck him, he had done about as much reading as most others in his position had or would have done; and had met more people than most men in his position had perhaps done.

But there was a difference. Where others might have been swept off their feet, he seldom gave in until he was fully converted. Two excellent collections of essays on the Soviet Union are available, one written by Nehru after his 1927 visit and the other written by Tagore who had gone to that country a little later Nehru was no less thrilled than the poet, and both were romanticised by what was, without question, an enchanting human accomplishment. It is, however, very doubtful if Gandhi would have written about the Soviet Union in the same romantic vein, if he had the occasion.

Gandhi subjected every experience of his to the severest test of his reasoning, and it so happended that he accepted not very much and even this he assimilated in his dialectic, with the result that, for all his understanding and receptivity, he appeared to be puritanically austere.

BHABANI BHATTACHARYA'S "Gandhi, the Writer" (centenary publication of the National Book Trust) mentions a curious aspect of Gandhi's stay in London. The closing years of the nineteenth century had witnessed a widespread ferment of ideas in Europe London was seething with it when Gandhi spent his time mostly in the vegetarian movement. There were the Fabians, the Webbs and Shaw, the anarchism of Kropotkin, Marxists all over the place, the revolution wrought by Darwin, Havelock Ellis and Esward Carpenter, the suffragists and the rest. Yet Gandhi, living at the epicentre of these movements, does not seem to have felt

the heat of the new quest.

It is, of course, possible that with his consuming concern over religion, "which was three parts ethics", he stood apart from the "big upheavals". What seems more probable is that Gandhi merely refused to be overwhelmed by the new ideas. He was prepared to take note of them, consider them dispassionately and correlate them with his "first principles". One thing was clear even at that early stage. He was not going to be victimised by industrialism and all the egalitarian and humanistic concepts that flowed from industrialism. For him there was the basic dilemma of a contradiction in terms; ethics and humanism had little to do with the growing technology. All the new ferment in Europe did not seem to go far in resolving this basic contradiction. Years later Gandhi was to take up this question with Bertrand Russell, Richard Gregg and even with Henry Ford, if I remember right. All that Russell could say was that, while he would not dispute Gandhi's premise, industrialism was like a force of nature which even India would not be able to resist. Gandhi was constantly troubled by this seeming compulsion.

It would, therefore, be an oversimplification to say that he stood aloof from the current social movements. However, Bhabani Bhattacharya appears to be entirely right in another matter. Gandhi did exaggerate the influence on him of Ruskin, Thoreau and Tolstoy. "In each case", as Joan Bondurant is quoted by Bhattacharya, "the influence was that of corroboration of an already ethical precept, a crystallisation of basic moral pre-dispositions". In Louis Fisher's words, Gandhi "co-authored the impression the book played on him".

THIS, THOUGH, would only seem to confirm what has been said earlier—that while he was prepared to read almost everything and listen to anyone, he would only accept what appeared to him to be fundamentally true. He was not prepared readily to compromise—a quality he shared with Lenin.

All of which leads Bhattacharya to recall what has been said of Gandhi. 'He never *read* books, he *studied* them". Similarly one might say that he never met people; he tried to understand them and be understood by them; and as with men, so with events.

If books alone could have moulded a man, they should have moulded Gandhi. Starting with Bentham's *Theory of Utility* and Henry Salt's "*Plea for Vegetarianism*", he went through Howard Williams and his genre, before arriving at Sir Edwin Arnold. (Incidentally, this was his introduction to Gita). Then followed Blavatsky, Christian literature and appro priately Carlyle. Early during his sojourn in South Africa, he read eighty books on Christianity besides a host of books on other religions. Edward Maitland impressed him greatly at this stage, and, truly, there was some correspondence between the two. Simultaneously he was reading a lot of books in Gujarati, mostly with a religious bias. Tolstoy's "*Kingdom of God is within You*" was to come afterwards and Ruskin's "*Unto this Last*", even later. He took Socrates in his stride of prison reading. He read an account of the Sufis and during this period was impressed by Saadi's "*Gulistan*". During the "Phoenix days", he started on Huxley, Bacon and Stevenson, besides Emerson and Mazzini, and went back to Carlyle for his *French Revolution*. Sanskritic literature had been almost always wth him.

This was the foundation of a more varied and intensive reading to come. Thus in two years in Yeravada he "studied" a hundred and fifty books, widely differing from one another—Scott, Ben Jonson, Goethe, H.G. Wells, Bernard Shaw, Kipling. To give only a few of the titles : Gibbon's *Decline and Fall of the Roman Empire*, Heckel's *Evolution of Man*, Bacon's *Wisdom of the Ancients* Geddes' *Evolution of Cities*, Laski's *European Morals*, Rosebarry's *Life of Pitt*, Tagore's *Sadhana*, Shah's *Man and Superman*, Goethe's *Faust* and Kipling's *Barrackroom Ballads*.

IN THE meantime, Gandhi was becoming a world phenomenon and was perforce to meet a bewildering number of people, each a leader in his right—Rolland, Chaplin, Shaw, Laksi, Hewlett Johnson, Tagore, loyd George to mention a few. Whether it was Sewagram in India's deep interior or Kingsley Hall, where he characteristically stayed during his London visit for the Round Table Conference, there was an unending stream of men coming to meet him. His discussions were seldom other than intense.

It is this aspect of Gandhi,—his living contact with men and books—that provides the backdrop for Bhabani Bhattacharya's wholly worthwhile addition to Gandhi literature. Bhattacharya, I suspect is not a Gandhian, not wholly having rejected materialistic ideas and has, therefore, the advantage of objectivity. His appreciation of Gandhi does not, therefore, suffer from fanaticism. He is able to see Gandhi wholly and in stages, and he does not need to apologise for marvelling at the great evolution.

Bhattacharya's great merit is in not reducing his book to a critique. He lets the personality of Gandhi take shape and thus is able to present the writer as part of the man, particularly because in this case there was little room for "make-believe" artistry

Reading, meeting and struggling, Gandhi was evolving himself and "nothing could be more creative than the piece of sculptural work he carved out himself". Yet this "passage of a common man to one of the greatest figures in world history" had taken place without any "conscious effort on Gandhi's part to find a place for himself among the great ones of the world". The words flowing from such a man naturally stand as a record of an "amazing inner development".

And it seems that almost from his first visit to London, Gandhi had never ceased writing. He was much less than twenty when he scribbled his London Diary. He soon was writing to *The Vegetarian* and even at that early age had gone a long way in mastering a simple style of saying things forcefully. For instance, "There are millions in India who live on one pice, that is, one third of a penny a day.... these poor people have one meal per day and that consists of stale bread and salt, a heavily taxed article". From the start, he wrote only purposefully and was concerned the least about embellishing his words. "Every day of his sojourn in London was dedicated to some stern, implacable purpose".

SOUTH AFRICA quickened his mission, and one also sees a great increase in his writing. First two pamphlets, next a book (during a brief visit to India in 1896) and then the avalanche through *Indian Opinion*. In the first two years of the journal, Gandhi had written five hundred articles and notes.

Young India, Navajivan and Harijan,—his immense correspondence and the books including Hind Swaraj written in 1908 and the Autobiography. The vigour of his writing and its literary power steadily grew with each stage of his inner development. And all through, there is a strange communative power.

"I write as the spirit moves me at the time of writing— Often my vanity dictates a smart expression.... it is a terrible ordeal but a fine exercise to remove the weeds". If John Middleton Murray regarded *Hind Swaraj*" as the greatest book written in modern times, he had been moved as much by the authenticity of the idea as by the genuineness of the language.

As Bhattacharya points out, it is astounding that the flow of Gandhi's writing never slackened during the long years. He wrote in Gujarati also, though naturally he wrote more in English, in which language his wordage must be a few million. "I do not wish to forget that language (English)", Gandhi wrote in 1948 a few days before the assassination, "nor do I wish all Indians to give up or forget it....English is the language of the world....Imperialist rule....will go....But the superior role of the English language cannot go".

Edward Thomson wrote, "Perhaps his (Gandhi's) unsurpassed command of English idiom comes from his perfect control over his mind....I have never met an Indian who had mastered them (the prepositions) as Gandhi has". He had "neither the time nor the inclination to cultivate the so-called art of writing", as another critic notes. "No straining after emphasis, no colour, no irradiating brilliance. Yet they are *Gandhi's words* and their very bareness constitutes their strength". T.H. Holmes said that since he wrote with disciplined simplicity, the result was the one most important quality of literary art—namely, clarity. And Erikson speaks of the "passion, piognancy and the humour in his use of English".

GANDHI'S IMPACT on the Indian languages had been great, both "through his writings and through his movements". His contribution to modern Gujarati literature has been signal. His *Atmakatha*, according to K.M. Munshi, has its place among the best works in Gujarati prose. As Bhattacharya himself remarks, Gandhi was a writer's writer, inspiring creativity on a big scale.

"Gandhi, the writer", as he emerges from Bhattacharya's distinctively written book is an integral part of the man himself ; which is not a truism, for a lot of writing is a camouflage of the man behind the mask.

The book makes easy reading. Some less known facts serve to lighten the narration which is never auster. Charlie Chaplin shocked the guests at Winston Churchill's country house where he was staying with his bald statement that he was meeting Gandhi. Lloyd George recalled to Louis Fischer the black cat which sat on Gandhi's lap during the latter's visit to his Surrey residence and which appeared again only when Madelene Slade visited the liberal leader. Bernard Shaw was uncharacteristically modest when he described himself as mere Mahatma minor. Romain Rolland speaks to Gandhi warmly of Lenin "who, like you, never compromised with truth".

THE ACCOUNTS of Gandhi's various meetings with eminent men in London are lively, and the quotation from Edward Thompson's accounts of a meeting when Gandhi was cross examined for three hours by the Master of Balliol, Gilbert Murray, Sir Michael Sadler and P.C. Lyon is interesting. "Not since Socrates", says Thompson, "had the world seen his equal for absolute self-control and composure....He has never been taken in by his own legend....He arrogates no dignity to himself. He will pull your leg and enjoy having his pulled in return".

Gandhi was, after all, not so naive or credulous ! In any event not a romantic, which, ironically, Nehru, with all his love for the modern, very much was.

Gandhi-Nehru Letters

Reproduced below are extracts from three letters exchanged between Mahatma Gandhi and Jawaharlal Nehru in October and November 1945.

Writing on October 5, 1945 Gandhi said :

"The first thing I want to write about is the difference of outlook between us. If the difference is fundamental then I feel the public should also be made aware of it. It would be detrimental to our work for *swaraj* to keep them in the dark. I have said that I still stand by the system of government envisaged in *Hind Swaraj*. These are not mere words All the experience gained by me since 1908 when I wrote the booklet has confirmed the truth of my belief. Therefore, if I am left alone in it I shall not mind, for I can only bear witness to the truth as I see it. I have not *Hind Swaraj* before me as I write. It is really better for me to draw the picture anew in my own words. And whether it is the same as I drew in *Hind Swaraj* or not is immaterial for both you and me. It is not necessary to prove the rightness of what I said then. It is essential only to know what I feel today. I am convinced that if India is to attain true freedom and through India the world also, then sooner or later, the fact must be recognised that people will have to live in villages, not in towns, in huts, not in palaces. Crores of people will never be able to live at peace with each other in towns and palaces. They will then have no recourse but to resort to both violence and untruth. I hold that without truth and non-violence there can be nothing but destruction for humanity. We can realise truth and non-violence only in the simplicity of village life and this simplicity can best be found in the *charkha* and all that the *charkha* connotes. I must not fear if the world today is going the wrong way. It may be that India too will go that way and like the poverbial moth burn itself eventually in the flame round which it dances more and more furiously. But it is my bounden duty up to my last breath to try to protect India and, through India, the entire world from such a doom. The essence of what I have said is that man should rest content with what are his real needs and become self-sufficient. If he does not have this control he cannot save himself. After all, the world is made up of individuals just as it is the drops that constitute the ocean. I have said nothing new. This is a well-known truth.

"But I do not think I have stated this in *Hind Swaraj*. While I admire modern scinece, I find that it is the old looked at in the true light of modern science which should be reclothed and refashioned aright. You must not imagine that I am envisaging our village life as it is today. The village of my dreams is still in my mind. After all, every man lives in the world of his dreams. My ideal village will contain intelligent human beings. They will not live in dirt and darkness as animals. Men and women will be free and able to hold their own against any one in the world. There will be neither plague, nor cholera nor small-pox; no one will be idle, no one will wallow in luxury. Everyone will have to contribute his quota of manual labour. I do not want to draw a large-scale picture in detail. It is possible to envisage railways, post and telegraph offices, etc. For me it is

material to obtain the real article and the rest will fit into the picture afterwards. If I let go the real thing, all else goes.

"On the last day of the Working Committee it was decided that this matter should be fully discussed and the position clarified after a two-or three-day session. I should like this. But whether the Working Committee sits or not I want our position vis-a-vis each other to be clearly understood by us for two reasons. Firstly, the bond that unites us is not only political work. It is immeasurably deeper and quite unbreakable. Therefore it is that I earnestly desire that in the political field also we should understand each other clearly. Secondly, neither of us thinks himself useless. We both live for the cause of India's freedom and we would both gladly die for it. We are not in need of the world's praise. Whether we get praise or blame is immaterial to us. There is no room for praise in service. I want to live to 125 for the service of India but I must admit that I am now an old man. You are much younger in comparison and I have, therefore, named you as my heir. I must, however, understand my heir and my heir should understand me. Then alone shall I be content."

Nehru's reply was sent four days later. He said :

"Briefly put, my view is that the question before is not one of truth versus untruth or non-violence versus violence. One assumes as one must that true co-operation and peaceful methods must be aimed at and a society which encourages these must be our objective. The whole question is how to achieve this society and what its content should be. I do not understand why a village should necessarily embody truth and non-violence. A village, normally speaking, is backward intellectually and culturally and no progress can be made from a backward environment. Narrow-minded people are much more likely to be untruthful and violent.

"Then again we have to put down certain objectives like sufficiency of food, clothing, housing, education, sanitation, etc. which should be the minimum requirements for the country and for everyone. It is with these objectives in view that we must find out specifically how to attain them speedily. Again it seems to me inevitable that modern means of transport as well as many other modern developments must continue and be developed. There is no way out of it except to have them. If that is so, inevitably a measure of heavy industry exists. How far that will fit in with a purely village society? Personally I hope that heavy or light industries should all be decentralised as far as possible and this is feasible now because of the development of electric power. If two types of economy exist in the country there should be either conflict between the two or one will overwhelm the other.

"The question of independence and protection from foreign aggression, both political and economic, has also to be considered in this context. I do not think it is possible for India to be really independent unless she is a technically advanced country. I am not thinking for the moment in terms of just armies but rather of scientific growth. In the present context of the world we cannot even advance culturally without a strong background of scientific research in every department. There is today in the world a tremendous acquisitive tendency both in individuals and groups and nations, which leads to conflicts and wars. Our entire society is based on this more or less. That basis must go and be transformed into one of co-operation, not of isolation which is impossible. If this is admitted and is found feasible then attempts should be made to realise it not in terms of an economy, which is cut off from the rest of the world but rather one which cooperates. From the economic or political point of view, an isolated India may well be a kind of vacuum which increases the acquisitive tendencies of others and thus creates conflicts.

"There is no question of palaces for millions of people. But there seems to be no reason why millions should not have comfortable up to date homes where they can lead a cultured existence. Many of the present overgrown cities have developed evils which are deplorable. Probably we have to discourage this overgrowth and at the same time encourage the village to approximate more to the culture of the town.

"It is many years ago since I read *Hind Swaraj* and I have only a vague picture in my mind. But even when I read it 20 or more years ago it seemed to me completely unreal. In your writings and speeches since then I have found much that seemed to me an advance on that old position and an appreciation of modern trends. I was, therefore, surprised when you told us that the old picture still remains intact in your mind. As you know, the Congress has never considered that picture, much less adopted it. You yourself have never asked it to adopt it except for certain relatively minor aspects of it. How far it is desirable for the Congress to consider these fundamental questions, involving varying philosophies of life, it is for you to judge. I should imagine that a body like the Congress should not lose itself in arguments over such matters which can only produce great confusion in people's minds resulting in inability to act in the present. This may also result in creating barriers between the Congress and others in the country. Ultimately, of course, this and other questions will have to be decided by representatives of free India. I have a feeling that most of these questions are thought of and discussed in terms of long ago, ignoring the vast changes that have taken place all over the world during the last generation or more. It is 38 years since *Hind Swaraj* was written. The world has completely changed since then, possibly in a wrong direction. In any event any consideration of these questions must keep present facts, forces and the human material we have today in view; otherwise it will be divorced from reality. You are right in saying that the world, or a large part of it, appears to be bent on committing suicide. That may be an inevitable development of an evil seed in civilisation that has grown. I think it is so. How to get rid of this evil, and yet how to keep the good in the present as in the past is our problem. Obviously there is good too in the present.

"These are some random thoughts hurriedly written down and I fear they do injustice to the grave import of the questions raised. You will forgive me, I hope, for this jumbled presentation. Later I shall try to write more clearly on the subject."

Early in November 1945, Gandhi and Nehru met to discuss their views on the matters mentioned in the two letters. Writing about this meeting to Nehru on November 13, 1945, Gandhi said :

Our talk of yesterday's made me glad. I am sorry it could not be longer. I feel it cannot be finished in a single sitting, but will necessitate frequent meeting between us. I am so constituted that, if only I were physically fit to run about, I would myself overtake you, wherever you might be, and return after a couple of days, heart-to-heart talk with you. I have done so before. It is necessary that we understand each other well and that others also should clearly understand where we

stand. It would not matter if ultimately we might have to agree to differ so long as we remained one at heart as we are today. The impression that I have gathered from our yesterday's talk is that there is not much difference in our outlook. To test this I put down below the gist of what I have understood. Please correct me if there is any discrepancy.

(1) The real question, according to you, is how to bring about man's highest intellectual, economic, political and moral development. I agree entirely.

(2) In this there should be an equal right and opportunity for all.

(3) In other words, there should be equality between the town-dwellers and the villagers in the standard of food and drink, clothing and other living conditions. In order to achieve this equality today people should be able to produce for themselves the necessaries of life, that is clothing, foodstuffs, dwellings and lighting and water.

(4) Man is not born to live in isolation but is essentially a social animal independent and interdependent. No one can or should ride on another's back. If we try to work out the necessary conditions for such a life, we are forced to the conclusion that the unit of society should be a village, or call it a small and manageable group of people who would, in the ideal, be self-sufficient (in the matter of their vital requirements) as a unit and bound together in bonds of mutual cooperation and interdependence. ☐

WHAT HE STOOD FOR

What is industrialism but control of the majority by a small minority ? There is nothing attractive about it, nor is there anything inevitable in it. If the majority simply wills to say "no" to the blandishments of the minority, the latter is powerless for mischief.

I wish too, you would dismiss from your minds the views attributed to me about machinery In the first instance, I am no more trying to present for national acceptance all my views on machinery than I am presenting the whole of my belief in non-violence The spinning wheel is itself an exquisite piece of machinery My head daily bows in reverence to its unknown inventor. What I do resent is the wanton and wicked destruction of the one cottage industry of India that kept the wolf from the doors of thousands of homes scattered over a surface 1900 miles long and 1500 miles broad.

What I object to is the craze for machinery, not machinery as such. The craze is for what they call labour saving machinery. Men go on saving labour till thousands are without work and thrown on the open streets to die of starvation I want to save time and labour, not for a fraction of mankind, but for all. I want the concentration of wealth, not in the hands of a few, but in the hands of all. Today machinery helps a few to ride on the backs of millions. The impetus behind it all is not the philanthropy to save labour but greed. It is against this construction of things that I am fighting with all my might.

—Mahatma Gandhi

GANDHI THE BANIA

NEWSPAPERS reported recently that someone considered herself in the happy company of Gandhi (the Mahatma, of course) in the matter of a bad head for accounts. Fortunately the Mahatma escaped being banded together with this very esteemed person about "not collecting funds". Gandhi did collect funds—almost greedily, one might be tempted to say. His hand went out at every meeting to collect whatever came. Many were poor beyond words who gave him of their "riches". Once, on a tour of Orissa, speaking of the poverty of its people, he said "I have collected soiled pies from them tied tightly in their rags, and their hands were more paralysed than mine were at Kolhapur".

He did need funds—not for his political work, definitely not. He had his Harijan Sewak Sangh and a host of other organisations he started and ran efficiently with the help of voluntary workers or those who were paid so meagrely that they were not very different from honorary workers.

"I am a *bania*", he used to say often. The reference was as much to his collecting the money as to his keeping a very strict control over its spending.

Once he wrote rather vehemently of the financial affairs of a Congress committee in Andhra Pradesh. The accounts did not tally and Gandhi, true to form, did not spare the president of the committee for negligence but not worse. This poor chap, honest as the day, wished to protest his innocence before Gandhi and went to Wardha. Gandhi told him that the issue was not one of honesty but of the greatest care where public funds were involved.

The visitor from Andhra lingered. So far as the Mahatma was concerned, the interview was over. He had other things to do. Our man from Andhra suddenly blurted out, "I have no money to go back".

Gandhi, known for his mercilessness, asked, "Why did you then come? You could have explained in a letter. In any case I have no money of my own. You can walk back to Andhra".

The poor fellow went away.

Quietly a benign figure also left the room and returned after a while.

Gandhi looked at him, smiled and said, "I know what you have done, you gave him the return fare. That was partly why I could afford to be so ruthless. But I don't agree with you".

This gentle figure was none other than C.F. Andrews, known to millions as *Deenabandhu.*

The President And The Physician

Sahadeva

THE SPONTANEITY of good wishes for the President's quick recovery from his ailment is a measure of the esteem and affection in which he is held by the people of this land. After his firm resolve to move out of Rashtrapathi Bhawan, nobody will believe that he wished to have his treatment abroad. Very obviously the President and the Cabinet were guided by medical advice.

However, a controversy has now arisen from the statements of some well-known medical specialists. If the 'President's decision was based on incorrect advice and the prime minister's statement at a news conference on wrong data given to him, government, the medical association and other professional bodies may be expected to go into this and take appropriate action.

More pertinently, two questions remain to be settled to the people's satisfaction. One is to make it clear that government would no longer wake up only when a VIP has to be treated and start ordering the much-needed equipment. The second is to assure the people that two kinds of treatment would no longer be allowed to exist in this country--one for those who can afford because of their status or wealth and the other for those who cannot.

Very often one reads of the high cost of treatment at Delhi's medical institute. Sometimes a newspaper collects funds; sometimes a minister like Shri Advani donates. Afterwards, all is forgotten.

Overhauling the Health Ministry

The whole system of medical education, hospital administration and budgetary allocations for public health and treatment has to be revamped. Not only are the hospitals overcrowded but the doctors and nurses are overworked. The general wards are sometimes among the most insanitary places in a hospital. Neither the patient nor the doctor is satisfied.

If Shri Raj Narain means business, he must overhaul his ministry, do away with its stupid hierarchy, engage immediately in immediate consultations on a whole range of health problems and take quick decisions.

First a committee should look into the minimum of nurses and doctors—GPs and specialists—and the minimum of dispensaries and hospital beds needed; secondly there should be a study of how quickly dispersal of the medical facilities can be brought about; thirdly, a committee should go into hospital administration, delegation of financial and administrative powers to hospitals, location and design; fourthly, the entire requirements of equipment, medicines and maintenance should be worked out; it is scandalous that sometimes the patient or his relative is asked at the last moment to procure a medicine; fifthly, a good public relations system—not the slick cocktail P.R. men strutting about—to guide the public should be worked out; the people should know where and how they can go quicklly in an emergency or for specialised treatment; sixthly, all distinctions between men of status and means on the one hand and those of honest insignificance and honest poverty on the other should be abolished in government-run hospitals; this perhaps is not immediately possbible but a target date of expanding the facilities should be set when this can be done; seventhly, the budgetary requirements of public health, medical education, OPD and in-patient treatment and allied matters should be assessed; the allocation of funds for this purpose must receive high priority; eighthly the Indian Medical Association or a similar body and its literature should be made more functional, if necessary by law.

It is amazing that in a country where brilliant young men and women are groping for a worthwhile purpose, the doctors and nurses are overworked. The problem cannot and should not be one of money.

Degenerate Administrative System

The problem of health and treatment is only an index of the degenerate administrative system which sanctifies office comfort to the neglect of areas where the administration meets the people. Unless th prime minister attends to this aspe of the matter, he may find that a his good intentions will continue t be no more than good intention A thorough overhaul of the admini trative system, culture and styl has been the crying need of th country for decades. Yet this precisely the area which has bee neglected by successive government Today the administration is litt more than a hunting ground careerists. Administration, far fro being a help, is often a burden. is not a question of posts, wh should hold them or how much the should be paid. It is a question simplifying the structure, makir it sensitive, result-oriented and re ponsive to the people's needs, ab lishing the status symbols and hi rarchies, promoting a partnershi system and punishing the smart an slick operators. Delhi's life sty so much perverts public prioriti and this life style is, to an exten set by the administration. If Sh Desai is true to Mahatma Gandh the best homage he can do to h memory is to reverse this order things.

Need to Protect Public Servan

While on this subject, one migl as well suggest that controversi over the treatment of JP and Lohi or over the exoneration of a surgeo should not be joined in public b ministers and M.Ps. There a other ways of ascertaining the trutl We must remember that publi confidence in doctors can be greatl weakened by these controversie Besides, the poor doctor is em barrassed every time he meets patient. A quiet inquiry, a revie and a quiet decision will meet th ends of equity and justice in mo cases. Where the public have right to know, the final decision ca be announed after the leaders o all recognised parliamentary group had been taken into confidence.

One hopes that in matters o food for the starving and treatmen for the ailing, this country has see the last of political pettifogging.

Broadcasting Commission: Some Suggestions

Krishna Chandra

THE VERGHESE Commission will have to be careful not to tread the beaten track of predecessor bodies including the Chanda Committee.

Autonomy is a much abused concept; particularly in this country. Various statutory bodies have often overstepped their legitimate fields, taking shelter behind the elaborate procedure for their impeachment. Without an objective and simple system of accountability, autonomy could be a new tyranny.

The Commission should not be victimised overmuch by precedent. There is a great temptation in this country to cite the BBC example. The tasks as well as the power of broadcasting in India are vastly different from what they are in the U.K.

The first business of the Commission should be to devise a simple administrative pattern for broadcasting, eminently suited to a creative organisation. The hierarchies with their extra-functional roles can have little place in any field of modern administration and less so in broadcasting and T.V A clear distinction should be made between policy, recruitment, coordination, field and evaluation. There should be no overlapping jurisdictions. Thus, the Board should be no more than a policy making body with no powers of recruitment, regulation or executive direction. Recruitment should be done by an independent Commission, which should function subject to law so that it does not claim immunity for gross acts of patronage and worse. The discussions and policy decisions of the Board should be made public. There should be very little or no secrecy in the functioning of the Board.

No Hierarchy

Programme coordination and administration should be made functional and not hierarchical. The equivalent of the Director General will not be a super boss and will be no more than a coordinator giving effect to the decisions of a multidisciplinary apex coordination body consisting of engineers, newsmen and other kinds of programme personnel. The coordination body will function within the policy framework of the Board.

This is possible only if the separate hierarchy of broadcasting administrators is done away with The three important branches—engineering news and general programming—should have identical carreer policies and the senior-most personnel of these branches should form the committee, with the chairman rotating among them and having neither a special status nor special powers beyond carrying out the decisions of the Committee. Residual powers can vest in the chairman subject to post-facto ratification by the coordinating committee which can meet once a week

This can be the pattern at the headquarters as well at the stations. At the stations as well as some of the other field offices like the news division at the headquarters, the field functions should be autonomous, in the sense that once the policy is made known and the coordinating committee has issued the guidelines, the day to day functioning should not be subject to direction from a higher body

Ensuring Accountability

The evaluation body should be equally autonomous. This will oversee whether the policy decisions have been adhered to or deviated from, enquire into complaints of deviation, evaluate the impact of programmes and make periodical reports to the Board. The Board may also request the evaluation body to enquire into any particular matter.

There must be a separate and autonomous disciplinary body which may also discharge vigilance functions. The Board may refer to this body individual cases of deviation from policy so that the vigilance body may enquire into these and other complaints and recommend action which may then be decided upon by the coordinating body subject to the appellate jurisdiction of the Board.

This is without prejudice to the disciplinary powers of the executive and supervisory officers whos excercise may be subject to appeal t a separate administrative tribunal

These are matters of detail. Wha is paramount is that autonom should be inseparable from accoun tability. This is possible only i each body has a specific responsi bility instead of an omnibus bod having diverse responsibilities.

It would be useful if the Leade of the Opposition in the Lok Sabh is the Chariman of the Board an if the Board includes nominees o all the recognised parties in Pa liament besides eminent men o letters, fine arts, community educa tion, engineering and social science and some ex-officio invitees from th engineering, general programming an news functions of broadcasting. Th Board should meet at least once i two months, preferably once month. The Board may submi an annual report which will b discussed by Parliament. Such di cussion should not be subject t party whip.

With the autonomy of TV an broadcasting, the Ministry of I & B should be *completely* diveste of its responsibilities in these field The reports to Parliament will b routed through the parliamentar affairs department. The financia allocations will be directly discusse by the Board with the Plannin Commission and the Finance Mi nistry.

The vexed question of whethe TV and broadcasting should hav two separate organisations can b easily disposed of. The Board, th coordinating body, the recruitmer commission, the evaluation organ sation, the vigilance committee an the administrative tribunal shoul be common. All else will be fiel organisations, except that in ou present state of resources, it somewhat extravagant to have tw separate news divisions at the head quarters or at the stations.

Planning and development will b a separate functional field operatin directly under the Board, subject t financial parameters decided upo by the Board in consultation wit the Planning Commission and th Finance Ministry. Even here, constellational as different from hierarchical pattern should be re commended.

Breaking a National Monolith

All this is on the basis of a mo nolithic structure of broadcasting an TV. This need not be. There a strong case for a separate TV an

broadcasting board for each state, responsible to the state legislature under the broad framework of a central law. This will at once introduce competition without extra investment. This will have the further advantage of a rapid expansion of broadcasting and TV to reflect and satisfy the cultural, social, economic and political aspirations of the people. We should think of a thousand transmitting stations within ten years or so.

Organisational patterns will not be difficult to work out. Recruitment to the officer cadres can, however, be through a central commission as in the case of all-India services. There can be separate synchronised transmitters for the central body so that the stations need not be obliged to relay the programmes. The financing of the stations can be shared by the state and central governments through matching allocations so that the states may have an interest in expansion of broadcasting and TV.

The external services can be administered by a separate Board responsible to Parliament through the Ministry of External Affairs which can have policy and financial control of the Board subject to law.

BROAD SOCIAL PURPOSE

Preoccupation with political overtones of these media should not obscure a large area of entertainment, educational aids, community education and social development wherein these media have a great role to play. Great thought will have to be given to the provision of community radio and TV facilities in every village. The staff employed on maintenance can also be some kind of multipurpose health-assistants - cum-communicators. Special programming institutions will have to be set up continuously to devise software for community education free from political controversy or fashionable urban predispositions.

The Verghese commission should not lose sight of the broad social purpose of its tasks in its eagerness only to release the media from political stranglehold.

The whole question of advertising on TV and broadcasting should be reviewed, becuase of the possibility of the advertisers greatly influencing media policy. The expenditure on a basic infrastructure for social development should be a charge on the public exchequer.

The commission will also do well to consider whether there is not a morbid weakness for politics in radio and TV. Not more than four news bulletins in a language need be broadcast, nor more than an average of twenty minutes a day on newsreel, interviews, commentaries, parliament commentary and the rest. Some emphasis on sports may do all the good in the world. Books, science and the like should have a share of the spoken word programme. More than everything, the media should seek to educate the people in how they are governed or misgoverned

ORGANISATIONAL PATTERN

Briefly the organisational pattern and functions envisaged are :

The Board: Policy, study of evaluation reports; remittance of complaints arising from evaluation reports to the vigilance committee; appellate jurisdiction in respect of decisions of the coordinating body on the recommendations of the vigilance committee; report to Parliament; discussions with Planning Commission and Finance Ministry on the budget; and allocations of the budget to different wings. (If more than one board is decided upon each board will have these functions and the central board will have *no* authority over them)

The Recruitment Commission : Framing of recruitment rules; promotion policies; and recruitment of officers. The Commission's findings will be binding, but appeals against its findings will lie to the administrative tribunal on the basis of a parliamentary enactment. (The commission will recruit officers even if more than one Board is contemplated and will decide on transfers on tenure to the central organisation; otherwise, sub-ordinate staff will be ecruited by local commissions)

The Coordinating Body : This will coordinate the execution of the policy decisions of the Board and will also be the disciplinary authority in respect of the recommendations of the vigilance committee. This will be so for every such body attached to every autonomous board.

The Evaluation Organisation : This will, on its own, or on a public complaint, or on a complaint from the Board, enquire into complaints of deviations from policy, study the impact of the programmes and report to the Board as often as it considers necessary. Each autonomous board will have an evaluation organisation.

The Vigilance Committee : This will review the evaluation body's findings as remitted by the Board, enquire into complaints, from any source, of corruption and malpractice and make recommendations to the coordination committee concerned.

The Administrative Tribunal : This will hear appeals from the staff against any disciplinary or administrative action or malpractice by the Recruitment Commission and give its findings. Its decisions will be final. However, since there will be all-India services of officers, decision of state tribunals will be subject to appeal to the central administrative tribunal. These tribunals will be headed by persons qualified to be appointed judges of the High Court or Supreme Court.

DELEGATION OF POWERS TO THE FIELD

The field organisations should be clearly specified. Their executive actions can be subject to review only by the evaluation organisation or administrative tribunal in the first instance. Funds voted for them will be their exclusive responsibility to spend. Each field organisation will have a finance officer to ensure that the monies are spent for the purposes for which they have been allocated Budgeting should be highly efficient. The field organisations will be clearly accountable for deviating from policy and from the purposes of financial allocations and for mismanagement of personnel or equipment. Each station should be headed by the senior most officer in a station/region. All programme, news and engineering staff will receive administrative and professional training from time to time

TRAINING, STAFF INSPECTION, PROCUREMENT, R & D

An autonomous central staff training college with powers of drawing up the schedule of in-service administrative and programme training from time to time may be recommended. For each board, a staff inspection unit to ensure that the staffing is neither more nor less than necessary and to look after proper and equal career management of all the three financial branches should be set up. This unit will function continuously. Organisations to devise programmes and for planning and development will function under the Board or boards. An autonomous central hardware research organisation making recommendations to the board or boards may be set up. Procurement of equipment and parts should be by se-

parate autonomous bodies functioning under well-defined law.

If each state has a board, the central organisation will be very compact and manageable. There will be greater scope for functionalisation. To ensure that there are no opportunisms, a body on the lines of the press council can be set up under a parliamentary statute to hold the errant units to account in terms of the statute. A federal body of the chairmen of the boards can take care of problems of federal coordination.

Finally, the remuneration and the present staff. In recent years a fashionable theory has been allowed to gain ground that good broadcasting can be had only if good money is spent. This has led to patronage and parasitism. All broadcasters, eminent or otherwise, should be paid only uniform and very modest fees, perhaps not more than Rs. 25. This will discourage patronage and parasitism, bring out the best in our writers. poets, commentators and artists and broadbase participation in the programmes. The state's duty to encourage or patronise art and literature is a feudal idea. However, the state may have a duty to come to the rescue of genuine artists, writers and poets who are indigent. There are ways of doing this duty other than through special fees for broadcasting.

A Great Opportunity

As for the present staff while transitional arrangements may be necessary, their sectional interests cannot override a policy of profound national consequence. One hopes that populism will not interfere with a sensible policy. Similarly clerical and house keeping jobs should be greatly reduced.

In short this is a great opportunity for the Verghese Commission to recommend a whole new administrative and creative culture. The composition of the commission has raised high hopes.

to launch the haunting
spiritual
"Jail is Beautiful".

Rural Health Scheme

THE NEW rural health scheme being launched on Gandhi Jayanti lays stress on the preventive aspect. The community health worker (CHW) will be chosen from among the local community. In fact, what is being launched on Gandhi Jayanti is the training of the first batch of 20 community health workers from selected primary health centres. The services of these workers will be available only after the training is over. There will, therefore, be a time lag between the launching of the scheme and the availability of services through CHWs

Since the CHW is to be chosen by the community for its own benefit, it is hoped that the community will take a lot of care in choosing the worker. He should be acceptable to all sections of the community and should have not only an aptitude but the time for serving the people. Since his main task will be to educate the community in preventive and promotional aspects of health, it would be useful if he is chosen from among those who are already engaged in such public service as a local practitioner of any system of medicine, a village *dai* or a school teacher, provided, of course, he or she is found otherwise suitable and acceptable.

It is necessary for the people to know that this CHW is not meant to be a qualified doctor. They should not expect from him highly technical services for all their ailments and other medical problems.

What the CHW can and will do is that he can take care of minor ailments, give first-aid and relief and help the people to get in touch with the primary health centres and other medical institutions for proper diagnosis and treatment of chronic and serious conditions.

What CHW Can And What He Cannot Do

It is important for the community to know what the CHW can do and what he cannot do, otherwise high expectations are likely to be raised and there will be resentment and disappointment if these expectations are not fulfilled. In such a situation, the purpose of the scheme is likely to be defeated.

The CHW will often be a person of limited education. He is being trained for three months in preventive and promotional aspects of health, and in giving information on the health services available in an area. Since medical care facilities are not available in many villages, the CHW will be trained in giving relief for minor ailments, as already stated. For this purpose, he will have a kit of remedies and medicines.

The entire idea of the scheme to make the people aware of t importance of health care. Th is not sufficient knowledge now the curative and rehabilitative s vices available in the nearby are This knowledge will have to imparted to them so that there m be the best use of the availa services for the overall improvem of community health.

A Community Effort

The government comes in o by way of helping the program to be managed by the commun itself. It would be open to t community to look for a person w has some formal education, at le up to the matriculation standa In tribal and backward areas so relaxation may have to be made

The great merit of the rural hea scheme is that it is not rigid. recognises that in a country great variety of custom and usa wide variations will be both ne ssary and desirable

As the scheme progresses, CHW will acquire some limi knowledge of curative methods. manual will be given to him enable him to perform his functi well. At the moment, it is proposed to entrust him with i munisation tasks. His work be monitored by multipurpose wo ers who will also give him guidan

In order that the training may useful, special training manuals being prepared.

In short, the new rural hea

scheme is nothing more than a humble effort to promote among the community an awareness of the importance of some rudimentary health care measures and to give the community the help of a person who will have some training and greater access to those who cantreat the people for more serious ailments. The origin of this scheme is in the recognition that a lot of health problems can be solved by preventive measures. It is in this area that a great deal of health education has to be imparted to the people. In villages and in some areas of towns, environmental sanitation is poor, drinking water is not safe and personal hygiene is almost totally neglected. If these defects are remedied, many communicable diseases can be prevented. In chronic ailments like TB and leprosy where the treatment is prolonged, people will have to be educated in following the treatment regimen prescribed by the doctor. In these and other smaller ways the CHW can be of crucial help to the people

EXTENSION OF MEDICAL SERVICES

The larger question of extending complete medical facilities to the villages remains. Despite the exhortations of leaders, it has not been possible to persuade the doctors to go to the villages in any appreciable numbers. Some objective system has to be devised for this. The government hopes to find a solution in consultation with the Medical Council of India, the Indian Medical Association and other official and voluntary bodies. The solution would include incentives in the form of better facilities of life like housing for the doctors, as indeed for other functionaries in the village areas.

At the moment medical care in the villages is of the most meagre kind. Rural housing does not conduce to better health. The villages and urban slums have been the hunting ground not only of epidemic diseases but of ailments resulting from nutrition deficiencies. Improvement of health of the people is not only good economics but good politics because only a healthy people can assert their rights.

The first efforts in improving rural health were made in the twenties of this century. Gandhiji's emphasis on simple and effective rural development measures increased public awareness of the problems of the people of the villages.

It is only after the advent of freedom, however that more serious efforts were made in this direction. We now have a network of 5,372 primary health centres, each centre headed by a doctor or two and helped by a score of para-medical staff. Even so, overwhelming sections of the people do not have the basic health services. The doctor-patient ratio in the villages is very low.

IMPORTANCE OF PREVENTIVE MEASURES

It is in this context that the rural health scheme has to be viewed. To begin with, slightly under 800 PHCs will be covered. In 28 districts where the multi-purpose health workers training has been completed, the entire district will be taken up. It is hoped that within two years the scheme will cover all the villages. Its success will depend on how much the community itself recognises the importance of simple methods of sanitation as well as prevention of diseases and promotion of health care. This alone will make a big difference in the morbidity and mortality patterns in the country.

"We Want Industry, but........"

The other day, an American friend, Professor Sam Higginbottom, writing to me upon a subject in which both he and I are deeply interested, said—'I give you the substance of the letter—I don't believe in a religion bereft of economics. Religion, to be worth anything, must be capable of being reduced, when necessary, to terms of economics'. I entirely endorse this remark with a big mental reservation.........Whereas religion, to be worth anything, must be capable of being reduced to terms of economics, economics, to be worth anything, must also be capable of being reduced to terms of religion or spirituality. Therefore, in this scheme of religion-cum-economics, there is no room for exploitation and for Americanisation as the technical term is known. As a distinguished son of India put it he is no other than Sir M. Vishveshwarayya—whereas an Englishman owns 30 slaves—or is it 36 ? I speak subject to correction—an American owns 33 slaves. Personally, I think there is no room in true economics, which is convertible with religion, for the owning of slaves whether they are human beings, cattle or machinery. There is no room for slavery in economics.

As a moderately intelligent man, I know that man cannot live without industry. Therefore, I cannot be opposed to industrialisation. But I have a great concern about introducing machine industry. The machine produces much too fast, and brings with it a sort of economic system which I cannot grasp. I do not want to accept something when I see its evil effects which outweigh whatever good it brings in. I want the dumb millions of our land to be healthy and happy, and I want them to grow spiritually. As yet for this purpose, we do not need the machine. There are many, too many idle hands. But as we grow in understanding, if we feel the need of machines, we certainly will have them. We want industry, but let us become industrious. Let us become more self-dependent, then we will not follow the other peoples lead so much. We shall introduce machinery if and when we need them. Once we have shaped our life on ahimsa we shall know how to control the machine.

—Mahatma Gandhi

SIKANDAR BAKHT'S PLAN

IT IS A LITTLE flattering to feel that the ideas of *Yojana* on ministerial palaces are in line with official thinking. Readers may be a little intrigued about the sequence of our comments and Shri Sikandar Bakht's news conference. The simple fact is that the mechanics of bringing out a government journal are not very different from those of our planning process. A journal from *Yojana Bhavan* can be expected to capture the leisurely pace of the thinking, acting and reviewing that goes on in its sprawling floors. The simple fact is that it takes almost a month for what is written to get printed.

In any event we can assure our readers that *Yojana's* comments on Delhi's ostentation were written at least a week earlier than the Minister had spoken.

Our satisfaction ends at Shri Sikandar Bakht's decision to evict the ministers and senior officers from their bungalows. Otherwise, his ideas are capable of further refinement. He has said something about the ministers' houses having residential offices. It is to be hoped that second thoughts will prevail. A home, as the English say, is one's castle, shielded from the hordes of visitors. Except for a small study (six feet by eight feet at the most) where a personal assistant may receive urgent calls, record the requests for appointments and otherwise spare the minister from the routine chores of office, there is no need of any residential office. The personal assistant may sit in the room between six and eight in the morning and six and ten in the evening.

It is a peculiar status symbol of the Indian administrative system that ministers and administrators take home a pile of office work. Perhaps the first lesson to be learnt by these VIP's is that office work should not be done at the house.

A separate bungalow with many spare rooms will precisely convert the home into a *dharmasala*. The lawns will be filled with visitors and the rooms with all manner of guests making life miserable for the ministers. A functional and modest flat with all the modern comfort—not luxury—is the ideal both for austerity and for that kind of domestic relaxation which our hard-pressed ministers sorely need.

Is there really need of new construction? It is not a question of economy. The idea of a ministerial colony jars. It should not be difficult to find fifty flats or units of buildings (not bungalows) scattered over Delhi's many avenues and colonies to satisfy all the functional needs of ministers. The simple way of solving the problem of present occupants is to abolish fifty of the senior civil service posts in course of time. This will add to efficiency.

Shri Sikandar Bakht wants to pull down the present bungalows. It is a laudable idea to vacate the private buildings wherein government offices are located at high rents. The racket of involvement of government officers with private house owners is one of Delhi's crying scandals. But this vacating of private buildings need not be at the cost of Lutyen's spatial concept. There is nothing feudal or extravagant in pleading that Delhi's u[nique]queness among the world cap[itals] be preserved. Already some [da]mage has been done. More [van]dalism will be almost sacrilegi[ous]. Various social uses for these [bun]galows consistent with the envi[ron]ment should not be difficult [to] find. As for offices in pri[vate] buildings, perhaps many of t[hem] may be found less than us[eful]; some may be sent out of D[elhi] thereby relieving Delhi's hou[sing] problem, and one big multi-stor[eyed] complex may be built on the [out]skirts of Delhi.

Shri Sikandar Bakht has [held] out hopes of 30,000 new flats [in] New Delhi for government serva[nts]. This will gravely imperil [the] scheme of pruning Delhi's bu[rea]ucracy to size. One would [have] thought that the Janata Party, [with] its bias for the villages, w[ould] have a plan for reducing [the] parasitism of a non-functional [bu]reaucracy of Delhi. This ap[proach] to invest on buildings in D[elhi] will be a travesty of prioritie[s in] a country like ours. A whole b[ody] of social philosophy is availa[ble] which not only frowns upon [me]tropolitan madness but stro[ngly] pleads for reducing the size of cities.

A suggested routine for ministers

Our ministers, judging from newspaper reports and also from the experience of those who have watched them, cannot call even a minute their own; which is why probably this country is often in a state of tension.

It would be good if the ministers (central and state) organise themselves into a trade union and demand an eight hour day, a five day week, a three week month and a eleven month year. Good as much for them as for the country. A suggested routine will be as follows:

Get up at five in the morning, do exercise, walk, meditate and relax till seven, spend an hour reading newspapers or with children, have breakfast and reach office at 8.30. Interview with the *Janata* till 10.30, files till 12.30, lunch and relaxation till 14.30, official conference till 16.00 tea till 16.30, interviews by appointment till 18.00 hrs, back home by 18.30, a quick wash, some outing with family, dinner at 20.30, relax and go to bed at 22.00 or 23.00 hrs depending upon one's personal preference.

No work on Saturdays and Sundays. One week every month for tours. One month every year for a complete holiday.

It is absurd to think that an e[xtra] three hours a day helps in disp[osal] of a great deal of work. The [new] system will work only if establis[hed] notions of personal secretariat [are] abandoned. For a minister t[here] is no personal secretariat as s[uch]. The entire ministry is his pers[onal] secretariat. The size depends [on] the fucntions. A functional [dis]tribution on the basis of a mi[nis]ter's concept of his work, the ass[em]bling of a blend of experience [and] youth without a hierarchical sche[me], a clear understanding of the [dis]tinction between policy, coord[ina]tion and field functions, evolvin[g a] system of monitoring, institu[ting] a system of subject-wise files [of] decisions handed down by mini[ster] at his official conferences, g[oing] over these decisions and their im[ple]mentation at every subsequent [con]ference and, above all, ma[king] everyone know that the mini[ster] is the boss who will have the ch[oice] of his secretariat subject *not* to s[ervice] procedure but to the Prime Mi[nis]ter's approval—this and a little n[ore] will make the minister effec[tive,] relaxed and useful to society.

Rural Economy Should be Basis of Industrial Growth

—*Ajit Kumar Singh*

CONSIDERING THE way in which a shift in development priorities is being advocated, one fears that agricultural fundamentalism may replace industrial fundamentalism. Neglect of any sector would be clearly a mistake in the present Indian context.

In the early stages of growth every nation faces the problem of determining correct development priorities, specially between agriculture and industry. Swayed by the glamour of the industrialised countries, development planners took industrialisation to be synonymous with economic development not only in India but in most developing countries. The problems of agricultural development tended to receive lesser attention. The result was that in spite of the establishment of several modern industries and other symbols of development, there was hardly any change in the rural conditions. Burgeoning cities and expanding urban slums went on along with decaying villages This forced the planners to reconsider the approprirateness of their policies in several countries

When India took to the path of planned economic development in 1951 she had two choices—either to follow the path (which Russia had adopted with conspicuous success) of pushing headlong with a big programme of heavy industrialisation; or to try which had not been tried before but was in tune with the Indian tradition, namely, transformation of the rural economy Broadly these two paths can be called the Stalinist and Gandhian paths respectively. Under the dominating influence of people like Nehru and Mahalanobis, the Planning Commission chose the Stalinist path. The mainstream of the Indian economists justified this strategy, though there were stray voices which regarded this strategy as inappropriate for the country.

Errors of Strategy

There are indeed weighty arguments in favour of the heavy industry strategy. For self-reliant and self-sustained growth we need basic industries like steel, chemicals and machine building. Adequate natural resources are available in the country to support their creation. Chronic balance of payment disequilibrium precluded the option of large scale import of capital goods. A succession of good crops in the early fifties and the easy availability of concessional food aid further made this strategy more attractive. The heavy industries have also contiibuted to defence capabilities.

However, the development strategy based upon basic and heavy industries erred on three important grounds. First, it led to a relative neglect of agriculture and rural and small industries, thereby keeping a very large segment of the national economy outside the growth processes. The shortfalls in agricultural production have time and again jeopardised the smooth pace of development of the national economy. Second, the emphasis on capital goods and long gestation projects led to a serious imbalance in the demand and supply of wage goods contributing to inflationary pressure and generating widespread labour unrest Third, there has been a lack of proper co-ordination between the growth of the heavy industries and the requirements of other sectors of the economy In particular the pattern of industrial expansion did not serve the ends of agricultural development The result was a glut of capital and intermediate goods at times, while the general economy remained at a low level of development The technical and industrial capabilities developed over the years had to seek an outlet in the foreign markets

These are indeed serious failures which justify a fresh look at our development strategy. A particular development strategy should not be regarded as something sacrosanct. It should be flexible enough to take into account the changing economic scene. What was justified at a particular stage need not be so at a different stage. Moreover, our options were quite limited to begin with. Today the ability of the economy to manoeuvre and experiment is greater than in the past.

Priority for agriculture and small industry is a sound idea, provided this does not imply absolute neglect of big industry. The choice is not between industry and agriculture or between small and large industry but between balanced and lopsided development. A sudden break with the existing pattern of development is not possible and created capacities cannot be allowed to remain idle.

The rural and the industrial sectors cannot be treated as unrelated parts of the economy. Success in ending rural poverty depends in a large measure, on the overall capabilities of the entire economy and the state of industrial progress. Similarly infra-structural facilities are as necessary for agriculutre as for industry. Only by strengthening the secondary and the tertiary sectors can we hope to revitalise the rural economy.

Need to Correct Urban bias

Financial allocations for a particular sector are only a rough indicator of its relative importance. For one thing, the allocations for other sectors contribute directly or indirectly to the development of the sector in question. Moreover, there is the problem of absorptive capacity of each sector, which depends, among other things, on the availability of well-prepared projects and programmes as well as the capacity of the administration to carry them out. In the case of agriculutre and small industry, organisational and institutional changes are likely to help more than direct financial allocations. Even more important than the financial provisions is the attitude of the concerned people towards the development of any sector. Leadership can play a crucial role in bringing about the required attitudinal changes.

Our plans have had an urban bias since the beginning as most of the planners and the officials entrusted with plan implementation have an urban background. It is this inherent urban bias in the plans which must yield place to a rural bias. The biggest challenge before the Planning Commission is the evolution of a pattern of industrialisation which helps in the modernisation and development of agriculture and rural industries that is, a pattern which would not be a mere instrument of economic exploitation of rural resources The guiding principle should be the extent to which they serve the needs of the rural economy. If we succeed in this task, we will be able to make a visible impact on the living standards of the rural masses within a decade or so. A dynamic and prosperous rural economy will in its turn strengthen the process of rapid industrialisation. □

Integrated Rural Development Some Policy Issues

—*J.G. Srivastava*

NO PROBLEM today is as great as poverty and backwardness in rural and remote areas. ere is significant gap between the ral rich and rural poor in India. meet this alarming situation tegrated Rural Development programme has been conceived. While e present efforts in this direction e making their own contributions, any policy issues arise as whether ey reflect the best ways of tackling e massive problem of poverty and ckwardness in rural areas. The her related issues before us are :

(i) what do we mean by rural backwardness and poverty and what is the poverty level/lines,

(ii) what is the method of indentification of rural poor,

(iii) what are their aspirations, needs and demands,

(iv) who assess the (iii) above and what are their competance and experience in the analysis of rural poverty,

(v) what are the value systems and life styles (one wants in relation to wants, needs and aspirations),

(vi) what is the national policy, goal and plan for eradication of rural poverty,

(vii) what do we mean by distributive justice of the proceeds of development with reference to rural poor,

(viii) what is the method of evaluations, and measurement of eliminations of poverty,

(ix) what constitutes successes and failures of a programme in rural development.

(x) how to assess the assessors, assess their basic qualification, competence of planners (than plan), assess the people, group, institution who implement, monitor or evaluate,

(xi) what are the gaps between individuals, groups, institution etc., engaged in rural development and the linkages between planning (at different levels) and implementation of the programme (organisation and management),

(xii) what technological tasks could be dovetailed to the national goals and plans,

(xiii) how to integrate people's competance, expertise resources and manpower and what comes in way of such "integration"

(xiv) how to generate the spirit of cooperation, team spirit among various agencies, groups, departments, and institutions to make them more effective and work in an integrated manner (by giving the implementing department some authority),

(xv) what 'education' is required for rural areas and rural development,

(xvi) what education can enrich the quality of life of the rural poor and help to make them self-confident and self-reliant,

(xvii) what could be the role of education and rural school and its teacher in the development of 'man' and how can it be knitted in the fabric of rural development programme,

(xviii) what are the viable 'non-crop growing' productive/economic programmes which may generate employment/additional wages and which are the competent institutions,

(xix) problems facilities, inputs, skills of technologies that could be determined for above (xviii),

(xx) how to assign these tasks to the competent people agencies and institutions,

(xxi) what is considered as an 'appropriate technology' in the context of eradication of poverty in rural areas, how can rural projects be made socially/viable,

(xxii) what is the national policy plan and goal for the above in relation to technological, fiscal, incentive, protection, regionalization, entrepreneurial tasks,

(xxiii) what are our programmes for landless labourers and those educated unemployed (landless) who want to stay in the village,

(xxiv) what should be the infrastructure for rural development if 'the development of a grassroots man' is taken into consideration; how to involve the rural poor in the development process,

(xxv) what should be role of NES blocks in the above context and in the 'Integrated Rural Development' programme of the Govt. of India; can it not be made wholly responsible to rural poor of the block area,

(xxvi) could the population of rural poor in a village be a viable unit for the implementation of programmes aimed at eliminating poverty, providing minimum aminities of life (safe drinking water, shelter, assured minimum wages) and welfare services (medical aid, education, recreation and mid-day meal to children),

(xxvii) what is the minimum economic unit of cultivable land for agriculture with reference to productivity (breakeven point of production) of food crops, economic plantation, spices, medicinal and aromatic plants, etc.

(xxviii) what could be done to enlist the active and effective participations of rural poor; what factors hamper their participation, and

(xxix) what do we mean by monitoring, evaluation and operations research with regard to rural development, what is our experience; who are the evaluators with what rural values, and experience.

These are just a few questions which require a positive direction, philosophy, and national policy with the progressive economic, social and psychological development in the

country. There is also the need for a continued vigilance and revision of philosophy of rural development. Till today, we have been mainly concentrating on agricultural development. True it forms the base, but what about the questions raised above.

This further draws, our attention towards the following issues in the context of eradications of rural poverty;

(i) agriculture (including animal husbandry) development is the only answer to above,

(ii) those who are responsible for above have little access to economic programmes other than agriculture,

(iii) those who are planning and implementing the programme are not aware of the significance of science and technology inputs (other than agriculture science),

(vi) the science and technology inputs have either an insignificant role to play, or they are not yet mature for introduction, or we want to keep our eyes shut in relation to this area for reasons best known to those at the helm of the affairs.

Unless there is a radical rethinking on the rural development programme aimed at the 'development of man (rural poor), and blending of ideas and experience of 'Gramsevak', we may not be able to solve the problem of rural poverty.

This percolates iessues like—

—the role of science and technology,

—the role of organisation, management and structure of achieving the objectives;

—agriculture must become an agri-industry and agri-business by maximising the returns, the utilization and recycling of the waste materials.

Management

When we talk that people are not educated we only mean that they don't have the means to earn their basic needs and not that they are ingorant. Integrated Rural Developmenti an inter-related approach of making good use of water, soil, crop, post-harvest technology and their managment. Other aspect is application of technology and making people (who are responsible for planning and implementation of the programme) aware of the significance of scientific and technological inputs (other than agriculture science). The later part requires consideration.

Further, there is the question of project concept and awareness, which actually relates to the cost of physical requirements (experts, tools, technology, extension), R&D, efforts (implementing department should have *full authority and acess to ensure* that the problems of rural poor and referred to and got resolved by *any istitution* private or public in India), vis-a-vis the benefits accruing to the rural people. Do we have this aspect in mind?

Transfer of Technology

Generating technology is one thing, but the success of transfer of technology to the prospective users depends upon how fully the technology is baked, how far the users (rural people in this case) are capable of adopting, absorbing and utilising the technology, how well the mechanism and means of transfer are good in choosing the proper channels of wave length, method of communication, dissemination and demonstration, and finally, the socio-economic climate around commitment and involvement of the government, their risk-taking ability, and sense of urgency. The question, therefore, arises as what are operational constraints in the transfer of technology to rural areas for a given purpose, situation, locality, availability of local resources of men and material.

Absorbing the Losses

'Seeing is believing', doing is convincing' and 'earning is confiding'. To inculcate self-confidence among the rural poor, we need not only to demonstrate the project successfully but also to take the responsibility of losses if any. The rural poor should be helped by promising that if there is profit in a project which they undertake they take the profit, while the losses if any are that of the implementing agency.

Can We Take This Decision ?

Human Factors :

While taking decisions we usually ignore human factors like professional jealousy, stealing the credits of someone, other personnel problems, name and fame etc.

What are the social lubricants we should use in such situation?

What should be the institutional behaviour, approach and imagination of the leader?

Do we give responsibility with vested authority?

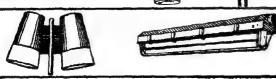
Who is vested with financial control and administrative control on 'CR'?

Interphasing and interaction a[re] very important. This requires build[ing] up of workable linkages. The[re] are successful stories of blending o[f] two or more institutions engaged i[n] rural development. How many o[f] these facilities we could manage t[o] get the job done.

Project Study

In view of above it is strongl[y] proposed that while Departmen[t] of Rural Development, Governmen[t] of India may go ahead with its IR[D] Programme, it should simultaneousl[y] set up a permanent study grou[p] consisting of economists, sociologist[s], operations research expert, scienti[sts] and the village level worker to wor[k] simultaneously on such aspects a[s] may strengthen the hands of thos[e] who are engaged in the vital projec[t] of IRD.

RECOMMENDATIONS

1. If such research is undertake[n] on the basis of socio-economi[c] development of recent past (fifth five year plan) it woul[d] certainly expose better infor[mation].
2. Such researches should be re[petitive] (at an interval of tw[o] years) to get an idea of develop[ment] and flow of knowledge temporary or lasting impact o[n] the people, which would form a food base for policy plannin[g] leading to better utilization o[f] R.D. efforts.
3. Training samples for differen[t] strata of people staying i[n] different climatic and ecological zones be prepared and studied with the aim of 'development of man'.
4. Action-research institutes (lik[e] the one in Uttar Pradesh) ma[y] be started in different geographical and ecological zones and the NICD should collaborate with these institutions and universities. NICD should als[o] sponsor research with funds t[o] competent people and institutions (including social voluntary organisation).
5. R.D. Min. should have a permanent (Research & Study) Group to study findings of such research for consideration o[f] action-research on pilot scale. Successful items should be recommended for extension in the related areas.
6. The intimate involvement of the users, beneficiaries and sample[s] of target group should b[e] encouraged in such researches.


Protein deficiency has acquired appalling proportions in recent years in the diet of our rural people. Fish can, therefore, become an important nutritional supplement to their diet. Besides providing nutrition, given scientific methods, fish farming can be an important source of income for rural institutions like Gram panchayats and village cooperatives as well as individuals.

Fish Farming—
Profit, Nutrition

MADHYA PRADESH IS particularly fortunate in inland water resources when comparted to some other states of the country. There are about 40,000 small tanks most of them in the south-eastern part of the State which can be easily used for fish farming. Given scientific methods, growing fish in them can be a very paying proposition.

Considerable research has been undertaken in the state to identify the most economic species of fish and to breed and rear them.

Selection of Tank

Proper selection of tank and its improvement is vital to fish farming. This is even more important while selecting a tank for the first time for the purpose. A tank admeasuring from one to three hectares and holding water about two metres deep is ideal. Its bunds should be in good repair and it should have a proper inlet and outlet for water. It should be easily accessible and fairly clean.

The tank bottom should be even and should not be either very rockey, miry of sandy. There should not be much acquatic weed as these impede fishing and might compete for food with fish.

Preparation

This is the season for preparing the selected tank for fish farming. The best thing to do is to dewater the tank and clear it of mud, vegetation, predators and insects which might harm fish. This would yield much unwanted fish which could be consumed or sold in local markets.

When the tank fills up it is ready to receive fingerlings. To enrich the water, cow-dung manure and chemical fertilizers may be dissolved in it 10 to 12 days prior to releasing fingerlings. The application of 3000 kg. of cow-dung manure per hectare scattered evenly over the water spread has been found to be ideal, 300 to 400 kg. of triple superphosphate and ammonium sulphate will further enrich the water. These fertilisers may be applied in more than one instalment. Cow—dung manure can also be applied by lowering it in bamboo baskets into the water and allowing it to dissolve slowly. This also obviates the risks of pollution. Application of manure and fertilisers help in the prolific growth of phyto and zoo-plankton upon which fish feed. A practical method of assessing whether there is enough food for fish is to lower one's hand into the water upto the elbow. If there is enough plankton the first will not be visible. Should it be visible it can be presumed that the water is poor in planktons. At this stage additionnal quantities of cow-dung compost can be slowly dissolved in water by placing it in bamboo baskets. If the quantity of plankton goes down considerably it may also be necessary to feed fish on artificial feed supplements like oil cake and rice bran in equal proportion. Such feed can be given by scattering it on the water surface. As such the quantity of plankton comes up to the proper level which can be judged by the simple hand test, artificial feed should be discontinued.

Stocking

A tank thus prepared for growing fish should always be stocked with good quality, fast growing fingerling. Although it is possible to grow only one variety of carp in a given tank it is more economical and profitable to grow three or four verieties of together, because different Varietes carps feed at different levels. Some feed at the bottom others feed at the top, some feed in columns and yet others feed on grass and other acquatic vegetations in the periphery. Catla, Rohu, Mirgal and the Common carp may be grown together. If the fish mix includes Catla, Rohu and Mirgal the proporation should be 4;3;3. Should common carp be added the combination can be put at 4:2;2:2.

Prior to the release of fingerlings the water in the tank should be thoroughly agitated which will help in decreating the surface water temperature. Fingerlings should then be lowered into the tank in a happa and after they are conditioned to the tank water for a while they may be allowed to escape into the water slowly. Alternatively, fingerlings can also be lowered into the water in buckets and allowed to escape slowly.

A careful watch should be maintained on the growth of fish, say once in a month, Predators like frogs, water fowl, rels, cat fish etc. should not be allowed to inhabit or frequent the tank. Should water level go down very low during the summer, the tank should either be filled from some external source or the fish should be extracted for consumption and sale. The tank bunds, the outlet and the growth of weeds should also be carefully watched with a view to repairing and controlling them.

To provide shelter to fish a section of the tank may be deepened a little the tank should be kept clear of weed so that fish may move freely in the water. Aquatic weeds should be removed manually from time to time and where this does not help even chemical eradication can be considered. For this the advice of the Fisheries Officer should always be sought. He should also be consulted for the prevention of aquatic insects and diseases affecting fish.

Netting

If due care is given, the fingerlings should grow to about three-quarters to a kilogram in weight in a year's time. These can be netted and sold. Marketing of fish should be planned in advance. before the actual netting operation. Netting requires the services of fishermen.☐

Yojana Quiz

1. Who was Ota Bapa?

2. Gandhiji's father called him 'Manu'. What did his mother call him?

3. On September 4, 1888, Gandhiji sailed for England by a steam ship. What was it's name?

3. "I am sitting on a man's neck, choking him, and demanding that he carry me, and without getting off him, I assure myself and others that I am very sorry for him and want to alleviate his condition by all possible means except by getting off his neck." Who said this?

5. What was Tolstoy Farm?

6. When and where was the most expensive lump o salt ever sold in India?

Answers :

Gandhi, was affectionately called Ota Bapa by the people. (2) Moniya (3) S.S. Clyde (4) Leo Tolstoy (5) Satyagraha campaign was then going on in Natal. There was a need for a place where the wives and children of imprisoned Satyagrahis could take refuge. Mr. Hermann Kallenbach bought a 1,100 acre farm at Lawley, twenty miles from Johannesburg, and gave it free of charge for the use of Satyagrahis. Gandhiji decided to call it Tolstoy Farm. (6) At Dandi on April 6, 1930 Gandhiji solemnly bent down, picked up a small lump of natural salt, and later on sold it through auction for Rs. 1600.

Evolution of Panchayati Raj

Panchayati Raj in India : A Study of Reforms at Centre and State Level since Independence *by S.K. Sharma; Trimurti Publications, New Delhi,* 1976; *Pages* 172; *Price Rs.* 30.

DEMOCRATIC decentralisation was adopted as a scheme to involve the willing participation of the people in the developmental process of nation-building activities. Panchayati raj was established with a great fanfare and in the initial years there was a great enthusiasm, sense of purpose, dynamism, official support and patronage but later the movement slowed down in effort and intensity. The book under review is an excellent account of the evolution of the system through commissions and committees set up at the Centre and State level since Independence. The study is a valuable contribution to the existing literature and fills a big gap.

Published as a part of Silver Jubilee Celebrations of Panchayats, the author has identified some of the weak points and deficiencies of the system. To bring out reports from the archives and to analyse them in a given framework is not an easy task. The study has shown that contrary to the popular belife, the realisation by the people of their own political power as also the knowledge about various processes of development have permeated to the lowest level. The system has widened the area of people's participation, autonomy and authority through the dispersion and devolution of power to popular organisations in all the triple dimensions of policy-making, financial control and administrative

management. On the other hand it cannot be ignored that every village is a divided house. The benefits of several of the programmes have only gone to a select few. The philosophy behind the setting up of *nyaya panchayats* has mostly failed to click. There is no budgetary freedom or autonomy and excessive state control kills the initiative. In terms of interest articulation, interest aggregation, local politics and national politics can be described as loose.

Whether studies are conducted or not, panchayati raj is going to stay and much of the tension between the various wings can be avoided by streamlining the structure. The Janata Government is committed to the people to implement the panchayati raj in the Gandhian spirit. This is a big challenge to the administrators and the academicians. Balwantrai Mehta devised the three-tier structure which deviated from Gandhian path. Should we put the clock back? Should we mend or end the present system? The last chapter of the book gives a way out when it is suggested that in the wake of the integrated rural development strategy, not a tear will be shed if the present system is uprooted. However, there is a long way to go yet. Ultimately the trust of the people is the basic postulate of these institutions and let that trust be strengthened by word and deed. A little care to fix a reasonable price would have increased the circulation but still no serious admirer of the system can afford not to buy the book. It is a commendable effort in presenting Panchayati raj in an analytical framework with scholastic vision and researchers depth.

—Y.C. Simhadri

Japanese Model of Planning

Development Planning : Lessons From Japanese Model *by V.S. Mahajan; Published by Minerva Associates Pvt. Ltd Calcutta,* 1976; *Pages X*+122

FOR THE crusade against poverty and unemployment in India, there can be no two opinions about the need for fresh approaches to planning and development.

A fervent plea is made in this book for the incorporation of the Japanese model into our development planning. The book is divided into three parts with twelve chapters. A historical analysis of the development of the Japanese economy—the functioning of the military rule, the role of the Government in creating a network of infrastructure facilities, growth maximising effect of agriculture and Japan's role in international commerce, has been painstakingly traced.

A study of Japanese economy brings to light the role of the State in development planning. The lessons to be "learnt" from the Japanese model is that the State should be careful regarding public sector programmes. According to the author, the State should undertake only such projects which reasources permit and also carry a rapid growth multiplying effect. Excessive involvement of the State in every economic activity, the author adds, would jeopardise their growth.

One gets the impression that the author has a soft corner for the private sector. The author envisages a greater role for the private sector, as is the case with Japan. He contends that it is the fear of nationalisation that encourages entrepreneurs to follow dubious business practices, thereby giving a clean chit to the private sector. Industrial atmosphere in India is, however, different. Here both the private and public sector have a role to play and should complement each other.

The author conveniently forgets that the Japanese miracle is over. The economic problem has reared its head again. Politicians in Tokyo, as in other capitals, are debating fiercely the familiar questions : how to maintain the economic growth rate, reconcile the competing demands of public welfare and public investment on limited resources and overcome the energy crisis.

Indeed there are as much lessons to be learnt as there are lessons to be "unlearnt" from the Japanese model enunciated in this book.

—R. Muralidhar

Pathways to Rural Prosperity

Eradication of Rural Poverty *by Shri Ramakrishna Vidyalaya, Coimbatore; Pages* 261; *Price Rs* 12.

THIS volume is a collection of speeches and papers presented at the Swami Vivekananda Centenary Commemoration National Seminar on Eradication of Rural Poverty which was held in November 1975 at Coimbatore by the Vidyalaya.

Rural development has shot to prominence in the last few months and is likely to receive greater emphasis in the policies and plans of the present government. In this context, the publication of this volume is quite timely and welcome. Particular mention may be made of the paper on the 'Role of Agriculture and Agro, Khadi and other industries which gives a good idea of the magnitude of existing and future unemployment in rural areas The paper also indicates the employment potentialities of such programmes as improved agricultural pratices, expansion of irrigation, multiple cropping, dry farming and that of other rural activities like animal husbandry, dairying, village and small scale industries. The paper holds out the promise of elimination of rural unemployment by the end of this century. Experiments in providing employment in villages is another paper which throws light on the various efforts so far made for combating rural unemployment. It refers to some interesting experiments being made in certain States like Kerala and Karnataka where organisational innovations have been attempted to tackle unemployment on a self-financing basis. The results of such experiments can be particularly helpful in extending these practices beyond the limited confines of one or two States.

There are some useful papers on water management and agricultural occupations such as dairying, poultry, sericulture, sheep rearing is the theme of another paper. The papers pertaining to financing of rural activities show the size and pattern of credit flowing from various financial institutions to the rural sector and also the extent of availability of credit to different types of rural economic activity, to the weaker sections and to the backward areas of the country. Other papers naturally emphasise the need for social infrastructural facilities like expansion and re-orientation of education and training facilities, role of education/technical institutions therein; more rural roads, better water supply and health care.

A really useful section containing recommendations of the Seminar is given at the end. Though there is no denying the high utility of this volume even as it is, its utility could have been enhanced by including papers on topics like impact of land reforms, scope for placing rural development on self-financing basis. One or two case studies of rural development in the country would also have been welcome

—G.S.

CALCUTTA SLUMS

Calcutta has been often described as a city of slums. Not much attempt has, however, been made to understand the circumstance which led to the growth of these slums in this city.

The bustees (slums) of Calcutta are not just residential settlements. In fact, they are as old as the city itself. They grew with the city and increased in number as Calcutta become the centre of industrial activity. Over the years, much of the industry and employment in the unorganised or informal sector ranging from small engineering to footwear, woodcraft to garment making or plastic ware, came to be located in these bustees. Out of the city's total manufacturing employment of about 830,000 a little over half is accounted for in the informal sector.

The slums are not, as many think, squatter settlements, they are governed by regular tenancy system. As industries grew, marginal land was purchased by landlords and given to middlemen (thika tenants) on rent. These middlemen constructed slum houses which were let out and sublet to poor industrial workers.

Till 1969 no conscious effort was made to help the slum dwellers except meagre steps to rehouse them. It may also be mentioned that the last slum was improved in 1946 and Mahatma Gandhi lived in Beleghata for a few days.

In 1970, when the Calcutta Metropolitan Development Authority was set up one of its primary task was to improve the environmental hygiene of the metropolitan area. Since the number of slum dwellers in the metropolitan area, was over 20 lakh out of a total population of nearly 90 lakh, the attention of the CMDA was focussed on the slum problem. By that time, there were over 3,000 registered slums in the metropolitan area.

After the pilot and sociological surveys, it was decided that the physical removal of the slums and the slum dwellers was an impossible task. It was assessed that the number of per-capita cost of rehousing would be over Rs. 5,000. This would mean investing an astronomical sum of 1000 crore rupees for the purpose.

It was, therefore, decided that a programme of slum improvement as opposed to slum rehousing should be launched Under this programme, all the registered slums are being improved with the provision of drinking water, paved roads, electricity and sanitary latrines. The cost per capita varying between Rs. 120-150.

So far about Rs. 18 crore have been spent by the CMDA to provide the above mentioned facilities to over 1500 slums covering a population of over 12 lakh. Apart from the programme for improvement of slums, the CMDA has also taken up, at an experimental level, schemes for slum redevelopment and provision of sites and services in certain locations.

The programme will be continued till the remaining 1500 registered slums are improved.

— A.K. Matilal

Development Notes

Tansi Watch Unit

The work on the watch assembly unit being set up by the Tamil Nadu Small Industries Corporation (TANSI) in collaboration with Hindustan Machine Tools, Bangalore, is making good progress.

The Rs. 27 lakh project is being set up in Ooty in the Nilgiris district and is likely to go into production by the end of this year.

The capacity of the plant during the first year of operation will be 1.5 lakh numbers which will be stepped up to the full capacity of 2.5 lakh numbers per annum in the subsequent year.

The HMT will be supplying components for the watches and will take back the assembled watches for marketing by them. The annual turnover is expected to be around Rs. 15 lakh.

Under the agreement, HMT will give assistance in the supply of technical documents, training, lists of equipments, jigs, fixtures and tools and also in the procurement and installation of equipment. The TANSI project when in full operation is expected to give employment opportunities to about 100 workers. It had been proposed to employ mostly women as the job required dexterity in the hands of the operators.

Giant Fertiliser Plants Planned

Two giant fertiliser projects, involving a total outlay of nearly Rs. 450 crore, are being set up in south Bombay at Rewas to make use of the natural gas that will flow from the Bombay High oilfields. A decision by the Government on the two projects, which will have a total production capacity of 2,700 tonnes of ammonia per day. is expected soon.

The creation of such a massive fertiliser capacity, will go a long way in bridging the wide gap between availability and demand for chemical fertiliser. To meet the growing fertiliser requirement, the country had been spending around Rs. 450 crore on imports. Though lately the foreign exchange burden on account of fertiliser imports has been somewhat lower, primarily because of the sharp decline in the prices of fertiliser in the international market, there will continue to be sizable foreign exchange outgo for the import of fertilisers.

The technology in this regard is not likely to pose any major hurdle as a large number of units with 1,350 tonnes capacity are already operating in different countries.

Moreover, the location of the two plants adjacent to each other will provide a lot of additional benefits.

New Power Plants for Gujarat

The Gujarat Electricity Board plans to create additional generating capacity of 1,320 mw during the next five years, by setting up some new units and by expanding some of the sanctioned units. The new capacity planned will be over and above the latest sanctioned 600 mw Janakbari thermal power station.

With the completion of above projects, Gujarat will have two giant-size power complex of 1150 mw at Ukai and 1200 mw at Vanakbori. Practically these will be super thermal stations. The total installed power generating capacity which was 1142 mw by the end of the Fourth Plan, now stands at 1922 mw. As a result of the expansion programmes on hand, the total generating capacity will go up to 2432 mw by the end of the fifth plan and at that stage it will be just matching the demand.

NSC Hybrids for Denmark

For the first time export of hybrid varieties of seeds is being undertaken. The National Seeds Corporation has entered into a long-term agreement with a leading Western seed distribution organisation of Denmark for marketing abroad.

In the field of quality vegetable seeds production the NSC's efforts cover grooming progressive culivators in their production and helping them in handling proficiently export orders.

Over six lakh hectares have been covered under improved hybrid varieties of seeds for major kharif crops such as sorghum, bajra and maize Improved quality of seeds for these crops were made available to the farmers by the NSC.

The expected yields of hybrid crops covered by NSC seeds are estimated to be over 14 lakh tonnes. The production of these quality seeds was organised by NSC in different states where agro-climatic conditions favoured their production.

NSC has achieved a major break-through in jute seed production in areas which are not traditionally jute growing. The maximum consumption of jute seeds is in the eastern sector. But the highest quality seeds of jute are produced in the western sector especially Maharashtra.

ARDC Disburses Rs. 17.10 cr. in Bihar

The Agricultural Refinance and Development Corporation's disbursement in Bihar during the year ended June 30, 1977 was Rs. 17.10 crore. Aggregate disbursement in the state since the inception of corporation totals Rs. 49.59 crore.

Taking the country as a whole, the disbursement during the year ended June 30 this year was of the order of Rs. 221 crore, when the aggregate disbursement since its inception was Rs. 815 crore.

The funds advanced through the state Land Development Bank and other commercial banks covered 36 schemes in 1975-76 and 100 schemes in 1976-77 in Bihar. So far 194 schemes have been financed by ARDC funds in the state.

In regard to the extent of funds disbursed, Bihar ranked tenth among the states. Uttar Pradesh led with Rs. 120 crore covering as many as 625 schemes.

In order to reduce the regional imbalances the ARDC has categorised as less developed or under banked the states of Jammu and Kashmir, Himachal Pradesh, and Rajasthan in the northern region and all the states in the central, eastern and north eastern regions. The International Development Authority (IDA) has approved a two-year programme for the ARDC.

Handloom Exports

India's export of handloom products during 1976-77 has been provisionally placed at Rs 215 crore as compared to the estimated figure of Rs 185.49 crore in 1975-76. The items which were mainly exported included fabrics, made-ups and ready-made garments particularly bleeding Madras, real Madras handkerchiefs, floor coverings, bed covers and bedspreads, towels and napkins Besides cotton handloom items, silk and woollen handloom products also contributed to export hike.

Countrywise, the main importers were USA (Rs 3547 crore), UK (Rs 2448 crore), West Germany (Rs 2164 crore), Netherlands (Rs 64.5 crore), France (Rs 5.79 crore), Dahomey (Rs 5.24 crore) Italy (Rs 3 81 crore) Canada (Rs 3.19 crore), Sweden (Rs 2.94 crore), Australia (Rs 2.65 crore), Switzerland (Rs 2.38 crore), Japan (Rs 1.79 crore), Denmark (Rs 1.49 crore) and Saudi Arabia (Rs 1.21 crore).

Substantial Rise in Export of Plastics

India's export trade in plastics and linoleums registered substantial rise at Rs 260.37 million in 1976-77 compared to Rs 180.89 million in the previous year. The contribution of plastic items was Rs 241 million against Rs 160 million in the earlier year. The exports of plastic moulded and extruded goods have touched the figures of Rs 60 million in contrast to about Rs 36 million, having crossed twice over the target set at Rs 30 million for the year. The exports of PVC rigid pipes and conduits have more than trebled over the performance of 1975-76 which was Rs 14.5 million and approximated Rs 52 million in the subsequent year.

Railway Earnings Up

The Railway earnings increased by about Rs 30 crore during the quarter April-June 1977 as compared to the same period last year, both by way of effecting economies and carrying of additional passengers and cargo. During these three months the three production units of the railways—the Diesel Locomotive Works, Lucknow, the Chitaranjan Locomotive Works and the Integral Coach Factory, Madras have improved their production by 36 per cent.

The Diesel Locomotive Works produced 32 diesel locos as compared to 21 for the same period last year and the Chittaranjan Locomotive Works produced 22 electric locos as compared to 15 in 1976 while the Integral Coach Factory built 134 coaches from April-June 1977 in contrast to 130 in the three months in 1976 The Railways are hopeful of exceeding the fifth plan target of carrying 250 million tonnes of freight traffic by 1978-79

ADVICE TO LABOUR

The secret that we have hit upon is that when capital wants labour to say, "Yes", labour roars out "No", if it means, "No". And immediately labour comes to recognise that it has the choice before it of saying "Yes", when it wants to say "Yes", and "No", when it wants to say "No", labour is free of capital and capital has to woo labour And it would not matter in the slightest degree that capital has guns and even poison gas at its disposal Capital would still be perfectly helpless if labour would assert its dignity by making good its "No" Then, labour does not need to retaliate, but labour stands defiant receiving the bullets and poison gas and still insists upon its "No" The whole reason why labour so often fails is that, instead of sterilising capital as I have suggested, labour (I am speaking as a labourer myself) wants to seize capital and become capitalist itself in the worst sense of the term. . No man could be actively non-violent and not rise against social injustice, no matter where it occurred If man will only realise that it is unmanly to obey laws that are unjust, no man's tyranny will enslave him This is the key to self-rule or home rule We cease to cooperate with our rulers, when they displease us . It was direct action in Champaran which removed an age-long grievance. A meek submission, when one is chafing under a disability or a grievance which one would gladly see removed, not only does not make

On March 12, 1930, Gandhi set out from Sabarmati with 78 followers on his famous Dandi march He covered the 241-mile distance in 24 days, addressing huge gatherings on the way On April 6, 1930 he broke the salt law,

for unity, but makes the weak party acid, angry and prepares him for an opportunity to explode By allying myself with the weak party, by teaching him direct, firm, but harmless action, I make him feel strong and capable of defying the physical might. . . . He feels braced for the struggle, regains confidence in himself and knowing that the remedy lies with himself, ceases to harbour the spirit of revenge and learns to be satisfied with a redress of the wrong he is seeking to remedy . . . Whilst a *satyagrahi* never yields to panic or hesitancy, neither does he think of humiliating the other party, of reducing it to abject surrender He may not swerve from the path of justice and may not dictate impossible terms. He may not pitch his demands too high, neither may he pitch them too low.

– *MAHATMA GANDHI*

Regd. No. D(D)-15

FROM TRUTH TO TRUTH

The life of the millions is my politics, from which I dare not free myself without denying my life work and God That my politics may take a different turn (after August 15, 1947) is quite possible. But that will be determined by circumstances I have said that a man who wants to be good and do good in all circumstances must not hold power.. . The poor sisters of Orissa have no *saris;* they are in rags. But they have not lost all sense of decency, but I assure you we have. We are naked in spite of our clothing, and they are clothed in spite of nakedness It is because of this that I wander from place to place, I humour my people, I humour my American friends... .. My strength lies in my asking people to do nothing that I have not tried repeatedly in my own life.... The voice within tells me, "You have to stand against the whole world although you have to stand alone. You have to stare in the face the whole world although the world may look at you with blood-shot eyes Do not fear. Trust the little voice residing within your heart It says: "Forget friends, wife and all but testify to that for which you have lived and for which you have to die"......If Gandhism is another name for sectarianism, it deserves to be destroyed. If I were to know, after my death, that what I stood for had degenerated into sectarianism, I should be deeply pained. ... My aim is not to be consistent with my previous statements on a given question, but to be consistent with truth as it may present itself to me at a given moment. The result has been that I have grown from truth to truth .... What I have done will endure, not what I have said or written...... After I am gone no single person will be able completely to represent me But a little bit of me will live in many of you If each puts the cause first and himself last, the vacuum will, to a large extent, be filled .. Fearlessness is the first requisite of spirituality. Cowards can never be moral.. ... Where there is fear, there is no religion

—Mahatma Gandhi

Uncanny Prescience

Less than ten days before his martyrdom, Mahatma Gandhi said .

"If I die of a lingering illness, nay even by as much as a boil or a pimple, it will be your duty to proclaim to the world, even at the risk of making people angry with you, that I was not the man of God that I claimed to be. If you do that, it will give my spirit peace. Note down this also that if someone were to end my life by putting a bullet through me, as someone tried to do with a bomb the other day, and I met his bullet without a groan, and breathed my last taking God's name, then alone would I have made good my claim "

SCHUMACHER IS DEAD

Small is Beautiful

"The importance of technological choice is gradually entering the consciousness of economists and development planners. There are four stages. The first stage has been laughter and scornful rejection of anyone who talked about this. The second stage has now been reached and people give lip service to it, but no action follows and the drift continues. The third stage would be active work in the mobilisation of the knowledge of this technological choice ; and the fourth stage will then be the practical application. It is a long road, but I do not wish to hide the fact that there are political possibilities of going straight to the fourth stage. If there is a political ideology that sees development as being about people, then one can immediately employ the ingenuity of hundreds of millions of people and go straight to the fourth stage. There are indeed some countries which are going straight to the fourth stage . . .

"The virtues of a massive public works programme for job creation have often been extolled . . .

"Only one must not be blocked by being too damn clever about it. We are always having all sorts of clever ideas about optimising something before it even exists. I think the stupid man who says 'something is better than nothing' is much more intelligent than the clever chap who will not touch anything unless it is optimal . . .

"I should like to remind you that the Taj Mahal was built without electricity, cement and steel and that all the cathedrals of Europe were built without them. . . It is a fixation in the mind, that unless you can have the latest you can't do anything at all, and this is the thing that has to be overcome."

ONE STEP TO DESPAIR

The Wit of Schumacher

BEING MISUNDERSTOOD

People always think I want to take their technological toys away. I have no such intention. I was talking in Germany and had an audience, and after my talk I walked out. Behind me was an enraged couple and the woman said, "What stupid stuff this guy was talking! Do you know he arrived by airplane? How could he come by airplane if we only had intermediate technology?" Well this was too much for me, and with the utmost politeness I turned around and said "Madam, in that case there would have been no need for me to come."

SHOEMAKERS

I can speak from authority on the subject of making technology fit because my name is that of a shoemaker. It is not good enough to make excellent shoes. It is necessary that the shoes fit. It is not good enough to make them bigger and bigger. One has to consider the needs of the little people and that we have totally forgotten.

The task is not to abolish the big steel works. They will abolish themselves. The dinosaurs collapsed under their own weight. The task is to fill the middle area of technology so that we have shoes for every size of foot.

COMMUNIST COUNTRIES

This fascination with things — the bigger the better — has little to do with communism and capitalism. It is a universal trait of all civilisation. Not so long ago I was in East Germany and they were giving a very pungent description of what they thought about Western economics, and at one point, one of them said: "The Western economics are like an express train moving at an ever-increasing speed straight into an abyss. But we shall overtake them."

BIG CITIES

Ninety-eight per cent of the United States' total area is inhabited by eight per cent of the population. That is an extraordinary thing, but not at all confined to the U.S. It is everywhere the same. Thus in the over-industrialised countries like Britain and the United States, big problems can only be solved in the rural areas.

In an overgrown thing like London, Tokyo or New York you can ameliorate things. But they are monstrosities and cannot survive. So what must people do to get out of it? There is enough room. So we need to develop the small town and they cannot develop unless there is appropriate technology.

WORKING WITH YOUR HANDS

People ask me how we got into such a technological predicament. I put a lot down to the snobbishness of our education — a special kind of snobbishness namely — to work with the brain is more worthy than to work with our hands. St. Thomas Aquinas said "The human being is a being of brain and hands." [illegible] and we cultivate a [illegible] don't keep in touch with reality. It comes when you don't work with your hands anymore that you don't have to think small and [illegible] your brain run wild.

THINKING SMALL AT HOME

My passion has always been for more at home self-sufficient production. I grow practically all the food for the family. We're vegetarians now, and that was a big change in life style. It's a pretty large household and I [illegible] not my wife mill the flour and bake the bread.

ECONOMISTS

They haven't a clue about the truth and therefore the world goes on while economists make the [illegible] street organ music which has nothing to do with what's going on.

TOPSY-TURVY OF EAST AND WEST

The whole pattern is kaput. The West lives its error and the East sleeps over its truths. Everything has become topsy-turvy. California has orientalised itself. Japan has westernised itself. There are more Zen Buddhists in California and more out-and-out materialists in Japan.

METAPHYSICAL CONFUSION

The real social disease today is a metaphysical confusion. The materialists spread the myth that there are eternal mysteries and nobody can find the answers. That's absolute rubbish. If you have been thoughtful you can't fall for claptrap like saying "We must have growth." Growth is a purely quantitative term and you can't [illegible] growth is good or bad.

HIGH PRICED CAPITAL

Technology has become so [illegible] that most of us are ex[illegible] Henry Ford started some [illegible] [illegible] capital [illegible] [illegible] the amount of [illegible] [illegible]

MODERN TECHNOLOGY

Things have become so big, complicated, so costly and so [illegible] that it's only the biggest and strongest that can carry the technology and hence so much of business is made by multinational corporations. And it's no use complaining about multinational corporations and at the same time [illegible] that we are developing technology that only multinational corporations are big enough and rich enough [illegible]

SCIENCE AND RELIGION

The scientists' zero is at lowest possible level and all they see is the outward appearance. [illegible] thinkers have taken the time [illegible] to learn from the latest scientific discoveries but from the tradition[illegible] wisdom of mankind.

One Step to Despair

THE SIGNIFICANCE of the warning uttered by . Shri Morarji Desai about the disastrous consequenc short run, of the failure of the Janata Party is very like missed in the wilderness that is India's present day politic

There may be some merit in the statement that the pa instrument of performance, not a showpiece of unity. Di may not be such a bad thing but the trouble in Indian argument is that the issues debated upon often are of li sequence to the mass of the people.

It has been a fashion for long years now for political to assume postures of one kind or the other. Very few can say with sincerity that they themselves are either or clear about how one can change "this sorry scheme c entire".

Whatever be the performance of the government, organisational wing of the Janata party claim that it fashioned into an instrument of performance ? Quite ap the fact that the democratic forums of a national party nowhere round the corner and that decisions and discussi all the marks of an earlier discredited system of coterie the party's failure to turn to good and ethical purpose surge of people's enthusiasm is a tragedy of the first ma If anything has been done to convert the unbounded ene the common people into an avalanche of a crusading b a new social order, it has been obviously kept a closely-secret. A nation, after renewing its commitment to a byg represented by a phenomenon called Gandhi, is now stup a great betrayal of faith. Its noble people move about in condition, bewildered, rudderless, disenchanted and not y pletely desperate. But that is only one step away.

Nobody need be greatly worried about the future of o or the other. Not many tears need be shed if one party way of another. What, however, should and does cause and unease among a broad spectrum of honest public o an anguish reflected in JP's warning—is that the choice the country shows every sign of becoming one betwee and Charybdis, between disaster and calamity.

The polemics of the leading lights of political part the people by like "an idle wind" which they "respe These leaders can argue to their heart's delight and cry till the cows come home.

THE PEOPLE's real dilemma is: where do we g here ? With sections of the opposition marching f opportunism to the next, with their star performers growin untruth to untruth", with the "mafia" summoning up courage to defy, challenge and demonstrate, with the Jana afraid to strike and unwilling to act the setting is ide great degeneration of public life flowing from a general despair.

Add to this the combined left refusing to be releva unregenerate civil service and professional class clinging notions, petty self-interest, pointification and clamour fo and privilege, a working class without a social commit trade union leadership of infinite irresponsibility and a

Is anyone in this country—in the political parties, among the middle and working classes, in business and industry—losing any sleep over this state of affairs?

This is the question implied in JP's and Shri Desai's warning. The splintered opposition, for all its new found love of the meek and the down-trodden, is a grand hypocrisy where it is not a huge joke. The avenging angel, for all the talk of an ancestor's vision, remains, as always, a fraud and a mountebank. It is in this context that there is a general unease about the drift of the party in power. What does the morrow have in store?

FOR THIRTY years, this country was cheated of its rights and the people of their sovereignty The days of March roused hopes of a new, challenging and exciting world. What has the triumphant party done to sustain these hopes and lead this nation from one adventure to the next adventure? On the other hand, have not the innocent people been led from disenchantment to disillusionment and from disillusionment to stupefaction?

It is not a single act of omission or commission It is not merely that someone is less of a statesman than of a bureaucrat, another has little to show for his sincerity save his innocence or a third wishes to appear to be brave without the basic quality of intellectual and moral discipline. It is not the procession of people going abroad at the drop of the hat leaving an arduous task pending and petrified. It is not the indecision about industrial policy and confusion over multi-nationals, nor the inability to evolve a national consensus on a worthwhile education policy or on overcoming a continuing social inequity. It is not the lethargy in evolving a meaningful policy of austerity. of a halt to this mad competition in urban pampering, of a rational low incomes, low wages, low profits and low prices policy based on a revival of the spirit of the Gandhi era, the spirit of service and sacrifice. Nor is it the funny business of peripathetic men making one pronouncement of intent to be followed by a counsel of patience.

All this may add up to a terrible indictment One can go on and on. Where is this rural industrialisation and when are we starting on this road to the promised land? What exactly are the plans to provide drinking water to all the villages? Where is the sign of the massive scheme of water management? When are we going to use our food reserves as the basis of a wage system in the short run for millions of people to be employed on worthwhile schemes? When is one going to look at the state of our hospitals? When is one going to end the ostentation and tyranny of an administrative system unsuited even to a colonial regime? How are we going to enthuse our doctors, engineers, educationists and the rest to build a new nation without getting involved in a silly stampede for post and positions and emoluments? What is our schooling system for the villages and why can we not establish a hundred thousand schools in six months' time? Are there not men and women of dedication, talent and purpose in this country? Where is the scheme to involve them in an enterprise of endless possibilities?

Is there any evidence anywhere of any group of people—in government, political structure or the professional system—meeting, discussing, planning and acting? Is there a sense of confidence in the country that somewhere, someone is involved in the serious business of leading this country forward into ever-widening thought and action?

TO REPEAT, the various components of action and inaction add up to terrible indictment. Neither time and circumstance nor the lack of it can answer this indictment. But the bigger accusation is that in less than no time, the people have been reckoned without. They do no longer seem to be a decisive commodity in the politics of this land. They have been taken for a ride and, what is worse, they are being taken for granted. The operators seem to have taken over. There is a creeping, uneasy feeling that Indian political development is again becoming an exercise in management and administration What seems to be forgotten is that democracy and development are something more than governance, efficiency or inept, honest or deceitful, humble or arrogant These are essentially political processes to be founded on people's involvement in the tasks of building a new nation from the debris of shattered hopes and aspirations

The millenium may not arrive yet. But endeavour, great endeavour, should be here and now. It is the prospect of involving the people, enabling them to move from an upsurge of hope to an upheaval of anticipation and then to a mass movement of meaningful democracy anchored to human beings and not to soulless institutions—it is this which invested the March election with a strange glow Was the significance of this mandate too big for the maundering politicians to grasp?

The days of March were followed by the anxious days of April and then came the great gathering in the Hall of Nations In the manner of that momentous congregation and in the choice of the new leadership was seen a new loyalty to the exuberance of youth, to humility of dedication and to the fervour of intellectual integrity And India seemed to be turning away from the era of cabalistic politics and returning to the almost forgotten era of people's politics.

IT IS THE shattering of this hope and expectation that makes the national scene so dreary and desolate Men who swear by Lohia seem to have forgotten the doctor's mission and purpose. Others seem to have travelled far from the idealism of their involvement in the JP movement, in the struggle against a treasonable emergency and in the shared glory of sacrifice. The heirs to the Congress of an earlier period seem to have forsaken their faith in mass action.

What is the remedy? The "pseudo" idealogues of the right and the left are unlikely to be of great help The party functionaries and the so-called representatives of the people cannot be weaned away from the time honoured game of ante-room, backstage intrigue, appeals from the national leadership notwithstanding

THIS IS WHERE Mahatma Gandhi comes in The secret of his magic lay in transforming overnight the national scene of despair into an excitement of striving by giving the people themselves an opportunity to act Thousands of social workers were involved in fighting social evils of one kind or another in the process receiving lathi blows as much from the police as from the goondas Thousands of others young and old, were equally involved in different forms of constructive endeavour And finally, Gandhi gave us this great weapon of non-cooperation. Even in rags and supposed bondage, the people lived in an exciting world of adventure

This is the path for the broad spectrum of honest and dedicated political cadres in this country, what ever their party or ideology. Let the motley crowd of politicians indulge their treasons, stratagems and spoils. Let the decadent bureacuracy and sermonising intelligentsia experiment with their pet exercises of

industrialists develop their machinations of blackmail, bribe and threat. Let the trade unionists feather their nests with their brave battles for bonus and dearness allowance. Let "the mealy-mouthed, leathery-faced, high-binding, hornswoggling" political adventurers continue with the skulduggery of lobbying for multinationals behind the facade of patriotic self-reliance.

There is yet a wide field of action. Let us not adopt any posture of self-righteousness, of a Savanorala rebuking the sins of the people. The time, circumstance and the place are here with us to launch a mass movement of non cooperation with social iniquity, political cant, intellectual dishonesty, moral indifference, business hypocrisy, trade union tyranny and elite privilege—in short a movement of, for and by the masses of deprived people. In this movement there is a place for Gandhians, a cross section of class and the non-conformist intelligentsia. This i the way of fighting for the down-trodden, harijans a well as others, this is the way of fighting for a nev social order. Let all men unite for unleasing thi mass movement—a process of millions on the move.

IT IS SUCH a movement, not mere expectation from the rulers nor exercises in social philo sophy, that will dispel the gloom. This is the tim to unite on a broad national platform of compellin action. Out of this will emerge the time to split o the basis of ideology. But when that time comes, th people will already have built enough strength t face every danger to their polity, their heritage an their sovereignty.

This is the time to act. Tomorrow may be to late.

The Two Hundred Days that Did Not Shake the World

"TEN days that shook the world". That was an apt description of how Lenin went about the task of transforming the national mood.

Tagore wrote. "They (the Soviet leadership) have no time to lose, because the whole world is their opponent, they have to prove without delay that what they want is not wrong, and that it is no fraud"

Nehru wrote "They had time, even on the fourth day of the Revolution, with firing going on in the streets, to establish the eight-hour day for the workers and formulate their policy for a system of popular education".

It was not merely the speed but the content of the new order which thrilled Tagore. He said: "What has pleased me most here is the complete disappearance of the vulgar conceit of wealth For this reason alone, the self-respect of the people has been restored, peasants and workers have all shaken off the load of disrespect and raised their head How wonderfully easy has become man's relations with his fellows!"

Tagore wrote more than ten years after the Soviet Revolution He said, "If I had not seen with my own eyes, I could never have believed that, even within ten years' time, lakhs of people, sunk in ignorance and humiliation, could not only be made literate but given the dignity of manhood".

In the context of the history of those times, the poet said, "A decade or two is determined to prevail against a millenium".

It would be much less than charitable to expect that the new government in India would accomplish the task of prevailing against a millenium in just six months. Criticism on this count is plain malice.

A FURTHER factor which goes very much in Shri Desai's favour is that, though the March transformation was unique in the context in which that transformation took place, there is no parallel between a revolution which swept away an existing legality and a mandate within a prevailing system Neither the structure of social relationships, political institutions and administrative hierarchies nor the premise upon which our constitutional polity is based was disturbed by the electoral process.

"This is a limiting factor. The situation in 1947 was different but the tragedy then was that with freedom came partition, the great exodus, the Kashmir war and the states problem. These were built into the structure of the independence scheme. Partition itself was hastily conceived and the resultant chaos could not be averted. In the event, the energies of the leadership were concentrated on creating some order. The crisis brought out the best in India's services, civil and military and the bureaucratic idea flourished at the cost of the political idea The swing to stability brought with it the swing to conservatism, the handmaid of consolidation.

Here was the incipient attack on Gandhi, though perhaps fortuitous and motiveless. The mass idea was giving way to the elite idea.

One might well ask why a man, charmed by Lenin's resolve amidst an even greater crisis to fulfil the goals of the Revolution, should have done less. The answer probably, is that Nehru, unlike Gandhi or Lenin, had no political philosophy of his own. There was no relationship between whatever ideas he had and the institutions he created. Each one of his ideas—political democracy, economic planning, secularism independent foreign policy, social transformation—stood apart. They did not flow from a single formulation.

THUS THE CONSTITUENT Assembly was a body dominated by experts. The Constitution itself was an exercise in grandeur; the formalisation of the people's rights was eminently the projection of the urban liberal concept. The periphery of the people's idea flourished and the core languished. Parliamentary democracy was shackled by institutionalism. Planning, secularism, minority rights, social reform education—everything was reduced to form at the cost of the substance and became a playground of bureaucrats, not the crucible of ideas.

If one ripped Nehru's state of its facade and the constitution of its mask of high purpose, one would see them to be essentially anti-people. The Constitution was a perfect document for a perfect law and order state, for a polity of "management". It was a paradise for the decadent urban class, with a pro-

iis class. The vote did not redeem the people be-ause it was subject to the inviolate form of State ructure which ensured that the people were not overeign even in name.

The first Republic (is it not time for a second Re-ublic?) was not a noble design for a decade or two r even three to "prevail against a millenium".

The events of March made no difference to this yrannical legality. To this extent there could be ome excuse for the apparent helplessness of the new overnment. But the manifesto of the Janata Party, ot a very revolutionary document perhaps, at least eld out hopes of a radical new thrust and direction o our polity. Two tasks were promised—one to re-rganise our political, economic, social and cultural tructure on the Gandhian model and the second, uickly to undertake certain enterprises of great "pith nd moment" even without waiting for this reorgani-ation.

Two hundred days cannot prevail against three de-ades, let alone a millenium. But they were sufficient o start the long march towards the new order. If en days could shake the world, two hundred days ould at least have saved the people from a near total isenchantment. On the other hand, one increasingly ets the uneasy feeling that the structure of the State, e styles of administration and the tyranny of system night get further strengthened. If Lenin was in a urry because of an international conspiracy, Shri Desai has to be as much in a hurry because of an ncipient national conspiracy. Tragically he does not ppear to realise that time is very likely to be against im.

THE REBEL in India, it would seem, on his accession to power, dramatically changes his ttitudes to the symbols and forms of the estab-shment. What was blasphemy, overnight, becomes e gospel.

If the grandeur and nobility of the era symbolised y the toothless friar vanished in next to no time when his "political heir" found new virtues in the egacy of the British establishment, the fervour for lemental change which, we were led to expect, was ound the corner after the second "revolution" in March 1977, seems to have disappeared even faster han in August 1947. Ministers moved into bungalows, ournalists came into their own not as tribunes of the eople but as peddlers of influence and recipients of atronage, the civil servants (are they servants or nasters?) blossomed from servility to arrogance, the usinessmen (called by a rebel-turned-Minister as rats") were happy that once again business was as sual, the trade unionists, cowardly in crisis, resumed heir pastime of lunch-hour and street corner "in-uilabs", and the professors, emerging from the sanc-uary of acquiescence, began telling one and all where hings went wrong.

WHAT IS IT that causes such wild despair all round today? Why are men desolate? Whence s the gloom? Is it prices? Is it crime? Is it the ontinuing assault on the self-respect of men whom Gandhi called "Sons of God"? Is it the repeated nstances of police firing at the first provocation?

These may have contributed their share to the gene-ral mood of helplessness which has gripped the coun-ry. But a more basic explanation is to be found in the fact that the new dispensation has given little evi-dence of any great eagerness to do away with any or all of what the old dispensation symbolised in the

ministration and governance remain. The lobbies and operators are either doing roaring business or at least give the appearance of doing so. Decisions are taken and handed down without anyone knowing the why and how of them. Projects continue to be ceremonious-ly inaugurated. Ministers go abroad to deliver a series of lectures keeping the serious and arduous business of government pending. There is a competition to be seen in the company of "progressives" or "saints". Image-building is again good business having enough patrons. And men who braved and stood the ground are no longer wanted; and as in Jawaharlal's days the "solid" and "dependent" "steel frame" is preferred to a whole generation of men "tried in the furnace". The criminal accomplices of another era "manage" to stay on with a good word from one important person or another more important person.

There is leisureliness in high places, unworthy cau-tion, much bombast and less humility. Will all this be reversed? There is no sign of this. The battles within the ruling party or the main opposition are not based on any ethos or idea. There is jockeying and bargaining, there is no real adventure or excitement of intellectual challenge and response.

THERE IS GENERAL loss of faith. Basically, this stems from insufficient understanding, by everyone who is some one in politics, of the nature and dimen-sion of the transformation which took place in March. This was no ordinary election. It was not only party which won, nor another person who was thrown out. It was a unique demonstration, in many ways reminis-cent of the advent of the Gandhi era, of the nobility of a people roused from three decades of torpor by the trauma of nineteen months. And that nobility, which burgeoned into a swelling opinion against ini-quity, contumely and paternalism of a decaying politi-cal system, like an avalanche, swept the tinsels before it.

What remains now to remind us of that national re-surgence? Very little indeed! A people in noble rage threw off a chafing yoke only to find themselves again shackled by the very system of governance which they rebelled against. Their energies spent in battle, they now are dazed by the swiftness of a perfidy far worse than this country witnessed in the declining years of the momentum of the Gandhi era.

This is the cause of the sullenness, despair, anger, impatience and a general mood of disenchantment. All of us will be living in a fool's paradise if we think that a people roused can be kept in check for long. And let all concerned understand here and now that if India's political process is once again sought to be reduced to an exercise in administrative cleverness, sectarian gi-mmickry or polemical arcobatics, the star performers in this drama of deceit will be swept off the stage by the onrush of surging popular disgust.

THE SITUATION demands not gradualism but the ending of a foul system at one fell stroke. Congressmen hoping to gain from Janata Party inde-cisiveness and opportunism seem to have a very poor view of the intellectual power and ability to act of our unlettered masses. Trade unionists hoping to feather their nests by recourse to unethical populism in the place of developing a serious working class par-tisanship with the mass of deprived people will soon find themselves left by the wayside. The professional in-telligentsia hoping to strengthen their parasitical exist-ence by getting close to whoever is in power will soon be finding themselves in the tumbrils along with the other tormentors of the people. Businessmen and in-

dustrialists hoping to add to their pile by peddling their influence and raising a hue and cry about growth, incentives, concessions and collaboration will soon be caught by a storm, not even knowing what it was that hit them. Student activists, who, after demonstrating an unworthy cowardice during the days of tyranny, now are in the streets trying to prove their heroism, will soon be overtaken by a superior force and it will be too late for them to realise the cost of a marauding orgy devoid of intellectual and moral courage.

And what about our ministers and their minions? Even as they are engaged in their leisurely councils over lunch and dinner, in between their sermonising, touring and quarrelling, they are being insulted from the gathering revolt by the same kind of toadies and hangers-on as have always abounded in the lawns of their bungalows and corridors of the secretariat.

IS THERE anyone in the broad spectrum of social, political and cultural leadership who has understood the significance of the gathering popular disenchantment with the state of public life and the system of governance? There are the outward forms of consultation and confrontation without a serious effort for a national consensus on elementary honesty. Why do our leaders have to drag in Gandhi in defence of a brazen competition for power and of their apathy to moral issues matched by an absence of spiritual humility?

There is much talk of administrative reform, of police reform, of educational reform, of electoral reform. Yet there is little to enthuse the people that anything worthwhile will take place. All aspects of public and social administration are marked by a destitution of spiritual fervour. And we are sometimes told that there is nothing very wrong basically and what is needed is only a little touching up here and there. Herein is the first sign of the rot. The "rebels" have already started learning that the establishment is not the goliath it was made out to be.

A GREAT opportunity for the Gandhian alternative is already slipping away. The country seems condemned to a violent upheaval, out of which will emerge another and worse despotism. Leaders of all political parties seem to have lost even the ability to feel the situation. If they do not come together on a common idea platform to summarise the experiences of the people for the people, to revolutionise politics and governance and express that revolution in the form of an avalanche of decisions that will invest this great country with an ecstasy of pride and purpose, the forces of incoherent violence are bound to take over. Decrees must flow from the office of the Prime Minister in tune with the traditions of Gandhi era and with the democratic aspirations of the people.

The manner of uniting is more important than the fact of sticking together. Appeals for party unity are often accompanied by advice of sorts given by good samaritans that there should be no open criticism of the leadership. This is in conflict with earlier positions about the need for party men to speak out.

The argument that the affairs of the major political parties are a preserve of their inner councils has seen its day and will wash no longer. That is why the postures of outraged political morality adopted by them in regard to investigations of the management of their funds have convinced nobody.

Not merely this. It is not clear yet which part of Gandhi is being had in mind when many people are assuring themselves and others of their loyalty to his ideas. But it is innocence or worse to speak of Gandhi and think of secret politics. For the saint of Sabarmati, "the politics of the millions is my politics". And that politics cannot be decided by twenty men in authority—be it in government or in a party.

THOSE IN POWER at a given point of time would do well to remember Acton's truism (no less true because it is a truism) that power corrupts, and Gandhi's dictum that the only way of checking abuse is the dynamic vigilance of the people. Otherwise, their talk of open society will be worse than hollow.

Nobody is seriously suggesting that the problems of this country can be solved overnight. It is going to take years. And the generous people of this land will be prepared to wait, provided they know that they are not held in tutelage but are masters of their destiny. It is this sense of participation which informed the political, social, cultural and economic philosophy of one of the greatest men of all times—Mahatma Gandhi.

How was Gandhi able to infuse in the life of our nation a new spirit, a sense of fulfilment, even while the people were steeped in poverty and squalor? He made them vibrant with a sense of freedom and made them feel that this sense of being free is the basis of all other rights and duties. He made Motilal give up his practice and made millions take to khadi. Sacrifice was badge of honour, palace an object of derision. Service among the Harijans was a privilege, membership of elite society a subject for caricature. There was the strange spectacle of men moving in the streets with a *takli* in their hand, of women being in the forefront of social and political battles, of *satyagrahis* braving physical assault while picketing liquor shops, of legislators boycotting councils, lawyers boycotting law courts, of graduates boycotting convocations—in fact a spectacle of a whole nation on the move. There was hardly a village which was left untouched by the Gandhi movement, hardly a tea shop without some symbol of that movement.

HOW DID this transformation take place? Gandhi, said Nehru in an interview with a foreign correspondent, was undoubtedly the greatest revolutionary of our times, because he moved the masses.

Was it just the work of a messiah? Despite the messianic proportion of the man himself, he wrought the miracles by very simple devices. He always used an idiom which the people understood. Despite the might of his intellectual power, he did not make intellectual rationalisation the basis of his social movement. He insisted on a strict code of uniformity of sacrifice, of morality. He lived even as he preached. He gave every soldier of freedom's battle a unique individuality, a feeling that he was no less important than the Mahatma himself.

Above all, he gave the non-cooperation idea—individual courage and collective honesty.

NOBODY HAS any business to talk of Gandhi unless he is prepared to accept the concept of an open rebellion which, in our context, would also imply open government. Secrecy, the prudery of a special morality and conduct code for government servants, the closed system of administrative hierarchy, the high cost of governance—all this has little place in the India of today. They must be swept away by a flood of decisions. Commissions and councils can do no more than tinker with a system, rotten to the core.

Let there be a unity of resolve and sacrifice, of purpose and service, not a coalition of interests. Let there be an open controversy based on sincerity instead of secret intrigue eroding the ethical will.

And let not unworthy caution and the counsel of

now. Once there is evidence of this will, the mood of the country will be transformed from despair, sullen anger and senseless violence to enthusiasm, participation and challenge.

The Harijan Problem

THE CONGRESS Party's defence of the tempo of its campaign in respect of treatment of Harijans can well be that it is permissible politics. The communists have also raised this matter and there is some evidence of a determined bid to organise resistance against local tyrannies. JP has mused whether a confrontation on class lines can be avoided at all.

The prime minister has been forthright in his letter to Shri Chavan. Not even the leader of the opposition will disagree with his statement that the cause of the weaker sections and the human misery involved are too important and serious to be made the subject of polemical duels within Parliament or elsewhere Nor can the impression be completely avoided that there is a concerted effort to project government generally and the home minister particularly in a certain light. The former prime Minister's references to the plight of the Harijans have not added to the credibility of the Congress Party's seriousness in this matter.

With all the opportunism apparent in many of the postures adopted by one or the other, it is good that the debate has taken place and will continue. The vigour of the public discussion should be enough rebuff to the mischievous theory that the downtrodden have no stake in open society. Whatever the motive, the opposition has done well in rousing public opinion against a continuing iniquity.

Part of the present problem, as Shri Desai has said, is the casual manner in which land allotment was done under the much-advertised 20-point programme—another proof of the insincerity of much that was done during the emergency. Certain administrative steps have now been taken and the Chief Ministers—including those not belonging to the ruling party at the centre—are very much in the picture.

Shri Desai and Shri Charan Singh, have, perhaps, been a little tardy in another respect They should have conferred with leaders of various parties individually and collectively to find a common national approach to this problem, so that a sound policy is not frustrated by political opportunism. Even now it is not too late to do this.

The Prime Minister rightly, is not impressed with a statistical approach. It is a national shame that incidents of ill-treatment of Harijans should be occurring in a country which has been among the first to raise the banner against racial arrogance elsewhere.

One aspect of the matter has not been adequately stressed. There is a general feeling that cases against the oppressors are not registered and the Harijans, after having suffered, are falsely implicated. Some confidence needs to be restored in the justness of the law enforcement machinery.

The Naxalites have been almost the only political group which have tried to organise the weaker sections for resistance. Ultimately the problem—at least the social aspect of it can be solved only by building the strength of the people to give battle to caste tyranny. It will be a good idea if all the political parties agree to organise the weaker sections for a movement of non-cooperation with the tyrants.

the problem. The landless are not exclusively Harijans; nor are the small farmers always very much above the poverty line. There is no escape from a massive employment programme based, in the first instance, on essential construction. Simultaneously a very quick school expansion scheme will have to be undertaken. Some kind of urban culture (as Gandhiji envisaged) has to be brought about quickly in the villages. This would mean that various kinds of professional intelligentsia have to be found for useful work in the villages. One does not see why the central government should not insist that all entrants to its organised services should start their career with a ten-year tenure in the villages.

Much of this will depend on the speed with which a water management system covering every village is evolved. Service is a good motto but a harsh existence is not a necessary badge of that service.

Police Reform

IN THE last few weeks, the Home Minister has made some policy announcements which do indicate serious thinking about police reform. Unfortunately reports of many police commissions have been gathering dust and the police system is largely governed by a dispensation of over a hundred years ago. Since the advent of freedom, the police image, far from improving, deteriorated rapidly because of the increasing use of the force for putting down social and political movements. In the last decade, and more particularly immediately before and during the emergency, the police was reduced to the position of a handmaid of political intrigue Intelligence services were grossly misused and "law and order"—a misleading expression—was stressed to the extent that other branches of police function were neglected.

Investigative efficiency having been neglected, third degree methods were freely resorted to, sometimes under political patronage. Ironically a police officer, on trial, pleaded before a court that he should not be placed in police custody because he feared ill treatment.

For all this, our police force consists overwhelmingly of well-meaning personnel, who, given leadership, training and social ethos, can blossom into a fine body of public servants In two speeches, Shri Charan Singh has given indication of his awareness of the good potential in the force.

The Home Minister referred to absence of facilities at police stations. This is only an aspect of a degenerate administrative system in which secretariat offices overflow with carpets, coolers and cushioned chairs, and areas where the administration meets the people lack the minimal facilities.

Part of the problem of the police force is the career self-interest of a bossist service which would not give the policeman the respect that is his due. Anyone who attended the two seminars held by the police service association could not but have been impressed by the calibre of the officers who have chafed for long under the yoke of an aggrandising set of officers. It is good a beginning has been made in Delhi to set matters right.

The London "bobby" is often mentioned in any discussion of public affairs. It will be a good idea if every policeman—officers and others—is obliged, at least in two spells of two or three years each during his service, to do only jobs of generally assisting the

This is the come-back trail

—KAUSHIK

THE PRIMA DONNA appears in the auditorium. Fanfare, powerful lights. The show is on.

"Jail going is a matter of pride" Shri Desai has expressed his gratitude. "But jailing me is not in the national interest". The nation and me!

"Self-reliance is in danger". The rupee devaluation at the World Bank's behest came after the praise of Johnson's peace policy in Vietnam and the agreement on the 300 million dollar U.S. educational fund.

"Jawaharlal Nehru had vision." Ten years ago in Bombay, the AICC heard the statement that Nehru's economic policy was not as acceptable as his foreign policy.

"Where is direction of policy?" The first broadcast in 1966 pronounced the merit of pragmatism. (It was compared to Lenin's NEP)

"We were marching forward". Towards "derailment of democracy"!

"Prices are going up". Inflation is no longer a global phenomenon!

"Where was the need of elections?" Some wisdom indeed, though belated "The March election was my democratic commitment". But then "the Intelligence gave wrong facts and we could not size up the people's mood".

"What is this rolling plan?" Was it not better to have a make-believe plan?

"There is fear". Yes, how else does one explain the strikes and the processions? Would this have happened during the era of "discipline" or would this have been publicised during the golden age of "fearless" journalism?

"Officers are being suspended". Should they not have been rewarded?

"Where is science and technology?" Where indeed? "All kinds of things are being imported" No need, of course to go into detail." But I am not against imports as such". The retreat line.

"My arrest is good for my party". Though not for the nation! Are not the party men against you? "They are not true Congressmen".

"We have personal bickerings. They have ideological debates". What a crime!

"No economic policy yet". Shift to agriculture and small industry? "No, no, they only want to stick to power". Not like me.

"Outside forces were at work". The people did not perhaps go near the ballot box. "There is a tilt towards one power". No further questions, please!

"Where was the caucus? Only now there is no democracy"! Why is everyone allowed to move about freely, talk at will and get fully reported?

"Emergency was only to deal with economic offenders". Did you think it was anything else?

"What do you say about the Delhi floods?" Did this happen during the emergency? Patna? That was nature, Delhi was man-made.

Finally the home coming In local costume. "The knight on a lone charger".

"What I say is not reported". Quite. Oh for the halcyon days of free reporting!

"Emergency produced the Janata Party". "Otherwise there would have been chaos". Was the juxtaposition a coincidence?

"Due process of law, my foot". Releasing people who fought against the emergency! Whoever heard of such a thing?

"Fear and me, what a laugh!" James Cameron to note.

"They are trying to destroy my party". Earlier did they not try to encircle me?

Pathetic? Ignorant? Does not know planning? Planning Commission members vanishing, for they frowned on a toy car?

---

people—for instance, helping a child or an old woman cross the road, taking people to a dispensary, giving them essential information, giving first aid or transmitting a grievance and getting it redressed. This will not only revolutionise his approach to his work but will change people's attitude to the force

Another reform could be to make the functioning of the police force as open as possible. The service rules should be amended to enable the police to participate, to the maximum extent possible in public affairs. Frequent in-service training, good service conditions, greater democratisation and building the public relations system into the structure of the police force are some other possible ways of making the police a humane and effective force

Shri Charan Singh's advice to BSF—a force whose reputation at the moment is not very high—that every officer and jawan act fearlessly and do nothing inhuman or illegal or immoral even on superior command, can be the basis of a new ethos which will liberate the police from the narrow approach of "controlling" and give them a chance of "serving" the people.

A senior police officer has said the police could be disarmed. William Pitt is credited with this idea. There is really no need on most occasions for the police to wield all kinds of weaponry. More effective but less cruel ways of crowd control, statutory commissions to visit jails and to inquire into every case of police firing, clear constitutional prohibition of third degree methods, matched by a great simplification of legal and evidence procedures should all be thought of.

Wages and Income Policy

THE CALL for a wages and incomes policy by six central trade unions has a positive aspect in the sense that note has been taken of the landless labour and the generality of the people outside the organised sector. But these trade unions will have to do better if they are to convince everyone of the seriousness of their concern for those who live below the minimum consumption standards. The one to ten ratio of wages and incomes is possible only if, along with profits, dividends and high incomes in the public and private sectors, working class wages in the organised sector are also kept in check so that resources can be mopped up for a great and rapid increase in job opportunities and for improving the lot of the down-trodden. The insistence on bonus is strangely inconsistent with the concern for the rural poor.

The problem of Indian trade unionism is that it has not developed into an *avant garde* movement for the

people. And very often trade union leadership shows little sign of being other than a vested interest.

However that be, the government has no excuse for delaying the evolution of an incomes policy. This country cannot afford a high wage economy. The sooner government announces a policy of ceiling on incomes in the public and the private sectors, the better. The present ceilings bear no relationship either to the general picture of Indian destitution or to the compelling needs of attracting talent. Further, without a drastic scaling down of incomes in the higher levels and a matching abolition of many of the office comforts, privileges and the rest that go with the high incomes, government's sincerity will be suspected in the eyes of the people generally and the working class in particular.

Workers' Participation in Management

CONTRARY TO THE general belief, the opposition to the concept of workers' participation in management came in the UK from the more extreme of the trade unions. Their fear is that the working class options will be limited if management decisions are taken by, among others, their own representatives. The high degree of efficiency of the trade union movement in that country makes the task of participation easy, in the sense that the functional concept of management is not likely to be diluted by the active association up to the board level of a trade union representative or representatives. The Bullock Committee report has raised a vigorous debate in the U.K.

Indian thinking on this subject has been far from clear so far and it is doubtful whether the appointment of an 18-member committee is going to make matters clearer. Not enough groundwork has been done. This apart, trade union development in India, even where such development is positive, responsible and informed, is very uneven. However, the committee's work will give another opportunity of a basic discussion of a vital subject.

There is nothing ideological about workers' participation. It is a functional idea with immense possibilities.

Both the question of equity holdings and the trusteeship idea have been included in the terms of reference. One does not know if the labour minister has kept in mind Gandhi's diagnosis that labour often fails because it wants to become capitalist itself. Proletarian revolution or management revolution or the trusteeship idea cannot mean that ownership is only broad-based and this worker-cum-manager-cum-owner-cum-trustee is a privileged citizen in society.

Company Donations

THERE MAY be some merit in the lament of a few businessmen and industrialists that they are being penalised for furnishing information about their contributions to political parties while many others who have effectively concealed such contributions will escape. One hopes that the investigation machinery will be able to bring into the open such secret deals.

A point is likely to be missed in debates of this nature—whether they concern businessmen, bureaucrats, professional classes or politicians. If the general atmosphere of terror is accepted as a blanket extenuation of the most shameful forms of illegality, immorality and cowardice, how are we going to ensure that such terrorism—the stock-in-trade of tyrants, as Gandhi called it—will not be accepted as the easiest method of perpetuating oneself in power? Either the incipient tyrant knows in advance that tyranny will not work because the moral fibre of the different institutions of public life is strong enough to frustrate it or those who are prepared to share in the tyranny by craven acquiescence should know that, as at Nuremberg, retribution will follow as the night the day.

It will be grossly unfair to treat on par those who could not summon up courage and those who actively participated in corruption and tyranny. But then it is equally unfair to expect that only one section of brave men will always resist and invite upon themselves imprisonment, death, torture and worse and others will have the best of both the worlds.

The best thing would be to evolve a system of graded punishment for different categories of people who perpetrated, actively participated in, benefitted from or merely accepted the regime of near fascism. Between these who gave willing information and others who concealed it, there could be a difference. But none should expect to escape the consequence of his share in the infamy.

The tragedy, however, is that so many of the worst culprits seem to be flourishing under the new dispensation. One only hopes that the people will take care of those who are making this possible.

Civil Service Quarrels

SOME RECENT appointments seem to be reviving the inter-service rivalry at the senior levels of the administration. What has been unfortunate in the controversy in the last six or seven years is that the question of administrative reform is often equated with salaries and posts. Undoubtedly these have a great bearing on the efficiency of administration. The runaway aggrandisement in one section leads to mad spree of demand. The culture of the administration also depends on the relative importance given to functional and extra-functional aspects. But there is more to it than merely salaries and posts. When is the government going to change the secretariat system, a wholly inefficient one and certainly not a universal phenomenon? And when is government going to realise that an extra clerk at the booking office or X-ray counter, an extra bench at the police station or a dispensary, a few more nurses and doctors, a few more beds and clinics, should demand a higher priority than the plethora of posts in administrative offices and the attention given to the appurtenances of these offices? The consolation is that even the mightiest officer has to seek the help of a policeman, a booking clerk and, of course, the doctor. Life itself is a great leveller. There does not seem to be any course other than consoling oneself with this thought, unless the people can mount a movement for a new administrative culture.

JAYAPRAKASH

Yusuf Meherally, one of the stalwarts of the freedom struggle and of the socialist movement in India started the Padma Publications and among his books was "LEADERS OF INDIA" written in 1942. Among the nine leaders chosen by Yusuf Meherally for the book was Jayaprakash who was then only 39 years of age. Even thirty five years ago, Meherally wrote : "Today he (Jayaprakash) is one of the guiding spirits of a movement with which the future of the country is inextricably bound up".

Of this man of history, a calumny was spread by the British bureaucracy and Meherally says, "Gandhiji's magnificent reply will indeed remain a remarkable document".

Nehru said on 14-2-1948 "A time will come when Jayaprakash will play a very important part in shaping India's destiny".

Of Jayaprakash's arrest in 1940 and the British Government's calumny against him, Mahatma Gandhi wrote in the **HARIJAN** on 10-3-1940 .

"The arrest of Shri Jayaprakash Narayan is unfortunate. He is no ordinary worker. He is an authority on socialism. It may be said that what he does not know of socialism, nobody else in India does. He has forsaken all for the sake of the deliverance of his country. His industry is tireless. His capacity for ing is not to be excelled. I have said before no it is open to the government to precipitate a if they wish. They have every right to do so. Let be no camouflage. If Jayaprakash is guilty of vic violence should be proved. What the arrest has is to make people believe that the government w force the issue".

How aptly these references by Mahatma Gan the British Raj fitted but another native Raj !

Mahatma Gandhi again wrote in the **HARIJ/** 26-3-1940 :

"It is an irony of fate that Jayaprakash's patr is being penalised. What tens of thousands thin what thousands say in their talk, Jayaprakas said in public. It is true that if his words take and are repeated, the government will be embarr But such embarrassment should set them thinki stead of punishing a patriot for his open think

But like the Maxwells and Tottenhams, the Raj was drunk with power and beyond thinkir

Reproduced here is Yusuf Meherally's ess Jayaprakash taken from Padma Publications' **' DERS OF INDIA"**, written thirty five years ago

YUSUF MEHERALLY

ON A CERTAIN day in 1933 the gates of the Nasik Road Central Prison opened to discharge a tall and distinguished looking youth, on completion of his sentence of imprisonment I have little doubt that when the historian of the future comments on our times he will mark out that event as one of the significant happenings of the year 1933 For, with his release, a new force had emerged in Indian politics. Jayaprakash Narayan came out of prison with an idea, a purpose and a vision. And out of that was born the Congress Socialist Party

His is today one of the most popular and respected names in Indian public life. But few, indeed, know what a magnificent personality it is that passes by the name of Jayaprakash. Fewer still suspect the widely varied experience and adventures that have gone to the making of so fascinating a man.

He has known life at first hand. Perhaps that is the reason why his thinking is so clear. When he reached Amercia to continue his studies, he began his career not in the class-room but on a farm. He arrived in California in October 1922 to find that there were still three months for the University term to begin and he was not rich enough to keep up on his own resources. So he went out to work on a fruit farm Large number of Indians live in California, among whom are a great many Sikhs and Pathans. Jayaprakash joined a Pathan gang whose head, Sher Khan, was a picturesque figure, physically about twice the size of Khan Abdul Gaffar Khan. The non-cooperation movement had deeply stirred Indians all over the world and any new arrival from India was an interesting figure. When it became known that Jayaprakash had left his college to join the non-cooperation movement and had given up his university scholarship as a consequence, there was really no dil for him in finding a job.

THE FRUIT season was then ending and prakash worked hard from morning till amidst grapes, peaches, apricots, almonds. Afte were plucked and sorted out they were treatec lime and then with sulphur. Then they were drie sent to the factory for cleaning. Jayaprakash's was to walk from basket to basket, throwing ou fruit Perhaps that is what he is doing even now- ing out the rotten fruits from the Congress bas

So he worked for ten hours a day and sever in a week with no sundays and no holidays. B wages were attractive, forty cents an hour, worked out to four dollars a day, and at the r exchange prevailing then, fourteen rupees daily young Jayaprakash this appeared a fabulous a and in a month he was able to save eighty d Armed with this fortune he went back to Ber the fruit season having ended, to await the open the University He took a room there and did hi cooking.

One term at California and Jayaprakash was bankrupt! So he went up to Iowa University tuition fees were one-fourth of those at Calif Even to pay for these he worked on a peach f

From Iowa he next got on to Wisconsin Univ Here, a new element entered into his life, an el that was to give a completely different directi his life.

IT WAS here that Jayaprakash's restless found the illumination he was groping He had been perplexed by the prevalence of wealth and grinding poverty, side by side, ev America—the land of opportunity. What w

olution of this riddle ? Why was it that a few had all ie good things, while the vast majority were con-emned to a life of squalor, poverty and ceaseless oil ? A teacher of the University had declared that iere was no solution to the problem of poverty, in ie framework of the capitalist system, and he was nown to be an ardent socialist. Jayaprakash eagerly irned to him and a great attachment grew up between ie two. He started devouring the classics of Marxism nd, before long, but not without a powerful mental ruggle, he became a confirmed socialist His life ow took a new meaning. He gave up the sciences nd turned to a study of economics. His Master's iesis was highly praised and he was considered one f the most brilliant students at his University. He ent from here to New York where he was taken riously ill and was in hospital for several months.

He stayed in America for nearly eight years and udied at five different Universities. He started as a udent of Mathematics, Physics and Chemistry id then devoted years to the study of Biology, Psy-iology, Economics and Sociology. He had several mes interrupted his studies in order to earn enough carry on at his University for a term or two. He ad worked as a farm labourer for ten hours a day, a packer in a jam factory, as a mechanic in an on concern, as a waiter in a restaurant. He had tried is hand as a salesman When, therefore, he returned India in 1929, it was not as a raw student looking rward to a comfortable life, but as one who had en life at close quarters and was fully determined devote himself to public life.

AWAHARLAL NEHRU at once placed him in charge of the Labour Research Department the Indian National Congress. A few months later iyaprakash found himself acting General Secretary the Congress during the civil disobedience move-ent.

History will love to remember his days of imprison-ent in the Nasik jail. Along with him were a large imber of prominent Congress workers. Masani was ere, so was Achut Patwardhan.

These and other friends worked out the blueprints the Congress Socialist Party that was to be. In other ils, likewise, the younger sections of Congressmen, ssatisfied with the decay that had crept into Con-ess politics, felt the need of a more dynamic orien-tion in the outlook and programme of the Congress id had reached socialist conclusions.

Soon after his release, Jayaprakash organised the st session of the all-India Congress Socialist Con-rence at Patna which met under the presidentship Acharya Narendra Dev. The occasion was signi-ant, for the all-India Congress Committee was meet-g at the same time, to call a halt to the programme civil disobedience and to launch out on parliamen-ry activities. It was in the fitness of things that the ft wing also should organise its forces to prevent is drift to the right. Jayaprakash was elected general cretary of the organising committee. In the coming onths he worked ceaselessly, travelling from province province, gathering together the radical elements id setting up Congress socialist groups everywhere. few months later the all-India Congress Socialist irty was formed at Bombay. Jayaprakash continued be the general secretary of the party till he was made a member of the Congress Working Committee at Lucknow. He resigned from the Congress cabinet a few months later, to resume the general secretaryship of the party.

OF THE various leading workers of the Congress Socialist Party, Jayaprakash is most attracted by theory. But he is no dogmatist. His fingers are firmly on the pulse of the people. He dislikes nothing so much as narrow sectarianism. If the Congress Socialist Party is something more than a political party—a powerful movement, with a larger and larger section of the radical elements coming under its ideological influence—not a little of the credit is due to Jayaprakash.

As a writer, Jayaprakash is the master of a style that is at once simple and direct. His book, "Why Socialism ?" has been acclaimed as a masterpiece and is certainly one of the finest books written on Indian affairs. As a speaker he is no orator, but by the sheer force of his sincerity and a thorough grasp of the subject he makes a greater impression than most orators

HE HAS two vices that I can discover. The first is the possession of a magnificent shaving set. With a beaming smile he will tell you that it is the finest in the town. When one has a face as handsome as Jayaprakash's this may be pardoned !

I do not know how to describe the other unless I call it a lack of the time sense—for to call it merely unpunctuality would be prosaic. The fact is that Jayaprakash loves a good discussion, especially with an intelligent opponent, and will miss half a dozen appointments to do so But at these times when he comes late, such genuine misery is written on his face, that he seems to endear himself all the more by his very unpunctuality !

For the best part of three years he has been rotting in prison The memorable hunger-strike at the Deoli detention camp, where Jayaprakash and a number of his fellow detenues undertook an indefinite fast to secure the redress of their grievances, thrilled the whole country. A wave of enthusiasm swept over the entire land. Victory came after 31 days of hunger-strike, but it gravely affected the health of many of these brave comrades. Jayaprakash, whom the bureaucracy had sought to discredit by the publication of a letter, said to be seized from him, emerged from the trial as the hero of Deoli Gandhiji's magnificent reply to the government about the publication of that letter will, indeed, remain a remarkable document.

Jayaprakash is still young. He is scracely thirty-nine and has a fund of knowledge and experience that few people in this country can lay claim to. Gentle as he is, he can be firm and has shown that he has the courage to make big decisions. Above all, it is the human qualities of the man that cast a spell on all those who come near him.

SUCH IS JAYAPRAKASH, unassuming, generous to a fault, honest as the day, working for a glorious tomorrow with the materials of today. This simple peasant lad, born in the tiny village of Sitabdiara in the Saran district of Bihar, saw a tram car for the first time when he was nineteen years old. Today, he is one of the guiding spirits of a movement with which the future of this country is inextricably bound up. □

Social service to be effective has to be rendered without noise. It is best performed when the left hand knoweth not what the right is doing

— Mahatma Gandhi

PROHIBITION

How Gandhiji Tackled the Problem

J. B. KRIPALANI

NOW A DAYS THREE is much talk about prohibition. In our constitution, it is one of the directive principles of state policy. The Janata Party is pledged to bring it about. The Prime Minister wants total prohibition throughout the country within the next four years. His colleagues in the centre and in the states seem to agree with him. It will not, therefore, be out of place here to describe how Gandhiji tackled this problem which, about everything else, he considered a moral one. He had to tackle it without the aid of the law and the corrupt police. I can describe his methods as I saw them being carried out and also as one who participated in the prohibition movement.

Gandhiji never placed before the people an idea which he himself had not put into practice. He was a lifelong teetotaller. Every intending member of his asharm, according to its rules, had to give up the use of intoxicating drinks and drugs. He then induced the biggest and the most respected and patriotic organisation in the country, struggling for the freedom of the motherland, to adopt a resoultion that every member who joined the Indian National Congress should pledge himself to abjure liquor and other intoxicating drugs. This meant that most of those who were in earnest to serve the country had to give up intoxicating drinks and drugs. Their giving up meant generally that their family members, specially the women, also accepted the restriction of prohibition. What a large section of population this meant !

AMONG THE TRIBAL PEOPLE

This was not all. Wherever Gandhiji went, he propagated the idea of prohibition. If it was a tribal area he was visiting, he would invite the heads of the tribes and would induce them to give up the drink habit not only on grounds of economy, but also as a moral duty to themselves and to their families. It was not difficult to convince those poor and innocent people of the benefits they would derive from giving up the drink habit. They had their personal experience to back Gandhiji's advice. He would request them to call a meeting of their fellow tribesmen whom he would then address on the evils of drinks. After that, the tribal leaders would administer a pledge to their followers to give up strong drinks. Gandhiji would so manage all this that it would appear to the tribals that it was their own free decision arrived at by themselves, without any pressure from outside.

In non-tribal areas, Gandhiji would invite the leaders of each community and convert them to his views Then the leaders would call a meeting of their community, where a solemn pledge would be taken against the use of strong drinks.

Gandhiji even encouraged the office-bearers of fashionable clubs in the cities he visited and convince them of the need for abjuring strong drinks. The leaders would then call a meeting of the general body of the members of the club and a resolution would be passed that no strong drinks would be served in the premises of the club.

He would then call special meetings of women and ask them to persuade their menfolk to give up the drink habit In India at least in those days, women of respectable families and of the higher castes rarely drank. Those who did, did so in secret; such was the pressure of public opinion. Gandhiji would also request religious leaders to advise their congregations to give up the drink habit. Generally in India priests do not drink. If any priest was found drinking, his following would dwindle away.

Gandhiji even encouraged the picketing of liquor shops provided it was scrupulously non-violent. For picketing liquor shops, he preferred women to men volunteers.

RELAXATION FOR WORKERS

Gandhiji was alive to the fact that workers, especially those doing hard labour in the field and the factory, did need some relaxation. For this purpose, he suggested that every liquor shop be turned into a well-furnished restaurant. There, the customers could sit at leisurely ease and carry on the gossip of the day over cups of tea and coffee and glasses of various fruit juices, s rups and other soft drinks. The should be self-service in such re taurants; only one or two waite according to the size of the resta rant, need be engaged to clean t tables. In addition to soft drinl sweets and snacks should be provi ed in such restaurants. Radio a good music should also be provi ed . They could be self-supportii Restaurants become costly whe many waiters are engaged. Ho ever, if such restaurants fail to self-supporting they should be su sidised by the local bodies or t state government. In every wa they should be attractive.

These methods to bring abc prohibition were put into practi by Gandhiji under an alien gover ment which would not extend to t reform administrative and leg support. Rather, it put hindranc in the way of the reform and t reformer. Those who picket liquor shops were marched off jails. The authorities rigthly belie ed that a reformed India will be free India.

When there was provincial au nomy in the late thirties, he want the provincial governments to leg late against the evil of intoxican But it was carried out unfortunat by the ordinary police. Howev Gandhi's influence prevailed to large extent.

AFTER ADVENT OF FREEDOM

What did we do when we achie ed Swaraj ? Prohibition laws we not made applicable uniformly in the Indian states. In some stat only a few districts were declar dry. In the rest, use of liquor w permitted. It was not difficult f the rich to cross over and have th daily dose of liquor. The prohibiti laws were executed by the ordinar corrupt police. The rich often fou it convenient to get their liqu through the police The poor had content themselves with some sp rious drink in the name of liqu How often have not many po drinkers been killed by having co sumed some poisonous drink, pas ed off to them as liquor ? Yet, t miscreants who supplied such po son have often not been traced a punished. Such adulteration and sa of liquor does not take place wit out the connivance of the police.

Now that our Prime Minister h promised to see that the whole cou try will go dry within four year may I suggest that the enti emphasis need not be placed on t law ? After all, the laws are enfor ed by the police. During the rece

emergency, the police has not only become more cruel but also more corrupt than before. Steps will have to be taken to introduce a cadre of honest policemen to ensure proper implementation of the prohibition law.

But more than that, steps should be taken for the reform in the light of what Gandhiji did and suggested, when he had neither the legal authority nor police assistance to carry out this reform.

Unique Factors

In my view, India is the fittest country in the world where prohibition by law can succeed. Before some of our people became very rich during the war and through the five-year plans and through the prevalence of the black market, generally the higher caste people among the Hindus did not drink. Liquor was not kept in their houses If anybody wanted to drink, he did so in a hotel or a fashionable club. It is not usual in India to offer liquor to visiting guests. Only in highly sophisticated and rich families is liquor ever kept and offered to guest. Jains as a community do not drink. So also the vaishnavite section of the Hindus. The Muslims are prohibited by their religion from drinking. Even where men drink, women scarcely do so As for the poor, if one asks them whether it is good to drink liquor, their reply will be an emphatic 'no'. Suchetaji was a member of a committee under the chairmanship of Bakshi Tek Chand. She told me of her experience in the labour class, and the poor in general. When they were asked if they wanted the liquor shop in their neighbourhood, the straight reply was, "Please take it away; its existence is a temptation which few of us can resist."

The poor never talk of the invasion of their personal rights They do not think that they have the right to do the wrong thing. It is only the sophisticated and the new rich who say that prohibition will interfere with their personal liberty. In our Constitution, there is a section on fundamental rights It talks of the right to free speech, freedom of association, freedom to profess and propagate any religion, etc. But there is no fundamental right to consume intoxicating drinks and drugs. All other rights except the 'fundamental rights' are subject to legislation by Parliament and state legislatures. It can easily be perceived that the drink habit, specially among the poor, is not only against their economic interests and those of their families, but against their morals and often against public peace. In any case, if it is a sacrifice for the rich, the educated and the cultured sections of our population to refrain from drink, they cannot absolve themselves from their duty to the poor whose whole life and that of their families are ruined by drink. Today, even affluent nations are expected to help the poor nations. What harm is there if the rich forego some of their pleasure for the benefit of the poor of the country, on whom their prosperity largely depends? The needs and the demand of the poor of this country are not unjust in this inter-dependent world of ours. □

EMPLOYMENT AND GROWTH

Are they Antithetic?

DR. M. P. PANDEY

THERE HAS been occasional controversy about how to deal with problem of employment. The controversy came to a head at the time of preparing the fifth five year plan, which led to the supersession of one draft by another.

The controversy was whether the problem of unemployment should be tackled in its exclusiveness, without regard to growth, or whether attention should be on stepping up growth rate as such, which will take care of the problem of unemployment. The first Approach paper observed that "the main causes of abject poverty are (i) open unemployment; (ii) under-unemployment; and (iii) low resource base of a very large number of producers in agriculture and service sectors." It further observed that the elimination of abject poverty will not be attained as a corollary to certain acceleration in the rate of growth of the economy alone In view of this it was suggested that there should be 'direct attack on the problems of unemployment, under-employment and massive low and poverty'

The second Approach paper had a different view According to this 'the twin causes of poverty are under development and inequality. It, therefore, maintained that growth and reduction in inequality are both indispensable for a successful attack on mass poverty. It felt that action will not meet the challenge of unemployment and mass poverty. The capacity to offer gainful employment in a sustained manner ultimately depended on the growth and development of the economy of any country. Hence it was argued that the question of stepping up growth should be the prime concern of planners.

At this point it seems desirable to look to the past to find out what has been the position of employment among the major objectives of the earlier plans. The first plan was essentially a rehabilitation plan, intended to recoup the damages suffered by the economy in the wake of the second war, and the partition of the economy. Real planning in the country is supposed to have started from the second plan. Among its many objectives the foremost was 'rapid increase in national income so as to raise the standard of living in the country. In the third plan the emphasis shifted to 'self sufficiency in foodgrains and increase in agricultural production to meet the requirements of industry and exports'. But the essential objective of growth was again reiterated. In fact, the first among the various objectives was securing an increase in national income of over five per cent per annum. The fourth plan set before itself two principal objectives, namely, 'growth with stability' and progressive achievement of self-reliance There was reference in this plan to 'creating more employment opportunities in the rural and urban sectors so as to absorb the entire labour force' This qualifying objective again made the principal objective relating to employment ludicrous.

Main Focus So Far

On the face of the above facts, it becomes clear that ever since planning started in the country the main focus has been on growth. The question of employment was there in the minds of the planners, no doubt, but it was never the core problem, as it was made out to be in the first Approach paper of the fifth plan. It was supposed that rise in the growth rate would automatically

take care of the problem of employment. The planners were clear in their mind that problem of unemployment was essentially the outcome of economic backwardness coupled with inequal distribution of resources. Naturally they attempted first to augment the growth rate, sidetracking for the time being issues like unemployment.

Double Failure

Now the new government has again brought the issue of unemployment to the fore. A question, naturally, comes to mind whether the last controversy of growth vis-a-vis unemployment raised at the time of formulating the fifth plan is likely to erupt again. It may; one does not know.

The point is that one can afford to ignore a chronic problem for the time being, if another problem becomes acute. Growth is a problem in the Indian economy which is chronic in nature. In spite of our attempt at planning for the last 26 years, we have not attained a steady growth rate. The reasons for its not happening are again chronic in themselves. But in the meantime the problem of unemployment has become acute and critical. Its solution admits of no delay. But what is done to deal with the problem of unemployment cannot be at the cost of growth. This was the bone of contention at the time of finalisation of the fifth plan. Theoretically it is possible to choose a line of action which, will while promoting employment will also promote growth. The model built for the second plan had this basis. The appropriate choice of technique is vital to any planning. Unfortunately the experience suggests that there has been a failing in making this choice, and a double failing in implementing whatever had been the choice. On the face of it, it is hoped that the old controversy of growth versus employment will not come up again and due thinking will be given to how we can have the one without greatly sacrificing the other.

TOWARDS ENDING RURAL POVERTY

New Industrial Policy

I. C. Puri

ABOUT 15 million rural artisans, 35 lakh handlooms and a large number of agro-industries utilising rural resources and over 2 lakh tiny units account for considerable employment at comparatively low volume capital cost. But many units are not fully employed because of lack of product diversification to meet consumer demand, low purchasing power of the mass of population, irregular supply of raw material and finance and above all absence of marketing channels. These industries could mobilise resources of capital and skill which otherwise would remain unused; they contribute to output almost immediately, since the gestation period is short. Cottage, village and small scale industries help regional development, reduce overcrowding in bigger cities, ensure more equitable distribution of the means of production and national income and bring about integration of rural and urban economy.

Whereas the investment needed for providing employment to one person ranges between less than Rs. 1,000 and Rs. 6,000 in village and small industries, the corresponding range of investment in the large-scale industries is between Rs 40,000 and 100,000. If 70 to 80 million are to be provided employment in the next decade, large industries do not provide a solution because of the enormous investment required for the purpose and their urban base.

In the last 30 years the village economy was divorced from industrial activities. This led to unbalanced rural economy solely dependent on agriculture. This has to be reversed by appropriate and intermediate technology.

In the last week of July, there was a meeting of senior officers of Small Industries Development Organisation at Bangalore at which the operational implications of the new industrial policy were explained to field officers. For maximum production of consumer goods, the field officers have tentatively listed out suitable product lines from a regional or local angle. The exercise involved identification of industrial consumer goods, originating in some processing or manufacturing activity, which have entered into the consumption pattern of the various strata of rural society. As the purchasing power of the people increases, there will be a greater demand for some consumer goods than others. The field organisations of the Development Commissioner, Small Scale Industries, have also to identify the existing units which could raise their production and productivity; identify new entrepreneurs who could be encouraged, undertake intensive activities of setting up new units and arrange training of existing artisans in areas covered under the rural industries projects, rural artisans programmes and in backward areas.

Upgrading of Skills

Optimum use of human and material resources would require upgrading of skills of the existing semi-skilled and unskilled workers; in-plant or on-the-job experience to fresh entrants; training of agricultural labourers and rural workers on household and non-agricultural occupations and ensuring raw material, finance and market when they raise their production or get into production. In this extension and training programme, the emphasis would be on utilising local material resources. This would require a tie up with the research in science and technology undertaken by different CSIR institutions.

In the case of village and small scale industries, the policy of preventing monopoly concentration of economic power would require that large industries do not enter in the small industry sector directly or indirectly; that concessions and encouragement are given to tiny units; and the tendency of the big among the small units to start a network of small units in the same state or in different states is discouraged. There is another direction in which measures would have to be undertaken to prevent concentration of economic power. In the case of reserved items—product lines which have been reserved for development in the small scale sec-

STEEL—
DESIGN FOR PROGRESS

Steel spells progress; and steel plants are changing the face of India.

Dasturs design the plants that make and shape steel Plants large and small, to produce steel of diverse types—using Indian raw materials, with Indian know-how—tailored to suit individual requirements. Also, plants for alloy and special steels and ferro-alloys, foundries/ forges, rolling mills; metalworking plants etc.

Pioneers of self-reliance in steel plant engineering in India, Dasturs are in the forefront of steel plant design and technology . □ Pelletization □ Sponge ironmaking □ Electric arc furnace steelmaking □ OBM steelmaking □ Continuous casting □ Electro-slag remelting □ Vacuum degassing etc

They are retainer consultants to the Government of India; also consultants for the new steel plants at Visakhapatnam and Salem; Alloy Steels Plant, Durgapur; IISCO and Rourkela, the Super Alloys Project, Hyderabad etc.

As in India, Dasturs are actively planning steel development in the Arab countries, South-east Asia, Africa and Latin America. They are the principal consultants to the Government of Libya for the Misurata Iron and Steel Complex.

tor and some ancillaries—there is a tendency to produce them captively by the large industries. Not only has this tendency to be discouraged, but the components and parts which could be economically and technically produced on a decentralised basis may also have to be offloaded to tiny units. If necessary, this may have to be done with the support of legislation.

The census of small scale industries has revealed that some products and processes provide larger employment than others. It has been found that in the case of fruit and vegetable canning, leather tanning, readymade garments, safety matches, fireworks and agarbatti the employment generation is much larger. These and similar employment-oriented industries will no doubt have to be developed. At the same time indigenous and export markets will have to be found for them so that their employment potential may be fully exploited.

To make the industry responsive to social needs the extension officers of the small industries development organisation would provide technical assistance for reducing costs and would keep a watch on prices. The small industry would meet the social needs if it produces goods and services required by the masses, modern agriculture, educational institutions, public health organisations and construction activities in sufficient quantities and at cheaper prices.

Administrative Measures

The implementation of the new industrial policy would call for specific measures, administrative and promotional. Some of these are indicated for the purpose of a wider discussion

The government is committed to the development of agriculture, village and small industries as a means of removing poverty and unemployment. In the rural areas the character of employment and unemployment has to be assessed with reference to productivity and income. Coordination of various development programmes like integrated rural development, the marginal farmers and agricultural labour scheme, the rural industries projects, the rural artisans programme and schemes relating to silk, coir, handicrafts, poultry and dairy, would yield better results. In the case of rural industries projects and the rural artisans programme, which are centrally-sponsored schemes, some measure of coordination has been achieved. Increasing the productivity of labour, raising the purchasing power of the masses and creating additional employment opportunities are different aspects of the same goal, namely removal of poverty. Production has to be diversified; intermediate technology adopted and markets opened beyond the local boundaries of a village or a group of villages or even a state.

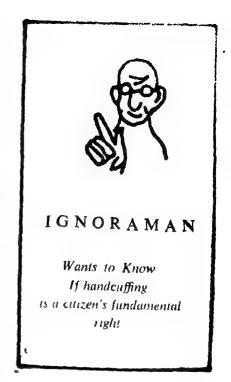
The accent of the small industry programme would be on the promotion of tiny units. Facilities, concessions and subsidies will be linked to employment generation Instead of a capital subsidy for development of industries in backward areas, some kind of employment subsidy may have to be introduced. The form of the subsidy will have to be worked out.

The rural industries projects and the rural artisans programme would be the core activity of the small industries development organisation. The small sector in urban areas which have reached a stage of maturity may have to rely on its own resources.

There has been in recent years an impressive increase in the scale of credit provided by commercial banks to small scale units Yet, several units particularly cottage, village and tiny units, are outside the scope of institutional and bank credit The study team of the State Bank of India which went into the question of sickness of small scale units, has pointed out that these units have very limited resources which do not permit any margin of error and that they lack equity.

Marketing Organisation

The conclusion seems to be that the banks and other financial institutions are still unable to meet fully the requirements of village and tiny units. Arrangements on the lines recommended by the Administrative Reforms Commission for an apex financial institution may have to be reconsidered.

All seem to agree that market intelligence, brand image, and insecure market demand are great constraints to the growth of village and small industries While improvement in the purchasing power will be a real assurance of a secured demand, a suitable market organisation, centrally sponsored or of a federating type, is a matter on which there could be more than one view However, the small units may have to be assured of a minimum quantity order so that


lack of demand and delay in payment of goods supplied do not come in the way of increased production.

Procedural formalities of various departments like excise, water and electricity and sales-tax would have to be taken care of by the development agency through centralised clearing arrangements The individual units will have to be left to concentrate on production.

There would have to be a rational and simplified procedure of reporting production, employment and consumption of raw material so that the results of the development programmes may be monitored and assessed and programmes redrawn on the basis of data

If rural poverty is understood as low productivity and income, under-employment, seasonal unemployment and disguised unemployment, both poverty and unemployment in rural areas would be mitigated to a considerable extent through arrangements suggested earlier. The salient features of these arrangements are diversification of production, upgrading of skills, minimum assured market and supply of inputs and finance. The necessary infrastructure and training would also have to be provided. Whereas this would change the existing character of employment in rural areas, the addition to the labour force would have to be absorbed in larger measure in village and small industries. □

PHILIPS
For Factory Lighting that's Scientific
To boost up productivity, the lighting in your factory must be just right—even, effective and yet without glare.
To meet these needs, Philips makes a variety of energy-saving lamps and luminaires according to the highest international standards.
Also of great use to industry is the Philips Reflectalite which delivers more light where it's needed, even in dusty conditions. Philips luminaires are rugged in design for long-lasting service.
Full value for money.

Schumacher Bhavan

R ENAMING one of the many Bhavans in New Delhi after chumacher may be a good way of ıcknowledging the validity for us of ıs ideas and also of affirming our ommitment to the Gandhian maxim ıat "the supreme consideration is ıan".

This extraordinary world citizen ıased his economic philosophy not ın mere concepts of "growth rate", development" and "economics of cale", but on a basic premise that he goal of endeavour should be an mprovement in the human circumtance. "An entirely new system of hought is needed", he fervently ırgued, "a system based on attention o people and not primarily attention o goods".

After Gandhi, many great men of ʋur times have been troubled by the lisastrous course of the nineteenth ·entury legacy of what Schumacher ımself called "the economics of gigıntism and automation". Chief ımong them was Mao Tse-tung vhose experiments with backyard lurnaces evoked diversion from the 'wise" economists. That the experinents did not succeed does not letract from the human ethos behınd the idea. The cultural revoluion was a conscious attempt to bring the people again into the picture in ı state which threatened to become ı monster production apparatus with ıll the consequent concentration of :conomic and political power. Mao's ıdea incentive as against the material ncentive has been termed more Hegelian than Marxian. The labels are unimportant so long as the ·fforts for human emancipation revolve round man himself, not the machines.

If Schumacher called Gandhi "the ;reatest economist of the twentieth country" (a view very much shared ɔy Gunnar Myrdal), he also accep·ed the human basis of the Mahaıma's economics. Look at the remarkable identity of ideas. About his new system of thought, the author of "Small is Beautiful" said, "It could be summed up in the phrase—production by the masses rather than mass production". He further said. "Production should be from local materials and mainly for local use". Gandhi said, "Distribution can be equalised when production is localised, in other words, when distribution is simultaneous with production. Mass production takes no note of the real requirements of the consumer......The machine should not tend to make atrophied the limbs of man".

The mission of men like Schumacher was to tell the world that economics cannot stand apart from man's cultural development and cannot itself be the instrument simultaneously of supposed material advance of the people and their real enslavement to a ruthless system of exploitation. A scheme of progress which ignores the social and moral consequence is no scheme at all.

Schumacher had a unique charm of presentation of his case. Writing or speaking, he delighted as much by the cogency of his logic as by the authenticity of his humour. On his being called a crank, he remarked, "It is an excellent thing, a crank. It is not expensive, it is relatively non-violent and it causes a revolution."

It was one such crank that caused a revolution in India. In Shri Chavan's eyes, "Small is Beautiful" could be (to use the author's words) "a kind of nostalgic nonsense" even as Gandhi's cottage industries seemed to the Congress Party to be primitive rubbish. Oh, for fewer wise men in this hapless world !

Are There Gangarams Now ?

ALMOST exactly a hundred years ago he had helped in the completion of the Amritsar-Pathankot rail link. He was hardly twentyfive then. His passion for learning took him to England where he studied water-works and drainage construction. Then came his memorable association with the building of modern Lahore. His fame preceded him wherever he went. Honours came thick and fast; and, in the fitness of things, (for bureaucracy was as efficient then as it is now), he was overlooked for promotion. It was time to quit government service.

The story thereafter reads almost like Somerset Maugham's Verger. At the age of 52 he started on remaking Patiala. Seven years' tireless work and then a period of rest in England. What a strange holiday ! He travelled some 15,000 miles, studied English farming and returned with an assortment of tools and passion for agriculture

Water was the problem then as now. Characteristically, he asked, "What can I do with my experience in engineering ?" What, indeed !

Defying rain and sun, he plunged into his new tasks. He was working on a barren stretch of land in Lyallpur with the nearest railway station 25 miles away. His experiment : lift irrigation by steam power or by electricity. In three months he completed this experiment and the first *rabi* crop was havested in the arid soil.

He had wished simultaneously to harness power from the many canal falls in Punjab. But he had to reckon with the secretariat's delays. He waited for fourteen years. In 1917, when he was 66, he was given on lease some 65,000 acres in two instalments. This was high land, unirrigable by canals. He was to provide irrigation by hydro-electric power and restore the land to the government for settling the soldiers back from war.

The full story of this pioneering and daring venture need not be repeated As an eminent man said, the achievement "reads like a romance".

Such a man was Sir Gangaram. And his work in social reform is another saga, even as his charity makes a fabulous story. His ideas on industry, education, women's uplift mark him out as an eminent Indian of all times.

If the issue of a stamp in his memory has only significance, it is a reminder to our engineers and technologists that there are vaster challenges than a competition for posts and salaries with a decadent bureaucracy. Opportunity—great opportunity beckons to them—to improvise, innovate, dare and act. Not all the secretariat's contumely can stop the Gangarams of this world. The question is, "Do we have them now ?"

Sanjaya

A Review Article

The Endorsed Vision of Gandhi

KRISHNA CHAITANYA

HOW SHOULD one approach the task of reviewing the reprint of a book on Gandhi that was published in the early twenties, when another quarter of a century had yet to elapse before Gandhi confirmed the message of his life in the manner of his death, and yet another quarter of a century has gone by since his death ? One good approach seems to be to note the vicissitudes of his ideas in the half-century that has passed since the writing of the book and also to check—with our advantage of hindsight, one should add in fairness—the insights or difficulties of Rolland in assessing those ideas that seemed, at that time, to be so strange, if not obscurantist or even reactionary

The early twenties even the Great Depression was a decade off and undreamt of. It is not surprising therefore, that Rolland has some genuine difficulties in understanding Gandhi's ideas about the industrial-technological culture, about the use of the machine, about the return to crafts—ideas that seem to be associated with lost pastoral epochs He reads them as motivated primarily by a revivalist bias, a desire to return to the "ancient culture", to the "plough and the spinning wheel", to a feeling that India "has nothing to learn from other nations" Rolland has the feeling that this attitude may seem to imply "a denial of progress"; he hastens to defend Gandhi, but the only argument he can find is that technological-economic progress is the forward march only "of a certain *phase* of the human mind" That is, he feels no misgivings about the progress of the industrial- technological culture being really a forward march, and its ability to fulfil its promise of assuring material affluence to every one

That was a serious misreading, though we are able to see this, not because we are wiser than Rolland, but because we have the benefit of hindsight, the experience of a whole half-century of disenchantment. The person who said that to the hungry man God dare appear only in the form of bread can never be accused of ignoring the primacy of the material needs of the human being without which he just cannot survive, though he would not have conceded their ultimacy any more than Rolland. If then he rejected the economy of mammoth technology and industry, one main reason was that he was convinced that it would not be able to guarantee affluence or even sufficiency to every man, as the basic motivation behind it militated against this But Gandhi was not a writer of text-books on economics and, therefore, we have to do the exegetic analysis for understanding his vision.

To condense in a para what would need a book to argue and substantiate · as Reinhold Niebuhr has pointed out, the 'I' is so intimately related to the 'mine' and the 'Thou' to the 'Thine' that relations of accor[illegible] or conflict between individuals imply questions of pos[illegible] sessions When life is very intimately united to life as in the case of the family, questions of mine an[illegible] thine are resolved in a sense of common possessions Accepting Tillich's definition of religion as ultimate con cern (which, incidentally, would disqualify some insti tutional religions and qualify some attitudes of secula[illegible] humanism), one can say that religious 'meta-economics' seeks to control economics from the perspective of th[illegible] family of man This is why you can come acros[illegible] passages which read astonishingly 'socialistic' in medie val Christian saints like Basil, Chrysostom and Aqui nas and see the same outlook in the concept of th[illegible] trusteeship of wealth, of the greater obligations of th[illegible] relatively more affluent, in both the Buddha an[illegible] Gandhi But what is the motivational thrust, the foc[illegible] inspiration, behind the frenzied activity of our moder[illegible] epoch ? Adam Smith, its founding father, laid dow[illegible] that man can be triggered to action only by self-intere[illegible] and went on to say that this was all right because a 'invisible hand' would arrange plenty for all fro[illegible] the selfish rapacity of each Till Weisskopf, economi[illegible] turned humanist, subjected economics to an exte[illegible] tialist analysis very recently, no one seems to hav[illegible] realised that Smith was making presumptuous assum[illegible] tions about the nature of man and the design of histor[illegible] But the Book of Smith became the Bible for a cu[illegible] ture which the Social Darwinism of a later day fu[illegible] ther helped to entrench itself. It has now develop[illegible] into an anti-culture which R. H. Tawney called t[illegible] "acquisitive society" and Bertrand de Juvenal terme[illegible] the "civilisation of ever more".

The consequences have been many, all equally di[illegible] astrous Smith's crude psychological reading of ma[illegible] encouraged, indeed sanctified, the individual's adversa[illegible] role against the whole world . the world of nature [illegible] well as the world of his fellow-men. The exploitation [illegible] nature has been rapacious beyond all need for con fortable survival; and studies like *A Blueprint for Su[illegible] vival* and those of the Club of Rome have shown th[illegible] the criminal greed blessed by Adam Smith has ended [illegible] in the imminent danger that the life-support resour[illegible] systems of the planet would be exhausted with[illegible] a matter of decades There is some lingering ho[illegible] that mankind can still be saved, but this will ne[illegible] man's change-over, in his economic motivation, fro[illegible] greed to need. And to curve back to Gandhi, a[illegible] Rolland's difficulty over his economic philosophy, [illegible] us quote from a 1976 editorial in *Acorn*, organ of t[illegible] Midwest Energy Alternatives Network, USA : "Mu[illegible] the era of recognising the natural limits of global r[illegible] sources spell deprivation and hardship for many ? A[illegible] answer suitable to every nation comes from Gand[illegible] when he said : 'there is enough for everyone's nee[illegible] but not enough for everyone's greed'."

Gandhi also expressed his conviction that peac[illegible]

MAHATMA GANDHI by Romain Rolland; Tr from the French by Catherine D. Groth; Publications Division 1976; Pages 125; Price Rs. 7

harmony between men, and between nations, were not realisable in a factory civilisation. When a man sees half a century ahead of his time, he may sound obscurantist to his contemporaries. But isn't this fairly obvious today? And the analysis of why it has turned out to be so is also not very difficult today. In the roseate picture of the ever-expanding and ever-ascending spiral of prosperity, monopoly first, and cyclical depressions later, were disturbing and irritating presences. The latter were at first brushed aside by theory as local and temporary phenomena. But Keynes discovered that they were inevitable in economies founded on Smith's principles. Instead of seeking more truly human principles, Keynes advocated the rejuvenation technique of continuous and large-scale public spending. Smith's basic reading of man had placed him in an adversary role in relation to others and this pattern spread to the relations between nations. That this would happen inevitably had been made clear two thousand years ago by Socrates. In the second book of *Plato's Republic*, Glaucon says that sufficiency does not suffice for him, he has a right to luxury. The relentless logic of Socrates forces him back, step by step, until he has to admit that a nation can maintain luxury for itself only by the predatory exploitation of other nations and this would unavoidably lead to war in which all nations may perish In spite of this, in our times, Keynesian public spending became easiest and compulsive in the war industry An inhuman reading of human nature by economic theory, and the compulsions of economic practice flowing from it, have brought mankind under the shadow of the mushroom cloud of the nuclear bomb

Today, Gandhi's advocacy of the plough and the spinning wheel does not have to be defended against the charge that "it stands for a denial of progress" as Rolland felt constrained to do and did not manage too well. Gandhi was merely anticipating Schumacher's insistence today on a "technology with a human face" Carlyle and William Morris in an earlier epoch, and Fromm, Marcuse, Mumford, Ellul and a host of others in our own times, have shown that a runaway technology has broken loose from the control of man ceased to be a tool, turned against him and is now threatening him with extinction Would any one have imagined that in the USA, which has all along been in the forefront of the Faustian thrust of ever-advancing technology, a movement would rapidly gain strength for the use of solar heaters, wind mills, recycling of wastes, organic farming in preference to agribusiness with machines which use up lot of power?

Another very important aspect in which Rolland's reading now stands in need of correction is the meaning of political, or social, action for Gandhi. Rolland says: "Gandhi is religious by nature, and his doctrine is essentially religious. He is a political leader by necessity, because other leaders disappear, and the force of circumstances obliges him to pilot the ship through storm and give political expression to his doctrine." This is not in agreement with what Gandhi himself says in the introduction to his autobiography: that his aim in this life was *moksha* or self-realisation and that his ventures in the political world were directed to that end. Totally unconcerned with academic philosophising, but intensely existentialist in living, Gandhi was actually sweeping away the ambiguities in our tradition regarding Being and Becoming, transcendental and historical existence. This issue is very important and that is why this reviewer selected it for extended discussion when he was asked to give the Gandhi Peace Foundation's annual memorial lecture this year. The agrument can only be very briefly condensed here Schweitzer's distinction of world—affirming and world-denying outlooks is valid though, in mentioning only India as an instance of the latter, he forgot his own tradition—Jerome who had nightmares because he felt guilty about his love for classical culture, the Desert Fathers, Simeon Stylites who lived atop a tower for twenty years, Origen who emasculated himself. However, it is true that there has been a strong and unfortunately prestigious current of philosophical thought in India which held historical existence to be illusory This was not the message of the Gita At first stunned by the collapse of Rome under the onslaught of the Goths, Augustine rallied and reaffirmed his faith in the City of God and showed that it was our duty to make the City of Man conform more and more to it. Likewise, the Gita is an existentialist musing, right in the midst of a historical crisis, moments before an imperial system spearheaded by the thrust of egoism was sucked down into the vortex of war, and those who resisted it had to be shown that they had to escalate their motive from selfishness to the imperatives of self-realisation. About the eschatological fate of the soul, Gandhi has been as reticent as the Buddha. But we are incarnate beings, not disembodied spirits, and seeking to raise the politically, economically or socially oppressed is not trying to make an illusion more roseate; and the commitment to conscience needed in this struggle, which may often end in martyrdom and did in the case of Gandhi, is the supreme realisation open to embodied beings. Redemption is possible in history, further since Absolute Being presumably does not stand in need of any redemption, any further self-realisation, we can say that redemption is possible only in history.

But these corrections of Rolland's analysis, though necessary, do not at all affect the fact that in this early book we have the antiphonal response of a sensitive mind to a noble person The half-century that has elapsed since it was written has not outdated it

---

Unless the capitalists of India help to avert that tragedy by becoming trustess of the welfare of the masses, and by devoting their talents not to amassing wealth for themselves but to the service of the masses in an altruistic spirit, they will end either by destroying the masses or being destroyed by them.

Mahatma Gandhi

:redit for Rural Development

I. J. Naidu

INSTITUTIONAL CREDIT has played an important role in :celerating rural development. has helped adoption of new chnology for agricultural :velopment.

The performance of the credit stitutions has to be judged not one by the volume of credit lvanced for agricultural development but also by its capacity to eet the challenge of reaching out the small farmers, rural artisans, ;ricultural labourers and other embers of the weaker sections of e community.

Attention of credit policy-makers is to be focussed on the rural poor it as a measure of charity or social rvice but rather because they are e largest body of producers and ovide immense labour resources. xperience has shown that they are ore productive where land is arce and labour more plentiful.

All these call for structural ianges in the institutional frameork. The most important prequisite is the establishment of tegrated credit-cum-services stem at the base level. The commendations of the National ommission on Agriculture about .e organisation of farmers' service ocieties (FSS) is significant. These ısume total responsibility for agroıral development and the requireents for the operations of its embers including small and arginal farmers and local artisans. hey are registered as cooperative ocieties and the weaker sections of e farm community small and arginal farmers, agricultural bourers and rural artisans have a :cisive voice in their management. SS is expected to meet all the edit requirements of the members cluding the long-term investment edit, undertake the business of ıpplying inputs and services at asonable prices and marketing of ıe produce of its members and ovide appropriate linkages with nctional production-cum-marketg cooperatives for dairy, livestock aring and sericulture.

In addition to organisation of SS in selected areas, a national ogramme for reorganisation of e traditional primary agricultural edit societies (PACS) has been unched in different states. The reorganised PACS are expected to provide integrated services in the rural areas like provision of credit and inputs and supply of essential consumer goods. Besides, these societies will also disburse consumption loans to weaker sections of the community in pursuance of the national decision on the recommendations of the export committee on consumption credit. To meet the special needs of the tribal areas, large-sized multipurpose societies capable of providing credit-cum-marketing services and supply of essential consumer articles are also being established. So far, about 800 such societies have been organised in different states.

In 1974-75, more than 30 per cent of the total loans issued by the cooperatives in the form of working capital loan and investment credit went to the weaker sections. There is a case for a progressive step-up. The differential rate of interest scheme administered by commercial banks provides institutional finance at four per cent rate of interest to the weakest sections of the community. The scheme has a definite rural bias since not less than two-thirds of the advances under this scheme are routed through the rural and semi-urban branches of the commercial banks. Besides, not less than one-third of the advances under the scheme should flow to eligible borrowers belonging to scheduled castes and scheduled tribes. Further, government subsidies are made available for accelerating the flow of institutional credit and related facilities to small farmers.

Dairying and Village Industries

The problem of livestock raising among the small farmers through credit for supply of feed and the development of marketing is of crucial importance. The supply of credit for livestock raising should cover such diverse purposes as cultivation of fodder crops, maintaining buffer stock of fodder, development of pasture land, developing small farmers' livestock holdings and the marketing of livestock products including milk, meat, hides and skins. A dialogue between the credit experts on the one hand and the animal husbandry experts on the other would facilitate identification of the precise factors that have so far prevented credit institutions from financing livestock development on any significant scale. The fishery sector is another important area where much can be done for the welfare of the weaker sections.

Apart from development of all aspects of agriculture sector in its widest sense, the promotion of rural village industries merits special attention in the context of rural development and removal of unemployment and under-employment. Modernisation of agriculture creates a demand for new inputs and consumer goods and services such as improved agricultural implements, small pumps and motors, services of tubewell operators, mechanics etc. Rural homes need basic furniture and improved kitchen utensils. It is, therefore, essential to develop the capacity to design and manufacture simple producer goods appropriate for small scale village industries. It is also necessary to upgrade the skills and organisation of village blacksmiths, carpenters, shoe-makers, weavers, and potters. With the development of agriculture, certain categories of urban-based industries can be decentralised and located in the rural growth centres with little economic sacrifice. All these presuppose careful perspective planning and a nationally supported programme to provide inputs like credit, raw materials and equipment, electricity, training for technical skills, development of necessary rural and village industries suitable to the area and above all linkage with market centres.

Measures to improve health, education and housing for the rural poor should go hand in hand with economic well-being. A task of this magnitude calls for careful planning and policy formulation, reallocation of priorities, co-ordination of sectoral efforts for social and economic welfare, massive mobilisation of resources and, above all, a sense of dedication. Rightly, therefore, attention has been focussed on rural development at the highest level.

SPECIAL ARTICLE

Dimensions of Public Participation in Development

ANAND SARUP

PARTICIPATION IN development has to be looked at essentially from three points of view. First, in a democratic society, it creates an awareness of problems and possible solutions among the people and thereby equips them as citizens to exercise choices relevant to development in a rational manner. It also creates an atmosphere for purposeful communication and deliberation and thus starts the process of building up constructive leadership patterns at the grass roots level which are essential for the survival of democracy. To the extent such public participation is institutionalised, a stable base is created for decentralised exercise of power both on territorial and on functional basis.

Secondly, public participation is important from the viewpoint of learning about what is really happening on the ground, either as a result of market and other exogenous forces, or as a result of government sponsored activities and also about how the people are reacting to these happenings around them. Eventually, in a democratic set up, a plan or a government scheme has a chance of succeeding only if it evokes a positive response from the people On the other hand, if the people who are either affected by these or are witnesses to their implementation feel that these are unnecessary, ill-conceived or badly implemented, the whole effort will sooner or later peter out and in the bargain, bring a bad name to the government.

Thirdly, it is the people who, as users of facilities, should be taking decisions about the location, nature and quality of infrastructural facilities and social services since they are in the best position to know their requirements and the logistic conveniences. Where people have not been consulted before taking locational decisions in relation to these, there has been a tremendous incidence of underutilisation; for instance some of the industrial estates set up in the early sixties are vacant even now for want of takers.

CAMOUFLAGE OR SINCERITY?

If "public participation" is being organised only as a device to legitimise decisions already taken, it is best that measures towards this end should be made as diffused as possible around vague issues so that nothing concrete and possibly contrary to the "given decisions" can emerge. If, on the other hand, public participation is sought to be a tool for decision making, then a tremendous amount of preliminary analysis of relevant information has to be undertaken and the people have to be presented not only with specific issues and alternatives but also made aware of the limitations within which decisions will have to be taken. Public participation will yield meaningful results only if many rounds of discussion are organised at various stages of decision-making.

It is elementary that if public participation is sought as an essential input in decision-making, the senior echelons of the administrative hierarchy have to believe genuinely that, with regard to the matters on which participation is sought, they *do not already know* the correct and final answers. If this kind of humility and receptive frame of mind is not there, it is hardly fair to expect that the process will be carried out with any seriousness of purpose. In this connection, it may be relevant to point out that decision-making through public participation, whatever may be its value from the democratic or long term point of view, is more cumbersome and dilatory than arbitrary decision making at the top and, therefore, before it is started the quantum of preliminary work and educational effort required and the time dimension of the process should be reckoned with and organisational arrangements required for these iterative exercises should be built into the process of decision making. It should also be recognised that to the extent public participation in decision-making is widespread and effective, there is likely to be a strong adverse reaction in case recommendations arising out of the process are ignored in an arbitrary manner without giving convincing reasons.

WHERE FIRM DECISIONS ARE NEEDED

Planning from below has been a favourite cliche and consequently village, block and district plans have been prepared in connection with the formulation of practically every five year plan. None of these has yielded any meaningful results precisely because some of the steps indicated above were not taken Moreover, these exercises of "planning from below" have been one shot affairs in contrast to the repetitive iterative exercises which go on between the Central Planning Commission and the State Governments

It is essential because of the attitude of the departmental decision-makers at the top, that village, block and district plans end up by being no more than census operations for unco-ordinated demands which cannot even be considered within the ever present constraints of resources. Consequently, these 'plans' end up on the shelves and decisions are finally taken in total disregard of these, creating strong resentment among those who were consulted as well as those who collected and organised the information at various levels. If planning at village block or district level is to be initiated again in connection with the formulation of the sixth plan, the planners will have to reckon with tremendous resistance from all kinds of functionaries right down the line who have had an unpleasant experience in respect of these on earlier occasions.

The only chance of operationalising multi-level planning below the state level and creating motivation for taking it up seriously lies in taking firm decisions about :

(a) determining the extent to which each activity can be disaggregated;

(b) classifying various activities and their constituent components into divisible or indivisible categories with reference to different units of planning;

(c) identifying the minimum viable unit of operation for individual activities;

(d) specifying the levels at which :
   (i) final decisions will be taken ;
   (ii) general or specific recommendation will be forwarded upwards after scrutiny, correlation, analysis, and synthesis of inter-related information ;
   (iii) relevant information will be aggregated; and
   (iv) field or feedback data will be collected with reference to each area of decision-making;

(e) defining the preparatory work which will be done at various levels and the outlines which will be presented to provide a meaningful frame-work for interaction between various levels in the multi-level framework;

(f) working out the stages of the planning process at which inter-action will take place between different units of planning;

(g) predetermining the extent and the manner in which the decisions taken or recommendations made at lower levels will be subject to modification; and

(h) earmarking the resources which will be allocated for financing programmes evolved at different levels in the context of the divisibility and possibilities of disaggregation of various activities.

Other prerequisities for "planning from below" uld be :

(i) a clear conceptualisation of the process of inter-linking inter-related activities pertaining to production, infrastructure, input supply and social services at various levels,

(ii) breaking down the insularity of departmental agencies by identifying the authorities and/ or institutions who would have indisputable authority to commandeer information from them; and

(iii) providing these authorities/agencies technical support necessary for analysing and correlating this information into internally consistent and viable plans attuned to local conditions.

WIDENING BASE OF CONSULTATION

The mechanisms of participation generally consist consultation with only *some* of the participants oring others despite their crucial role with reference particular activities. Small entrepreneurs, traders, tential beneficiaries of social and tribal development programmes, representatives of professional dies, consumers and others operating in the unornised sector are seldom taken into confidence. *Anter class which has been ignored at great cost to development process is the large array of field el functionaries of various departments who could, en a proper forum and adequate protection from wrath of their superiors, come out with rare nugs of practical wisdom.*

Against a list of activities, the role of all the partiants should be spelt out and thereafter, measures consulting them at least informally, should be vised, notwithstanding the fact that final decisioniking would be organised through certain well regnised rural and urban development bodies like the nchayati raj institutions, municipal corporations, ban development authorities or block, district or isional development committees. It would be best to illustrate this point by indicating that in relation to the programmes of agriculture (especially in hill areas), water supply, gobar gas plants or rural latrines, the role of women is as important as that of men and if programmes are drawn up without consulting them, these may prove unrealistic and eventually unacceptable.

IDENTIFYING BENEFICIARY GROUPS

The operational implication of the above approach would be not to treat public as one uniform mass but to identify participant beneficiary groups for each activity and if well-established organisations do not exist for their representation, special panels to consult them should be organised at different levels and regions. In this connection the advice of progressive farmers, youth, students, teachers, women, craftsmen plying particular crafts, small scale entrepreneurs concerned with specific industries, consumers or potential beneficiaries of various infrastructural facilities and taxpayers will have to be sought, *inter alia*, regarding :

(i) the functional efficiency of ongoing activities ;
(ii) the specific measures required for further development;
(iii) the relative priorities to be assigned to alternative measures ;
(iv) the likelihood of the realisation of roles assigned to various categories of participants in a programme ;
(v) the feasibility of the extent of public participation envisaged by way of technological changes, investment of savings, allocation of material and manpower resources ; and
(vi) location of various facilities.

Not one set of schemes uniformly applicable all over the state, but a shelf of schemes pertaining to various objectives, providing for different mixes of infrastructure, inputs, technology, personnel and investment patterns, will have to be prepared to cover a large and variegated state.

People can make a contribution to the planning process only if they are presented with a well articulated and feasible framework of approaches, objectives, measures and alternatives. If, on the other hand, they are asked to indicate their needs in a vacuum, they are bound to put up a charter of demands which will be far beyond the capability of government. The correct stage to consult the people and their representative organisations therefore, is *after* adequate analysis of relevant information has been undertaken and a broad framework has been drawn up and *not* at the starting point of the planning process.

ENDING SEPARATE HIERARCHIES

In administration, people are not interested in the assignment of functions to various departments under the standing orders of the government. They look at activities or functions in their entirety and expect that their advice will be sought and acted upon by the government in an integrated fashion. People cannot make allowances for the fact that according to government's rules, separate departments take independent decisions regarding infrastructure, fiscal policies, labour regulations, technical training and supply of power and other inputs. The existing departmental barriers will, therefore, have to be lowered and the process of decision-making will have to be oriented to economic and social

functions like agricultural or industrial production, personal and social consumption and employment, rather than to arbitrary assignment of activities between departments irrespective of their functional inter-dependence. Departmental empires with their own hierarchies, vested interests and sectional outlooks have been defying the adoption of a participative approach to indivisible functions. This must end. Targets, roles, functions, projects, investment portfolios for departments dealing with economic infrastructure and supply of inputs would have to be *derived from* socio-economic objectives and targets rather than being determined independently or exogenously on the basis of the prestige and pull exercised by them.

The principal items for obtaining public participation in decision-making will relate to :

(a) the existing and projected levels of availability of consumption of various consumer durables, consumption goods, housing and social services for various sections of the population living in different regions ;

(b) production and productivity in relation to agricultural and industrial products ;

(c) augmentation and diversification of employment ;

(d) use and conservation of natural resources ;

(e) the implications of various alternative models in terms of savings, investment, allocation of material and natural resources and manpower inputs.

Once the objectives in relation to the above have been defined and quantified in the form of alternatives based on different norms of satisfaction, the concomitant requirements of infrastructure, inputs, technology, and supportive services will be worked out and presented for consideration and selection of the optimal model from the point of view of feasibility. In this connection, while representatives of the public and experts associated at the apex decision making level may contribute to the iterative back and forth exercises of harmonising alternative socio-economic objectives and the means of supporting these, the public forums at the village or block level can advise only on the locational, qualitative and operational aspects of infrastructure and other services.

Successful Implementation

Unless people legitimise a programme by accepting its desirability, the programme cannot be implemented in a democratic society. Successful implementation of most programmes also requires that people make the recommended choices in the allocation of natural and material resources, adoption of technologies, application of inputs, investment of savings and mobilisation of skills and labour resources. To ensure that the people do participate positively in accordance with plan programmes, it is essential that adequate efforts should be made for educating the persons concerned regarding the anticipated social or personal benefits of the measures proposed.

People are often averse to a high incidence of resource mobilisation, because they feel that most of the money goes into the maintenance of an ever growing army of government servants. Consequently, from time to time experiments have been tried for persuading the people to contribute directly to meet a substantial proportion of the cost of welfare projects either in cash or in kind This will have to be re-introduced since it engenders a high degree of commitment to development objectives and also, to an extent, results in the responsibility for maintenance of facilities being assumed wholly or partially by the community.

Implementation committees with public representatives as members can succeed only if policy makers and senior functionaries have an open mind about the possibility of a measure or a scheme proposed or administered by them being wholly or partly erroneous and operationally misconceived. There must be fast two-way channels of horizontal or vertical communications. Feedback information must be quickly analysed and inadequacies quickly removed.

Exclusive Jurisdiction of Panchayats

There has been a progressive erosion of the status of panchayati raj bodies, their accountability, viability and administrative authority. Narrow departmentalism and centralisation of power which was sought to be curbed through these, have reappeared The effectiveness of these bodies has also suffered considerably from their not being made squarely responsible for integrated planning and implementation with reference to even those activities which were obviously divisible and could be handled by these organisations. The position of these bodies was made even more untenable by the fact that in many States, very little power was vested in them for raising resources and at the same time practically all the money allocated to them was ear-marked for pre-determined activities, leaving little room for innovation.

Panchayati raj institutions should have more *exclusive* jurisdiction over at least a few important activities which are particularly relevant to socio-economic development within their jurisdiction. While concurrent jurisdiction in some matters is necessary, the enumeration of such activities has to be on a selective basis on objective principles so that the higher level bodies, especially state departments, which have far greater resources at their command cannot easily subvert the authority of the units at lower levels through the exercise of financial incentives and disincentives.

Crux of the Question

In many ways, the central issue needing urgent consideration relates to the financial viability and independence of various institutions with reference to the nature and quantum of responsibilities assigned to them. Either these issues will have to be sorted out or alternative forums for disaggregated decision-making at the regional, district and lower levels, will have to be created. Administrative units at the divisional or district level, by themselves or with the advice of ad hoc bodies consisting of public representatives, cannot function as instruments for mobilising meaningful public participation or effective decision making on the basis of local needs and conditions, since these stand in a position of clear subordination with reference to executive authorities at the State level

For obvious reasons, the functional or spatial units like cooperatives, banks and municipal bodies, have their own hierarchical tiers which cannot be subordinated to local advisory committees or the panchayati raj bodies This situation therefore, also poses a major problem of coordination for which no satisfactory solution has been found so far. In the interest of integrated decision-making and coordinated opera-

tion of the closely inter-linked functions assigned to these bodies, suitable measures need to be devised on a priority basis.

The crux of the question is whether there is honest intention on the part of higher authorities to decentralise decision-making and delegate specific functions to lower level units to the point of the exclusion of their own jurisdiction. Do they realise that somehow people at lower levels know more about both field problems as well as solutions and, therefore, they have to be consulted and trusted to exercise their judgment in relation to programme which affect them and the environment in which they are living ? Public participation in decision-making is essentially an aspect of functional democracy and, like other democratic processes, it is liable to error. Therefore, before the process of public participation is initiated, it is necessary that those in authority ask themselves whether they are willing to take the risks attached to democratic functioning in relation to the process of socio-economic development

RURAL DEVELOPMENT

The Challenge Can be Met

T. A Satyanarayanan

NEARLY SEVENTY per cent of our agricultural holdings are operated by small and marginal farmers, owning less than two hectares. What is worse, most of these farmers, particularly those in unirrigated areas, live below the poverty line, that is to say, they are below the minimum standard of consumption of twenty rupees a month at 1960-61 prices or thirtyseven rupees at 1971-72 prices.

With the introduction of high yielding varieties in areas of assured water supply in the mid-sixties, agricultural production has shown a significant increase. The gains from this technology are believed to have gone mostly to the richer farmer, who not only had easy access to technology, but also credit which enabled him to get higher yields per hectare. This resulted in wider disparities in rural incomes, with smaller farmers not getting their due share of the benefits of the green revolution.

This aspect was considered in the fourth plan which took up a special programme for the development of small and marginal farmers and agricultural labourers. In the wake of the recommendations of the National Commission on Agriculture, the fifth plan made some changes to make these agencies for development of such weaker sections more effective and purposeful. A similar approach was adopted for other schemes like drought-prone area programme, command area development, and tribal development programmes. However, considering the magnitude of the problem, their impact was minimal.

Apart from improved agriculture, other activities to supplement the income of small farmers and agricultural labourers and establishment of a country-wide network of small scale industry are important.

The core of the problem lies in creation of adequate employment opportunities for the rural poor. It is in this context that development of ancillary activities like dairy farming, poultry, piggery, fisheries and farm forestry assume significance. The plans for development of these activities should include not only provision of necessary inputs, but also development of organisations which will collect, store, and market the produce. Cooperatives have to be strengthened. With varying degrees of success, many of these programmes are already being implemented The all-India coordinated research programmes for improving the breeds of cattle and buffaloes have given a shot in the arm of animal husbandry and dairying. For poultry development, the government has launched a programme which provides for delivery of inputs and services in a package form, at the door of the farmer. Poultry production has also been adopted to help tribals. Special emphasis is being laid on improving the quality of inputs like breeding-stocks, feed support, health coverage and marketing.

Forestry and Fisheries

Since forests play an important role in rural and tribal economy, revision of national forestry policy is under consideration. Under social forestry programme, plantations are being raised on waste lands, panchayati lands, roads and canals.

With the declaration of an exclusive economic zone of 200 miles around our coast, the potential for fisheries development has increased. The budget for the current year has provided a three-fold increase in the outlay for fisheries development. The exploratory fisheries projects are being strengthened to chart and map out fisheries resources around the coast. Twentyfive fish farmers' development agencies are in operation in various states for intensive development of inland fisheries.

Some new initiatives taken in the current year for rural development include construction of rural roads with a budget provision of Rs. 20 crore and development of primary markets on a pilot basis. In the hill, tribal and drought-prone areas where basic facilities for proper marketing by producers are not available, regulated markets are proposed to be started.

The entire approach is to generate more employment opportunities within the framework of an area-centred programme of integrated rural development.

It must be admitted that increased productivity leading to higher income and increased opportunities is dependent on four pre-requisites : appropriate technology and its transfer to farmers , efficient input supply system including credit ; adequate processing, marketing and storage network ; and a well developed extension service

Crucial Role

While all these factors would help in increasing productivity on the farm, development and transfer of technology is a basic requirement. Since farming in the country is carried on under varying agro-climatic conditions and involves a wide range of operations and management practices, agricultural engineers have a crucial role to play in developing suitable implements. These could be manufactured by small and medium industries dotting the contryside. Processing of various agricultural produce also offers a wide scope for rural industries.

The elements going into an integrated strategy are well known

and do not require too much of sophistication to implement. We have capable scientists and technologists who can provide us the know-how and make necessary innovations. Extension has to play a vital role to ensure the transfer of technology. Its weaknesses have to be removed.

With political will, the allocation of resources may not prove a stumbling block. What we need most now appears to be a streamlined organisational structure, reaching out to the remotest areas to keep a constant watch over immunerable small details and to ensure effective implementation of the programmes. The success of rural development depends on our ability to take up this challenge. □

MAHARASHTRA NEWSLETTER

GUARANTEED EMPLOYMENT: NEW DIMENSIONS

AVINASH GODBOLE

IN PASSING a bill guaranteeing employment to every able bodied person in the rural areas, providing unemployment allowance of one rupee per day to those whom the government would not be able to provide such employment, the Maharashtra government has partially implemented the constitutional provision that citizens be given the right to work—partially because the provisions of the bill are applicable to rural areas only. The act places on the Statute book the Employment Guarantee Scheme (EGS) which has been in operation for three years in the state. But unlike the original scheme, the act casts on the government, a statutory obligation to provide jobs in rural areas within 15 days of demand.

Under the new act, all adults over the age of 18 in rural areas (including 'C' class municipal areas) in the state who volunteer to do unskilled work will be provided with jobs, in works which will bring into being durable assets for the benefit of the community and the economy as a whole. While providing jobs, care will be taken to see that the normal agricultural operations do not suffer because of the drafting of persons for works under the scheme. An attempt will also be made to give continuous employment in cottage, village and small industries and also in agro-industries.

The jobs provided will be generally within a panchayat samiti area as far as possible but in any case not more than five kms. away from the place of the residence. Every employed person under the scheme will be paid three rupees per day. It will cost the government about Rs. 72 crore a year. Inclusive of unemployment allowance, in cases where jobs cannot be provided, the government expects a total annual expenditure of the order of Rs. 82 crore in a full year.

To provide funds for scheme, the government has introduced professional tax on a slab system for the past three years from which about Rs. 25 crore are expected to be collected annually. In addition to this, the government intends to set up an employment guarantee fund to which the proceeds of the professional tax will be credited and the government will give matching grants from the general exchequer. A portion of the fund will be used to educate the urban unemployed and give them opportunities for self-employment.

Under the act, there is a provision for registration of those who want work. The registration will be done at the village level by the VLW or *talathi*. Once a person registers his name, the state will be under obligation to provide him work within 15 days of the registration and if the government is unable to do that, the person will be entitled to unemployment allowance as provided in the act, till the government gives him work.

The act also provides for medical help and compensation for those persons who may be ailing or who may suffer injuries while on duty. □

HSCL'S ACHIEVEMENT

DR. R. P. VERMA

TO DEVELOP indigenous expertise and construction know-how for steel plants in particular and other spheres of construction activities in general, Hindustan Steel Works Construction Limited was established in 1964. Bokaro was its first assignment. The progress of construction has been a story of steady, hard and dedicated work. Towering structures and chimneys now dominate its skyline. Construction work began in October, 1965 and as of today a large number of its units have gone into production.

The growth of self-reliance has been quite spectacular in respect of equipment and materials supplied for the plant. Most of the structures required for the first stage of Bokaro were fabricated indigenously. In the second stage for trial all structures will be indigenous. This is in striking contrast to the position in Bhilai where nearly 80 per cent equipment of the first stage and 77 per cent in the second stage was imported The Heavy Engineering Corporation are the principal manufacturers of these heavy but highly complicated and sophisticated equipment. Mining and Allied Machinery Corporation have supplied conveyors which have been extensively used in this plant for the mechanical materials handling system SAIL supplied heavy electrical equipment, valves, and motors. Instrumentation Limited. Kota, have also had a big share in the supply of equipment. All the public sector undertakings shared between themselves 53 per cent of the total indigenous supplies of machinery and equipment for the first stage and this proportion has further increased during the second stage of the plant.

The effort to develop indigenous construction know-how got a further fillip with the government's decision to expand Bhilai's capacity to four million tonnes to set up three new plants at Salem, Visakhapatnam and Vijayanagar. HSCL are engaged in the construction and expansion of all public sector steel plants including Rourkela, Durgapur and TISCO's plant at Burnpur It has a large network of construction projects spread over 40 units in nearly 30 towns.

HSCL today have skilled manpower of over 21,000 people including engineers, supervisors, technicians and managers in all the disciplines of management.

.et Us Not be Taken for a Ride

SUMITRA KULKARNI

A FEW days ago it was reported that the steel ministry was proposing to set up three gigantic steel mills with a total capacity of 30 million tonnes at a cost of $ 6,000 million each. All this steel is to be produced for export purposes, and due to paucity of resources in the country, foreign parties have shown willingness to bear the entire expenses for the erection of such gigantic steel plants. Since then the steel ministry has also announced that such a proposal is under consideration

Steel is a key industry and such a vast foreign private investment in this sector naturally raises a number of basic issues

According to the industrial policy resolution of 1956 steel is reserved for the public sector and only the government can control and own the steel industry. With this proposed foreign private investment, steel industry can no longer be considered to be purely on the public sector. Whoever invests also owns and whosoever owns also controls the management. Therefore, it is logical to assume that with this proposal of accepting foreign investment, the spirit of the industrial policy resolution of 1956 will be modified. If any change in that policy resolution has to be brought about it is necessary that there should be a public discussion of all its implications. This is an issue of great importance. In view of this proposal, which is yet in an embryonic stage, the government should bring a fresh resolution before the Parliament and to deliberate on it in detail. After it is duly debated and amended and adopted by Parliament, then only can government finally commit itself to any private party and particularly foreign investors.

Presently, there is a glut of steel in the world market and the price of steel has gone down. In fact, most of the steel-producing countries are cutting down their investment and reducing their steel production. Because of such world trends, India has inadvertently got a morale booster in that it has become the most largest producer of steel in the world. Other major steel producing countries are no longer adding on to their production.

IMPLICATIONS OF REMITTANCES

Today India produces seven million tonnes of steel and even that we are not able to consume and we are forced to sell it in the world market at uneconomic prices. In the face of such global trends, the question is, "Should we produce at all so much of steel and if we do, where are we going to sell all this 30 million tonnes and who are going to be the buyers"? Report has it that the foreign investment will ensure the export of these 30 million tonnes and we will earn more foreign exchange. One wishes one could believe the fairy tale. Nobody invests for love of any country or its people. If hard earned dollars are to be invested, then it is reasonable to expect that at least 25 per cent net profit is being planned after paying the taxes which, if added, will work out to 50 per cent profit. In other words, out of $ 18,000 million investment, this country should be prepared to allow $ 9,000 million profit to be remitted in one form or the other every year. Unless some such clear cut return is available, no foreigner, with all his altruistic talk, is likely to invest his precious money. Therefore, it is necessary that the government should examine the implications of such remittances.

Recently in the Rajya Sabha the Industries Minister said that, on the lines of the Kudremukh iron ore project, these projects will also pay for themselves. Unfortunately, the example of Kudremukh is not a very happy one to mention. The gross foreign exchange earnings of Kudremukh will no doubt be impressive. But from these earnings the country has to pay the foreign investors, the foreign technicians and the American and the Canadian contractors who are working at these mines. After these deductions, very little profit is left for the country. This is not worth the effort. In fact the country is selling its precious iron ore in the Konkan for a song. This amounts to exploitation of cheap labour and our natural resources by foreign capital. I am sure that none in Janata government wants such a thing to happen. But, if they are not very, very cautions, it is bound to happen. In the world business forums, our bureaucratic negotiators are still pretty naive and have not yet mastered the art of striking profitable bargains for our country. The bureaucrat still looks down upon trade as something not quite prestigious and, therefore, does not really master its intricacies.

ONCE BITTEN, TWICE SHY

Again, if the story about the hundred per cent export can be believed, it will be necessary that the steel ministry persuades these benevolent foreign investors to enter into long term purchase contracts duly backed by a bank guarantee or underwritten by the country of the investors. Our country has had sad experience of a scooter project where exports where guaranteed. In those days of early 1972 there was tremendous euphoria about this project and some members of Parliament from the state, in their excitement, hoped to see every farmer in Uttar Pradesh going to his field cn a scooter. It was also believed that scooters made in India would be seen on the express ways of the countries of European Economic Community. Today this famous project is very much a sick concern. Nobody speaks of its exports. Besides, such an obsolete plant was palmed off to India that whatever is produced keeps coming apart and the cost of production is exorbitant. It is not very unlikely if some clever steel magnate is also planning a similar strategy to dump some scrap steel mills on an eager but naive developing country like India. These are serious pitfalls and no amount of precaution will be too much. It is to be hoped our steel ministry experts are alive to these aspects.

WE HAVE THE EXPERTISE

For putting up a steel plant four capabilities are needed: designing, fabrication, erection and commissioning. Though some hyper critical persons may not believe it, we have capabilities in each of these areas. For the last 10 years, our countrymen are being assured that we have mastered steel technology and this country can set up any type of steel mill without foreign expertise or knowhow. In view of this, one is tempted to ask why we go in for this foreign investment after 30 years of independence and ten years of experience in steel? There is abun-

dance of coal and iron and unlimited labour and the country has a whole range of skilled technicians and experts in steel engineering. The value adding operations on these basic natural resources of this country, can surely be done by our own countrymen with our own capital. It is they who should have the opportunity to benefit from such heavy investment and certainly the credit should not be allowed to be taken away by alien experts and investors.

After all what is wealth but accumulated labour. We have resources and we have labour and the required knowhow. If we still prefer to go out of our way and allow foreigners to set up steel mills in our country, surely it will demoralise our steel experts. In fact it appears ridiculous that an Indian company takes up a turnkey project worth over Rs. 1,000 crore for a steel mill to be set up in Libiya and we look to foreign experts and investors instead of using our own engineers and consulting abilities !

We have all the infrastructure and equipment needed for steel plants. The Heavy Engineering Corporation at Ranchi and the Heavy Plates and Vessels at Visakhapatnam are exclusively meant for steel industry. Both these corporations have idle capacity. We can easily ask these corporations to swing in and set up these 40 million tonne gigantic mills, and at any rate with good management they can produce steel at much more reasonable rates than what these foreigners will do. Instead of using the expensive foreign capital we should plan to maximise our foreign exchange earnings by using our own resources.

Serious Imbalance

The theory of paucity of resources cannot hold water. For any worthwhile economic project, there is never any shortage of financial resources. The World Bank gives the softest loans for industrial development in rural areas of the developing countries. If there is need, money can be raised on the stock exchanges of New York, London and Tokyo and I am quite sure it will be duly subscribed. But to allow foreign private investment in such a basic industry is fraught with untold dangers and before the government takes a plunge it will be wise to tread warily with these international monetary sharks.

I have a serious suspicion that even $ 18,000 million will be inadequate. Roughly $ 600 million is the minimum investment needed for a one million tonne steel plant. Today Bokaro's 1.7 million tonne steel plant has cost the country over $ 1,200 million. In the light of this experience, it is difficult to believe that 30 million tonne plants could be set up during the next seven years for only $ 18,000 million. It is more likely to be of the order of $ 25,000 to 30,000 million. Should the country go in for such ventures at such cost ? If I am not mistaken, the sixth plan outlay may not exceed Rs. 60,000 crore. In that case half the plan will be nothing but steel. The next question is, "Should government allow such imbalance, particularly when the government desires to ensure supply of drinking water and improve irrigation and start shipyards and launch schemes to eradicate illiteracy and unemployment in the next 10 years ?" ☐

Need For Social Entrepreneurs

Pran Nath Luthra

THE YEAR 2000 A.D. is not far away. Do the social welfarists dread it, welcome it or have no feelings about it ?

Statistics on social welfare are sadly lacking. It was only in 1975 that the Government of India produced its first ever publication on social welfare statistics. Indications are that the problems have outstripped the remedial efforts. The number of beggars is now placed at over a million, double what it was a decade ago. The number of unemployed has been steadily burgeoning over the years. The earlier estimate of the handicapped was 10 per cent of the population and has now been revised upwards to 15 per cent. Crime has shown continuing expansion while the total of those below the poverty line has shot up from an earlier 40 per cent to 60 per cent of the population. These are indicators of a situation where the malady appears to be beyond the control of its doctors.

It is often asserted, with some truth, that, in absolute times, the progress has been devoured by the exploding population. But it does little credit to the nation's planners that had not taken into account the rate of population growth. It is their duty to discover and find adequate resources to match the expanding population. And as for resources, indigenous and outside, it cannot be said we had or have reached the limits of growth. What then is the reason why we face appalling poverty and degeneration of human dignity, where children are abandoned to become destitute, girls are kidnapped for immoral traffic, the sick, old and the idle turn into beggars or that the healthy and agile choose crime as their mainstay of life ?

Possible remedies are that Government's contribution towards social welfare has to be made more substantial and the basic concept of social welfare should be radically changed from one of relief and succour for the weak and disabled to their development towards self-dependence.

Stereotyped Grooves

It is customary in this industrial civilisation to talk about entrepreneurs. They are self-appointed adventurers who strike out in new fields of industrial manufacture to enhance production and employment. As an association, the entrepreneurs are ceaselessly engaged in discovering fresh possibilities of utilising raw materials with varying technology to meet the needs of the market for goods. If the year 2000 A.D. has to witness less want and suffering among human beings, then it seems necessary that a new class of "social entrepreneurs" should emerge as a matter of urgency. The social entrepreneurs will be concerned with surveying and scrutinising the prevailing syndrome of distress and disability and fashioning social technology to meet the challenge of such distress.

It appears that social workers and the voluntary sector of social welfare has got bogged down in stereotyped grooves. The methodology adopted for treating a situation of 'illfare' is primarily based on providing relief. Distribution of nutrition is an example which only conditions the poor to outside aid. Similarly, the opening of clinics or schools by leaders from outside the world of the needy goes to encourage dependence.

If, in the past, governmental or voluntary efforts have failed to develop the indigent and backward communities, it is because the

leadership was external, resources for a scheme were imported and not developed internally and the schemes were not planned by the needy people. The major lesson of past experience is that development must be planned, executed and achieved by the needy communities themselves. In the decades to come, a radical departure must be made from the prevailing methodology of designing welfare schemes. This was the basic message of Gandhiji who once, when approached by zealous rural social workers, remarked "Don't ask me what to do in the villages; ask the villagers". It is ironically true that with the present shape and purpose of welfare schemes, the authorities and the voluntary agencies achieve what they do not aim at, namely, people's dependence on the *sarkar* or the elite.

And it is not enough to re-orient the draughtsmen of welfare schemes; we have to consider a basic change in the existing system of ownership or control of production that provides the inputs for the poor. The poor agriculturists must not only have land but also a share in the means that produce pesticides, fertilisers or irrigation. The present dichotomy which places the possession of agricultural industry in the hands of urbanites with the agriculturists heavily and perennially dependent on them, is not a pattern conducive to the eradication of poverty. This calls for a major economic change to promote a social change among the needy.

For too long, too many types of healers of social ills have paraded their distinct labels as rural workers, health workers, social workers and the like. It is time they were imbued with a common purpose and a common effort to achieve a common goal. And the goal is not relief or charity for the poor but a developmental one, namely, to help a poor community to develop its own dynamism against its inadequacies. ☐

I have little patience with scientists who take a board of wood, look for its thinnest part and drill a great number of holes where drilling is easy.

—Albert Einstein

NUTRITIONAL FOOD

AVAILABILITY AND PURCHASING POWER

S. C. TRIPATHY

THE PROJECTIONS worked out by an expert committee set up by the Planning Commission, indicate that India's population is likely to reach 695 million by 1981 and 750 million in 1986. The estimated annual foodgrain requirements by 1981 are placed at around 167 million tonnes as against the present annual foodgrains production of around 110 million tonnes, on an average. The increase of food production by addition to the area under cultivation seems to be no longer possible. The answer lies in intensive and scientific agriculture.

This has been the strategy in the fifth plan, especially in the command irrigated area. The growth in the gross cropped area which in the recent past has been around 1.2 million hectares per annum is sought to be nearly doubled during the fifth plan, so as to add nearly 11 million hectares by the end of the plan. In most crops the growth in production is expected to come from growth in the productivity of land by about three per cent a year. Besides improved crop management including more efficient use of valuable inputs like water and fertilisers, a massive programme of integrated area development particularly in the rainfed and drought prone area, is also visualised. The various measures to subserve these objectives, seek to ensure that the rural poor are enabled, through their larger involvement in the development programmes, to raise their standard of living.

Between 1955 and 1965 the net availability of cereals went up by 20 million tonnes, an increase of 46 per cent. But the per capita availability went up only by 10.6 per cent because, in the meantime, the population had shot up by about 25 per cent. And in the case of pulses, a rich source of proteins, the per capita availability came down despite an increase in production. The per capita availability however increased in subsequent years to 498.5 grams in 1974. But this does not reflect the minimum nutritional level of different segments of the people.

Food supplies are inadequate in our country—both quantitatively and qualitatively. In Indian diets there is a preponderance of the consumption of cereals and pulses. Out of 2,016 calories available on an average in the daily diets, cereals provide 1,346 calories, pulses and nuts 216 calories and the remaining comes from sugar, gur, oils, fruits, vegetables, eggs, fish and meat. The total protein supply required per day is about 51.5 grams. The diets in India are mainly deficient in proteins, iron and vitamin 'A' and, due to these deficiencies, the children are most prone to diseases.

FACTORS OF MALNUTRITION

The all-India rural credit survey 1962-63 carried out by the National Council of Applied Economic Research pointed out that about 31 per cent of the rural families are quite poor and are not in a position to have the necessary purchasing power for consuming the requisite quantities of food, needed for a balanced diet. This results in partial starvation. Certain other factors pertaining to inhibitions in the use of nutritive, yet cheap, foods like pulses and green leafy vegetables also come in the way of consumption of a balanced diet. The illiteracy among the rural poor and lack of proper knowledge of nutrition and balanced food among both the rural and urban women is another factor. Considerable losses in the nutritive value of foods occur in cooking and preparation of foods. Then there are problems of under-nutrition and mal-nutrition.

It is estimated that about 15,000 children go blind every year owing to chronic deficiency of vitamin 'A'. On the other hand the diet deficiency in respect of vitamin 'B' causes infantile beri-beri. Vitamin 'C' deficiency gives rise to bleeding of gums, lack of power of resistance and healing of wounds. Rickets a well-known disease is said to be a direct result of vitamin 'D' deficiency. The deficiency of iron and that of calcium, iodine are said to be causative factors for diseases like anaemia, deformation of bones and teeth, and goitre.

It is only in the fourth plan that a systematic attempt started to be made for formulating an integrated nutrition programme with an outlay of Rs. 60 crore. A mid-day meal programme has been introduced for school children and it is estimated that about 15 million children had benefited from this programme by 1971. About 6,000 'balwadis' are carrying out a programme of feeding about two lakh pre-school children. The Ministry of Health and Family Planning has introduced skimmed milk feeding programme through maternity and child health centres and this programme is estimated to cover about five lakh children in the age group of 0-3 years.

During 1970-71 under the Department of Social Welfare a sum of Rs. four crore was provided for feeding one million school children in tribal blocks, and an additional Rs. four crore was earmarked for feeding one million pre-school children in urban slum areas At the village level under the applied nutrition programme, production of protective food like milk, vegetables, fruits, poultry and fisheries is being encouraged.

This is good so far as it goes from a long term point of view, the problem is to increase the purchasing power of the people so that they can afford a balanced diet. It is here that the development of agriculture and industry with close linkages between the two becomes relevant. A suitable mechanism for distribution of food commodities has to be devised so that the minimum of essential food ingredients is made availabe at subsidised rates to all according to the life style of the people. Emphasis needs to be placed on nutrition education.

Requirement of nutritious food for various age-groups in terms of calories is given below

(1) For Children: Age Group

0—6 months	120 calories per kg body weight
7—12 ,,	100 calories per kg body weight
2 to 3 years	1200 calories
4 to 6 ,,	1500 ,,
7 to 9 ,,	1800 ,,
10 to 12 ,,	2100 ,,

(2) For Women

i) doing little work in house 1900+300 if pregnant

ii) doing moderate work in house 2200+300 if pregnant

iii) doing heavy work in house/outdoor 3000+300 if pregnant

iv) in lactation period +700 calories in each category

(3) Men

doing little work in house/outdoor 2400 calories

moderate work in house/outdoor 2800 calories

doing heavy work in house/outdoor 3900 calories

LOCAL CONDITIONS

In India, owing to varying food habits, conventional types of protective foods based on local crop patterns will have to be relied upon and parboiling of rice should be popularised. There has to be a crash programme of fruit and vegetable growing in different regions so that, people with low purchasing power are able to include fruits and fresh vegetables in their diets.

Measures for population control through voluntary means, increase of farm output, and development of subsidiary and small industries in the rural areas particularly in the slack season will help in creating the availability of balanced foods.

The feeding programmes of pre-school and school children need to be enlarged and streamlined and their coverage extended.

Once the standard of living of the vast majority of our population is given the necessary push from below through a massive effort of integrated agricultural and industrialised growth, with accent on decentralisation, the nutrition problem will be overcome.

Possibilities of Clove Growing in India

DR. C. K. GEORGE

CLOVE IS the second most important spice of the world, the first being black pepper. Tanzania, Malagasy Republic, Indonesia and Sri Lanka are the major clove producing countries. During 1973, the world export of clove was about 17,430 tonnes. The largest consumer of clove is Indonesia which in addition to its production of 15,000 tonnes imported about 14,270 tonnes in the year 1973. Clove is utilised in Indonesia for the production of *Kretek* Cigarettes, the most favourite cigarette of Indonesian smokers.

In India this spice was introduced around 1800 by the East India Company in their "spice garden" at Courtallam in Tamil Nadu. Having found it possible to grow in Courtallam, it was planted at Burliar in Nilgiris, southern region of erstwhile Travancore State and the slopes of the western ghats of the old Cochin State during the period after 1850. However, there was no further extension of the area under clove over a long spell. There was also a feeling among the growers and agricultural experts that clove cultivation is an onerous job and it cannot be spread in large areas because of its exacting climatic requirements. This has been proved to be wrong and cultivation is gaining momentum in parts of Tamil Nadu, Kerala and Karnataka. The important clove-growing areas now are Nilgiris, Tirunelveli and Kanyakumari districts of Tamil Nadu, Calicut, Kottayam, Quilon and Trivandrum districts of Kerala and South Kanara district of Karnataka No official estimate on the area and production of clove is available.

Since clove production in the country is insufficient to meet the internal demand, substantial quantities of clove were being imported in the past. The highest quantity of 4,645 tonnes was imported in the year 1950-51. Thereafter the import was reduced every year by imposing restrictions. During 1975-76, only 17.5 tonnes of clove were purchased by the country.

The internal price of clove shot up substantially as the import was reduced drastically. The present price of clove in the international market is only about Rs. 60 to 80 per kg while in India it is nearly Rs. 200 for the same quantity. Due to the wide difference between the internal and international prices, there are reports that clove is smuggled into our country from Sri Lanka and Singapore. Moreover, unscrupulous traders mix spent clove along with good quality clove to earn more profit. Spent clove is the one from which oil is extracted, but it has the normal appearance of clove.

CLIMATIC CONDITIONS

Clove can be grown successfully under our climatic conditions. Although deep forest soils with high humus content is the best for clove cultivation, it can be grown satis-

factorily on laterite soil and clay [illegible]ms [illegible] dr[illegible] [illegible]rib[illegible] 150 to 250 [illegible] every [illegible] growth.

Clove can be cultivated from the sea level up to an altitude of 900 [illegible] but it prefers forest areas [illegible] an elevation of 700 to 900 metres above MSL. From preliminary studies, it is noticed that clove can be grown profitably as an inter-crop in selected arecanut and coconut gardens. Since clove requires shade, it grows well in these gardens. The fragile stem and branches of the tree are protected from heavy wind by the grown up coconut and arecanut trees.

The method of propagation of clove is through seeds. Since the viability of the seeds is only for a short period after harvest, they should be sown in the nursery immediately after collection from the tree. Seedlings of one and a half to two years old are ideal for planting. However, height is more important in selecting seedling for planting. It is found that seedlings of about 30 to 40 cm. height establish easily in the main field than smaller sized seedlings. The spacing adopted for planting is about six metres both ways. Irrigation is provided in the initial stages for early establishment and fast growth. Although the trees can survive without irrigation, it is advantageous to irrigate even grown up trees for proper growth and good yield.

The trees come to bearing in the 7th year of planting. Under ideal conditions, it may give the first harvest even at the age of five years. However, full bearing is achieved only after about 15 to 20 years. The harvesting season is spread out from September to January depending upon the altitude of the garden. A well maintained full grown tree under favourable conditions may give four to eight kg dried buds. The average yield at the 15th year and onwards may be taken as two kg per tree or 500 kg per hectare per annum under normal conditions.

Clove has numerous uses as it is highly aromatic, possesses fine flavour and imparts warming qualities. It is used as a culinary spice in all Indian homes. Cloves both whole and ground are used in baked foods, cakes, confectionary and puddings. Because of its stimulating properties, it is one of the ingredients of betel-nut chew. In Indonesia, large quantities of cloves are consumed by the tobacco industry for the production of special cigarettes. Approximately half of the world production of clove goes to the cigarette industry in Indonesia.

The clove tree is rich in essential oil. Yield of oil obtained through steam distillation is about 16 per cent from clove buds, four to six per cent from clove stems and two per cent from clove leaves. These essential oils are used in perfumes to flavour soaps, as an ingredient of tooth pastes and mouth washes, in medicine to aid digestion, to relieve toothache and for their antiseptic action. All the three types of oils contain about 80 to 92 per cent eugenol which is the starting material in one of the methods for manufacturing vanilla substitute.

Cultivation of clove is highly profitable in India now, because of the high price for the produce. The estimated expenditure in bringing one hectare of clove garden up to its 15th year is roughly Rs. 50,000. The annual maintenance expenditure after the garden has reached full bearing stage is about Rs. 3,500. Since one hectare of clove garden yields about 500 kg dried clove buds, the estimated gross income is around Rs. 1,00,000 at the current market price.

Even though cultivation of clove is highly profitable, large areas could not be brought under the crop. The main bottlenecks for developing clove cultivation are non-availability of quality seedlings, long pre-bearing period, proper care and attention required for young seedlings and lack of scientific knowledge on the culture of the crop. To meet the demand for planting material the state governments of Tamil Nadu and Kerala have a few nurseries established in their progeny orchards or district agricultural farms. The seedling production from these nurseries is quite inadequate and farmers largely depend upon the private nurserymen for their requirements. It is reported that the price of one seedling in a private nursery depending upon its age and size varies from Rs. 10 to 25. This is an exorbitant price and the farmers find it difficult to plant large areas as the investment on the planting material is quite high.

Development Schemes

In order to supplement the efforts of the state governments and improve the availability of quality clove seedlings, a centrally sponsored scheme has been sanctioned for implementation in Tamil Nadu, Kerala and Karnataka. It aims to produce 250,000 clove seedlings and distribute [illegible] rate of one rupee per seedling. The scheme will be implemented through the state departments of agriculture/horticulture.

The Tamil Nadu gove[illegible] considering a scheme for [illegible]lopment of clove in Kan[illegible] and Nilgiris districts with financial help from the agricultural finance development corporation. The physical targets fixed for the two districts is 200 and 300 acres respectively. The government has already sanctioned a scheme for clove cultivation which is being implemented by the forest department under the western ghats development programme. The idea is to raise clove in 100 hectares in the forest areas of Kanyakumari district. In Kerala, the cooperative central land mortgage bank is sponsoring a scheme to give financial help to the growers in the form of long term loans to cultivate clove and nutmeg in 200 hectares in Meenachil and Kanjirappally taluks of Kottayam district.

So far no research in clove cultivation has been done in the country in a systematic way. Although a few schemes mainly on the vegetative propagation of clove were undertaken to reduce the pre-bearing age and to guarantee the performance of planting materials, no method could be standardised. Absence of suitable method for vegetative propagation and limited range of genetic variability are the main lacunae in the improvement of the crop. The Indian Council of Agricultural Research has taken note of the dearth of information on scientific cultivation of clove and other spices and has recently established a full-fledged research station for spices at Calicut.

Clove cultivation in India is in its infant stage. As its cultivation is highly paying and suitable areas are available for its expansion in the southern states and on the Andaman and Nicobar islands, cultivation will catch up fast. Moreover, the farmers are aware of the advantage of clove cultivation and are eager to plant more and more areas. □

Yojana Quiz

1. The International Astronomical Union at a meeting ımed seven lunar craters after Indian scientists. Who are ose distinguished scientists.

2. In 1921 Star of East Film Co. produced the first picture South India. What was the name of the film?

3. Who was Prime Minister of India from 27th May to th June, 1964?

4. The longest mountain system in the world is :

   (a) Himalayas

   (b) Andes

   (c) Pyrenees.

5. How many rooms, chapels and halls are there in the alace at Vatican city, which is the largest place in the world?

6 What does Encyclopaedia mean?

7. How much water is there in the sea?

ANSWERS :

1. Homi J. Bhabha, Jagadish Chandra Bose, Anil Kumar Das, S. K. Mitra, C. V. Raman, Meghnad Saha and Vikram Sarabhai.

2. Bhishma Pratigya.

3. Gulzarilal Nanda (Care-taker Government).

4. Andes.

5. 1,400.

6. En means in, and is added to make the word stronger. Encyclopaedia comes from the Greek word cyclos, a circle and tells us that the book is not only about one thing only, bu goes all the way round knowledge. Last part of the word i English from a Greek word paidea, which means teaching o instructions.

7. The scientists who went on the challenger expedition o 1872—1876 estimated the amount of water in the sea a 323,722,000 cubic miles

BOOKS

District Management

District Administration-A Survey of Reorganisation *by Ishwar Dayal, Kuldeep Mathur and Mohit Bhattacharya. The Macmillan Company of India Ltd.*, 1976; *Pages* 91; *Price Rs.* 30.

DISTRICT administration is the backbone of India's administrative machinery. The book under discussion traces the administrative dysfunctionalities extant in an IADP district in India. It is claimed that the study is an attempt to delineate the various sub-operating systems and their *inter se* linkages, and to find out the nature of transaction with their external environment.

Chapter 2 presents a historical view of district administration. From colonial days to the present, the collector has been the kingpin at the district even though his relative roles have changed from revenue collection to that of a coordinator. His functions are numerous and of late he has to monitor such diverse information, that functional overlap between several departments has become quite common A clear-cut accountability system has yet to be evolved At present the total needs of the villagers are poorly served because for the most of the time the departments are busy sending reports to higher ups. Our reporting system has been designed more for record and less for managerial control purposes. The administrative spectrum gives an interesting portrayal of the linkages in the hierarchical system under various departments. Weakening control of BDOs and overlapping control of the elected, and the administrative systems at the block level are also highlighted in the book.

In chapter, 3, the authors give an alternative design for district administration. Here they question the very rationale behind the existing organisational arrangements. As it is, the task of creating a work team at district level has been almost self-defeating. Using socio-technical systems approach, it is suggested that the structure of the work organisation should be made consistent with the requirements of the task The work needs to be divided for administrative convenience into manageable sub-units. The nature of work (technology), determines the type of social organisation required for the job done " . . the administrator cannot achieve results unless he is able to manipulate the variables that are critical to the performance of the task" (p. 48). District management constitutes three sub-systems; production tasks, ministration tasks and protection tasks. Each of the sub-systems would need control over what is labelled, the import-conversion-export functions. For implementing the new system, there is need for liberal budgetary systems for local authorities, greater autonomy to district officers and a conscious attempt to define roles and relationships between the representative and the administrator at the grass-root level. It is observed that the upward shift or authority from district to state department should be checked and experienced hands be posted as district collectors so that better overall coordination could be achieved.

The book has brought into sharp focus the many functional disharmonies that pervade in the lower rungs of our district administration. The dualistic tern of evolving policy decisions at the one end its implementation at different levels leads to ind rence as these are not routed through the same lin command The district collector sits around a n of half-baked data sets presented by several dysf tionalities, which serve little purpose. "The dep mental functionaries look for their rewards beyond district collectorate, and the directorate in the S Government indeed function as if they were dire responsible for the performance of the functional in the field" (p 48). In brief, the intricacies invo in district management and invisible forces at w therein have been brought to the fore in the book admirable clarity and competence. Three append given at the end add lustre to the narration of adm trative cobwebs On the whole, it is a refreshing p of work Administrators and students will find useful to understand and appreciate the issues invo in district management.

—N. Moh

Manpower Planning

Unemployment and Employment Policy in India *by Jitendra Dholakia, Published by Sterling Publis Pvt Ltd AB/9 Safdarjang Enclave, New Delhi-110 Pages 78, Price Rs 20*

YOU can lead a horse to the water, but you c make him drink Well, that is what has happ to the unemployment problem, Inspite of massive vestments both in public and private sectors, the h malady of unemployment has been like a knife p ing at the heart of the people It is puzzling that volume of unemployment instead of decreasing has increasing throughout the planning period. Altho the term "unemployment" is normally applied those without work, we cannot ignore cases w employment is only partial, resulting in under-emp ment.

Because of the substantial volume of unutilise under-utilised labour, the large section of our wo population in both urban and rural areas subsist income which is neither continuous nor adequate only this, the unemployed and under-employed India are a burden on their families and relatives generally belong to the acute poverty ridden s groups This indicates that there is a certain kin social fund which takes care of the unemploye which no contribution is made by the affluent sec of the society. But, social justice demands that responsibility of the unemployed and under-empl from poor families is taken up jointly by the Gov ment and the richer sections of the society.

Moreover according to Mr. Dholakia in a la surplus country, like India economic planning necessarily be employment-oriented. He has an ed in his book the various criteria for assessing employment, the modus operandi of employment-o tation of planning in India, the approach of expert estimates of unemployment and the causes of un loyment in the rural and urban areas. He has also plained the paradox of positive rate of growth ass ed with rising rate of unemployment in India He a that in the Indian economy, planning for full em ment would require planning for investment, tech change and generation of output.

The author emphasises that only by ending paradox of unwanted men and unfinished tasks economic development, can one hope to make a in the problem of unemployment. The book

tends that the economic development plans in India can be made more employment-oriented by changing the product-mix and technique of production. Product development and innovative assimilation can contribute significantly to maximise employment effects of investments. There is need to develop an optimal employment-intensive technology. Employment-creation can also be done by means of a massive programme of rural works. Budgetary creation of employment and rationing of jobs in accordance with the criterion of poverty or income could be integrated into the overall strategy of planning for employment and growth

The author has also made a study of specific programmes for promoting productive employment in the rural and urban areas and the various constraints of a partially planned economy in India. The data on employment and unemployment among the alumni of the Gujarat University, job performances of the graduates and vocational aspirations of the students provides some valuable guidelines for manpower and educational planning. Considering the size of the book and its get up, the price is indeed high. Perhaps, this is how things are in the publishing trade.

—**Nitish S. Rele**

What Ails Our Economy ?

Readings in Applied Economics *by N.C. Joshi; Published by Vivek Publishing Company, Delhi*-110007, *Pages* 272; *Price Rs.* 48.

THIS book as the author observes in the preface discusses certain critical issues relating to economic problems of developing countries with particular reference to India. An attempt is made to present current economic problems in their 'proper perspective' and the author believes that if proper approach towards their solution is developed, half the battle would be already won

The book is divided into nine chapters besides four appendices and tables some of which could well have been incorporated in the main text, if only, to improve the statistical support to the analyses and observations noted in the book The students, however, will find the appendices particularly useful. The first three chapters including the introduction cover the general aspects of development such as economic growth, regional approach, manpower planning, project evaluation, structural and sectoral aspects, poverty and incomes policy The next four chapters deal with agriculture, industry, infrastructure (mainly money and banking) and rural development. In the last two chapters, the author reverts to the problems of macro-economic planning and development including finances for the plans, inflation, pricing, external trade and evaluation of foreign aid There is some overlapping in the matter presented in the chapters.

If this book is intended to provide supplementary material for students of applied economics, the author succeeds in good measure. Prof. Joshi's writings on present day economic problems are generally the envy of good economic journalese However, in presenting the discussions that are easy on mind, one wishes that he had given a more detailed analysis of the specific problems. In compressing wide array of facts the simple need of presenting conclusive evidence is some times overshot and observations which are of immediate policy and operational significance tend to be obscured. Such instances, for example, are noticed in the treatment of project evaluation, particularly with reference to the much debated and also much abused use of 'shadow' prices, the 'core' cost concepts mentioned in the chapter on industry, the confusing relationship between profits and efficiency in the pricing policy of public enterprises, where again the shadow price concept creeps in without anyone being wiser about the makeup. To an extent, such situations are perhaps unavoidable especially while presenting 'impressionalistic analysis' as the author himself acknowledges.

Planners and Planning Economists have not been spared by the author when he observes that they have generally concerned themselves with the immediate issues arising from the formulation of bold plans rather than with the basic problems of the economy. A dichotomy between large scale and small scale sectors was created on wrong premises without any evidence to relate alternate paths of industrial process to growth of agriculture, employment and development of backwards areas. A plea for redefinition of industrial priorities is advanced as also that industrialisation should be more directly related to welfare and employment—features of the new planning strategy which are even now being warmly debated. The argument however stops there without indicating the further steps considered necessary to achieve such ends or to evaluate existing measures and their inadequacies. Even so, the facts and views presented in this volume are of interest to students and economic administrators alike.

Women in Construction Works

Women Construction Workers *by G. P. Sinha and S. N Ranade. Published by Allied Publishers, New Delhi, Pages* 92, *Price Rs.* 10.

THE Book under review carries the findings of two studies on women construction workers undertaken in Delhi and Bihar in 1975 The Delhi exploratory survey includes 150 women construction workers selected from nine major construction sites of the capital The Bihar report is based on survey of women workers employed by the two major construction projects in and around Patna namely, the Ganga Bridge Project and the Storm Drainage Scheme. While the Delhi study covers mainly workers in private construction projects, the Bihar study concentrates entirely on workers in government projects

The monograph highlights the contribution of women construction workers to the national economy. The surveys also help to explode the myth that women do not engage in occupations which involve hard and arduous physical labour. These two studies which are exploratory and illustrative rather than exhaustive also bring into focus the pitiable and horrible living and service conditions of this category of workers. Because of the unorganised nature of this labour, attempts to protect these workers—whether by law or official regulations—generally end in futility.

The two studies contained in *Women Construction Workers* will help to stimulate greater interest in the problems of this group of women workers among social scientists and welfare agencies. The grim nature of the findings calls for immediate measures to ameliorate and improve their living conditions.

Development Notes

Copper Ore Deposits In Karnataka

Copper ore deposits have been detected over a "strike-length" of 1,100 metres in kallur, about 20 km from Raichur. Eight boreholes had been completed to examine the nature of the ore and also the grade at depth. According to preliminary estimates, the reserves are of the order of six million tonnes. The average grade of the ore works out to 0.8 to one per cent per tonne which is commercially exploitable. This was the fourth deposit found in Karnataka. The other three sites were Ingaldal in Chittadurga district, Kalyadi in Hassan district and Thinthini in Gulbarga district.

The state government is taking concerted steps for the development of this precious deposit. At present the Chittadurga Copper company is converting the copper ores into concentrates at Ingaldal and Kalyadi and supplying it to the Copper Corporation of India. Plans are also afoot to set up a copper smelter plant in the state.

The Department of Mines and Geology has also unearthed, 'kynite', one of the important refractory minerals, near Sulya in South Kanara. The mineral ore is believed to be spread over a 250-square km area and the deposit is estimated at 60,000 tonnes.

Cotton Production in Nagarjunasagar Area

The Nagarjunasagar project area of Andhra Pradesh holds the prospect of becoming a "mini-Egypt" in the coming years, taking the country to near self-sufficiency in extra-long staple cotton. The project area comprising parts of Prakasam, Guntur and Krishna districts has been found most suitable for the cultivation of 'Suvin' which is comparable to the best varieties like Giza-45.

In view of 'Suvin' emerging as an effective substitute for imports a campaign was organised for 'Suvin' Cotton Development in Tamil Nadu and Andhra Pradesh in 1975-76. The total area covered by the scheme was 30,000 acres in Andhra Pradesh and 12,000 acres in Tamil Nadu.

World Bank Aid to Farm Varsity

The World Bank has sanctioned an assistance of Rs. 395 lakh to Jawaharlal Nehru Krishi Vishwa Vidyalaya (JNKVV) at Jabalpur, Madhya Pradesh for further development and upgradation of its seven research stations and five sub-stations. The assistance is for strengthening research work in progress on various crops and different aspects of cultivation and agricultural management at Jabalpur, Indore, Gwalior, Rewa, Sehore, Powarkheda and Chhindwara and sub-station at Khandwa, Mandsaur, etc. Selection of these places has been made to cover all the main crops and agro-climatic zones of the State.

Cashew Cultivation to be Extended

The Kerala state government proposes to extend cashew cultivation to an area of 20,000 hectares this year and has provided Rs. 28 lakh in the current year's budget for payment of subsidy to the cultivators. At a seminar on "cashew with accent on infestation", organised by the Export Inspection Agency Cochin, it was stressed that possibility of increased production of cashew sufficient to cater to the requirements of more than 200 factories employing 125,000 workers in Kerala alone was not a distant dream.

The State Government's programme comprises distribution of two million cashew seedlings free of cost and giving subsidy to the small cultivators.

Marked Upsurge in Exports

Both traditional and non-traditional exports showed a big increase in 1976-77 compared to the previous year. Tea export increased from 212 million kg worth Rs. 237 crore to 243 million kg, worth Rs. 293 crore, oil-cakes from 1,059,000 tonnes valued at Rs. 96 crore to 1,727,000 tonnes worth Rs. 224 crore, cotton piece-goods (mill-made) from 423 million sq. metres valued at Rs. 122 crore to 562 million sq. mts worth Rs. 210 crore in this period.

Other items, the export of which rose, were coffee from Rs. 67 crore to Rs. 114 crore, fish from Rs. 127 crore to Rs. 180 crore and tobacco from Rs. 93 to Rs. 97 crore. Total exports increased from Rs. 4,043 crore to Rs. 5,089 crore in this period.

Among the non-traditional items handicrafts export increased from Rs. 252 crore to Rs. 402 crore, engineering goods from Rs. 413 crore to Rs. 554 crore, cotton apparel from Rs. 146 crore to Rs. 257 crore, iron and steel from Rs. 68 crore to Rs. 283 crore and chemicals and allied products from Rs. 85 crore to Rs. 109 crore.

Four-fold Increase in Engineering Goods Exports

The export of engineering products from the country touched Rs. 552 crore during 1976-77 representing a four-fold increase from a mere Rs. 141 crore in 1972-73. The exports of these goods during 1975-76 were of the order of Rs. 408 crore. In the overall export value of engineering goods, the capital goods sector occupies a significant place with its share of Rs. 178.1 crore during 1976-77 against Rs. 154.5 crore in the preceding year. In the capital goods sector the export of industrial plants and machinery was of the order of Rs. 42.2 crore during the period under review.

Electrical power machinery and switch gears also constitute a dynamic line of export among the capital goods industries with its export performance at Rs. 15.8 crore compared to Rs 14.9 crore during 1975-76. The export of transmission line towers and poles fetched Rs. 9 95 crore in 1976-77 as against Rs. 735 crore in the previous year. Machine tool exports more than doubled from a level of Rs. 8.4 crores to Rs. 18.1 crores during 1976-77. Likewise the exports of automobile parts also registered a substantial increase from a mere Rs. 18 crore in 1975-76 to Rs. 23.3 crore in 1976-77.

The Wisdom of Schumacher

NOW, at the risk of being misunderstood, I will give you the simplest of all possible examples of self-help. The good Lord has not disinherited any of his children and as far as India is concerned he has given her a variety of trees, unsurpassed anywhere in the world. There are trees for almost all human needs. One of the greatest teachers of India was the Buddha, who included in his teaching the obligation of every good Buddhist that he should plant and see to the establishment of one tree at least every five years. As long as this was observed, the whole large area of India was covered with trees, free of dust, with plenty of water, plenty of shade, plenty of food and materials. Just imagine you could establish an ideology which would make it obligatory for every able-bodied person in India, man, woman and child, to do that little thing—to plant and see to the establishment of one tree a year, five years running. This, in a five-year period, would give 2000 million established trees. Anyone can work it out on the back of an envelope that the economic value of such an enterprise, intelligently conducted, would be greater then has ever been promised by any of India's five year plan. It could be done without a penny of foreign aid; there is no problem of savings and investment. It would produce foodstuffs, fibres, building material, shade, water, almost anything that man really needs.

Centralisation is mainly an idea of order; decentralisation, one of freedom. The man of order is typically the accountant and, generally, the administrator while the man of creative freedom is the entrepreneur. Order requires intelligence and is conducive to efficiency, while freedom calls for, and opens the door to, intuition and leads to innovation.

Socialists should insist on using the nationalised industries not simply to out-capitalise the capitalists—an attempt in which they may or may not succeed—but to evolve a more democratic and dignified system of industrial administration, a more humane employment of machinery, and a more intelligent utilisation of the fruits of human ingenuity and effort. If they cannot, they have nothing to offer that is worthy of the sweat of free-born men.

For it is not private ownership but private ownership divorced from work which is corrupting to the principle of industry; and the idea of some socialists that private property in land or capital is necessarily mischievous is a piece of scholastic pedantry as absurd as that of those conservatives who would invest all property with some kind of mysterious sanctity.

To sum up:

(a) *In small-scale enterprise, private ownership is natural, fruitful and just.*

(b) *In medium-scale enterprise private ownership is already to a large extent functionally unnecessary. The idea of 'property' becomes strained, unfruitful and unjust. If there is only one owner or a small group of owners, there can be and should be a voluntary surrender of privilege to the wider group of actual workers, as in the case of Scott Bader and Co. Ltd. Such an act of generosity may be unlikely when there is a large number of anonymous shareholders, but legislation could pave the way even then.*

(c) *In large-scale enterprise, private ownership is a fiction for the purpose of enabling functionless owners to live parasitically on the labour of others. It is not only unjust but also an irrational element which distorts all relationship within the enterprise.*

NATIONALISED enterprises providing public services should always aim at a profit—in the sense of eating to live, not living to eat—and should build up reserves. They should never distribute profits to anyone, not even to the government. Excessive profits—and that means the building of excessive reserves—should be avoided by reducing prices.

Even if the rich are not idle rich, even when they work harder than anyone else, they work differently, apply different standards and are set apart from common humanity. They corrupt themselves by practising greed, and they corrupt the rest of society by provoking envy.

It is often thought the public interest can be safeguarded in the conduct of private business by delegating top or medium-grade civil servants to management. This belief, often a main plank in proposals for nationalisation, seems to me to be both naive and impractical. It is not by dividing the responsibilities of management but by ensuring public accountability and transparency that business enterprises will be most effectively induced to pay more regard to the public interest than they do at present. The spheres of public administration on the one hand and of business enterprises on the other are poles apart—often even with regard to the remuneration and security offered—and only harm can result from trying to mix them.

ALL THE indications are that the present structure of large-scale industrial enterprise, in spite of heavy taxation and an endless proliferation of legislation, is not conducive to the public welfare.

'Small is Beautiful'

I Hate Privilege and Monopoly

ORGANISATION OF MACHINERY for the purpose of concentrating wealth and power in the hands of a few and for the exploitation of many, I hold to be altogether wrong. Much of the organisation of machinery of the present age is of that type.

Machinery and modern industry, Mr Gregg truly says, have taken the money of millions of people and concentrated its management and control into relatively few hands and modern development of banking and credit have concentrated the control of all the materials and factories [illegible] fewer hands.

Do we not see the pres[illegible] our own country at the cost of the million [illegible] ing blood whom in order to support [illegible] thousands of miles away from [illegible] aptly says Mr Gregg the real [illegible] nations of Europe, America and [illegible] Africa is concentrated in the hands of [illegible] men perhaps fewer [illegible] temptation which [illegible] It involves [illegible] countries [illegible] security [illegible] dence degradation [illegible] respect on the other.

Another [illegible] made to obey [illegible] classes become helpless [illegible] the classes [illegible] they also become helpless [illegible] cannot make his own [illegible] his own food. The city [illegible] country industrial nations upon [illegible] Those who live in temperate climates [illegible] parasitic upon tropical peoples [illegible] upon the peoples they govern, anim[illegible] Along with this [illegible] irrespon[illegible] The industrial [illegible] issues all those in Europe which [illegible] the lives of Negroes in Central Africa.

The consumers too are no better. They [illegible] to feel the responsibility. 'When I,' exclaims Mr Gregg, 'seated in a restaurant in France, put some pepper in my soup, do I stop to think what poor coolie in Java perchance suffered the hardship of gathering it while subject to a fever, and perhaps to the indignities and brutality of harsh plantation supervision?'

I must, however, resist the temptation to quote more from this instructive letter. That use of machinery is lawful which subserves the interest of all.

There is a tremendous fallacy behind Mr Ford's reasoning. Without simultaneous distribution on an equally mass scale, production can result only in a great world tragedy. Take Mr Ford's cars. The saturation point is bound to be reached, soon or late. Beyond that point, the production of cars cannot be pushed. What will happen then?

Mass production takes no note of the real requirement of the consumer. If mass production were in itself a virtue, it should be capable of indefinite multiplication. But it can be definitely shown that mass production carries within it its own limitations. If all countries adopted the system of mass production there would not be a big enough market for their products. Mass production must then come to a stop.

[illegible] Mr Ford's favourite [illegible] remotest corner [illegible] thousands of [illegible] factories [illegible]

[illegible]

[illegible] because when [illegible] machines [illegible] one selected [illegible] be found [illegible] limitless power [illegible] think of it. The [illegible] of power [illegible] this power for [illegible] would [illegible]

[illegible] Russia [illegible] developed mass [illegible] sense, the less [illegible] taking into its [illegible] controlled industry [illegible] economic order in which both production and distribution are controlled and regulated by the state as is being today done in Soviet Russia. Well, it is a new experiment. How far it will ultimately succeed I do not know. If it were not based on force, I would dote on it. But today since it is based on force, I do not know how far and where it will take us.

So you are opposed to machinery only because and when it concentrates production and distribution in the hands of the few,' finally summed up the American friend.

'You are right,' I replied. 'I hate privilege and monopoly. Whatever cannot be shared with the masses is taboo to me. That is all.'

—MAHATMA GANDHI

Thank God, We are Inefficient

A Nation at the Crossroads

LENIN : ICON OR AN IDEA ?

THE GUNS OF AURORA

Only the Winter Palace occupied by the Junkers was firmly in the hands of Kerensky when the uprising began at 2 a.m. on November 7. The telegraph and telephone exchanges had already been occupied besides other palaces. The Bolshevik Central Committee was in continuous session at Smolny directing the operations. Attempts to re-take the telegraph building were repelled by the Red Guards. The sailors from the Baltic fleet occupied the state bank and other government buildings. The cruisers, *Aurora* and *Amur* sailed up the Neva in preparation for the assault on the Winter Palace.

It was 10 a.m. when the Bolsheviks formally proclaimed the overthrow of the provisional government. Within an hour the political prisoners were set free. At 2.35 p.m. the Petrograd Soviet began its session at Smolny. There was delirious enthusiasm when Trotsky announced that the provisional government had ceased to exist. Lenin appeared in public.

By 6 in the evening, the Winter Palace had been surrounded. At 9.40 p.m. came the crash of *Aurora's* warning shots at the palace. At 11 p.m. the final assault began with the guns of *Aurora* blazing away while the Red Guards and the workers from the Putilov factories stormed the palace. By one in the morning the palace fell and all the ministers were arrested. The Junkers were disarmed. The revolution had been accomplished.

In Russia at last! Whichever way I look, I am filled with wonder. It is unlike any other country. It is radically different. From top to bottom they are rousing everybody up without distinction

Rabindranath Tagore

A Continuing State After Sixty Years

COMMENTING ON THE concept of the state "withering away", Lenin said that Engels had made it clear that in seizing state power, the proletariat "abolishes state as state"; that is, the proletarian revolution abolishes the bourgeois state. Lenin gave this meaning a further and abundant clarity by saying that Engels' words "about the state withering away refer to the remnants of the proletarian state after the socialist revolution".

Let us understand the distinction made by Lenin. He wrote, 'According to Engels the bourgeois state does not wither away but is abolished by the proletariat in the course of the revolution. What withers away after this revolution is the proletarian state or semi-state".

It would be useful, in this context to go to Engels himself. He said, "The first act in which the state really comes forward as the representative of society as a whole—the taking possession of the means of production in the name of society—is at the same time its last independent act as a state. The interference of state power in social relations becomes superfluous in one sphere after another and then ceases of itself The government of persons is replaced by the administration of things and the direction of the process of production. The state is not 'abolished', it withers away It is from this standpoint that we must appraise the phrase 'free people's state'—both its temporary justification for agitational purposes and its ultimate scientific inadequacy—and also the demand of the so-called anarchists that the state should be abolished overnight.".

LENIN ACCEPTED, elucidated and hoped to establish this theory adequately. His tragedy was that he died far too suddenly In a different (antithetical) context, Churchill said, "He (Lenin) alone could have found the way back to the causeway. The Russian people were left floundering in the bog". Though very few will agree with Churchill that the Russians' worst misfortune was Lenin's birth, there is great truth in his saying that their misfortune was his death when it came.

It is the misfortune not of the Russians alone, but of mankind He alone had both the completest grasp and the greatest opportunity of taking Marxian theory to its logical and enduring stage. But he was not allowed to do so by international conspiracy, the compulsions of establishing the proletarian state and his premature death, barely six years after he founded the world's first socialist state.

Lenin's decree on peace and open diplomacy, his profound commentaries on the irrelevance as well as the great danger of using state power in the intimate life of the people affecting their inalienable sentiments and emotions, his firm rejection of one-sided presentation of a case as anti-dialectical, his efforts to give the concepts of democratic centralism and inner party democracy flesh and life—all pointed to his impatience to move on to the goal of communism Thus did he say, "Polemics is the essence of socialist journalism" "We do not want to have people driven into paradise with a cudgel". "They (the Russian democrats) do not recognise national oppression in any form, even in the interests of Russian culture and statehood."

Lenin's difficulty was that, in the historical circumstance, he had to lead a particular revolution which undoubtedly, shook the

basis of the entrenched tyranny of the day—and not in sprawling Russia alone. Very probably he realised his messianic proportions—though, as Mayakovsky says, he was the embodiment of simplicity—and was concerned about the chance of degeneration of Marxian theory in the hands of lesser men without the kind of leadership which he himself provided. But he could not wait till he was certain of the continuum. And it was fortunate that he did not wait, for Lenin and his work constitute a priceless treasure of human heritage.

SOME OF HIS writings in the last stages of his life and mission suggest a gnawing concern over a new vested interest in the proletarian state and the party structure. Not merely this state might establish itself and not go through what he called "leaps and storms" leading to "withering away". More importantly, while the working class might reconstruct the economy, it might not either revolutionise society or advance to its next higher stage.

Lenin's writings on "parasitic state" could be read in this context. The distortion of Lenin's concepts of liberty in a socialist society, the wholly untenable assertion of mercenary "economism" as the core of "materialism", the perverse rejection of Lenin's unassadable belief in the growth of the human personality—all this has led to a total extinction of democracy either in centralism or inside the party and to an increasing rationale for the continuance of parasitic state against which, in essence, Sakharov and the like are probably fighting The argument that international power balance makes for the strengthening of the state negates the basis of Marxian theory that the people—liberated from class rule—can be more effective than the state. This is what Mao tried to establish, what was demonstrated during the Civil War and the period of intervention after the October revolution and recently in Vietnam

"NO POWER, no state"—the Gandhian ideal—was implied in Marx but Lenin did not see any contradiction, as did Gandhi, in the use of the state power to destroy the state itself Lenin took Marx too seriously to reduce him to scriptural proportions. Russia's destitution in Czarist decadence led Lenin to fashion a brilliant strategy which combined the rising tide of proletarian revolutionary fervour with the intellectual and moral heights of the Bolshevik pantheon. At the core of this strategy was the vanguard theory. Lenin's seeming violation of the principle of democratic centralism when he appealed to the larger Bolshevik conscience over the head of the Central Committee during the closing stages of the struggle was no violation at all; he was not usurping the functions of the Central Committee but retrieving it from authoritarian timidity and non-accountable inaction

Very soon, faced with the reality of an emerging oligarchy, Lenin began thinking of the cultural basis of the new society. He was thinking of utilising a new and liberated elite to counter the incipient degeneration of the revolution. The effulgence of Lenin's selflessness was a guarantee against degeneration while he lived By this time he had written millions of words. He had little time to subject his experience to a fresh enquiry. Had he lived a little longer, he would doubtless have led a new revolution against his own state, as Mao tried through the cultural revolution. Lenin would have carried Marxian dialectics to a new height. The "ten days that shook the world" gave us ample idea of where Lenin would have gone from "here", had he lived. His crusade against Great Russian chauvinism had already marked him out against the tyrannies inherent even in the vanguard theory. While he was impatient for giving his people good and decent life, he was preparing for the next stage when he died. That stage was the interpretation of Marx in what subsequently became Maoist language, namely, that economism as the sustenance of the revolution might destroy the revolution itself While the "evangelism" of his purpose led him to seek an altering of the material circumstance, he stood for that which "touched the people to their very souls".

EUROPEAN COMMUNISM'S reappraisal of the theory of proletarian dictatorship may be more basic than tactical. The rebellion against consumer society which is making man incidental to social theory may be seeking a messiah. The world may be groping for a Lenin.

Despite the many subsequent opportunisms in the world politics of balance of terror and involvement in the politics of manipulation, the socialist revolutions of Russia and China continue to be landmarks in the evolution of human society It is this evolution which will overcome the nuclear challenge called by Schumacher as the ultimate transgression

That the state, far from withering away continues to grow from strength to strength, does not call for a repudiatation of Marx, Engels and Lenin. What it calls for is a reappraisal of sixty years of Soviet history in order that this great land of revolution may again show the way for further "leaps and storms", to use a characteristic Leninist expression

A Nation at the Crossroads: Challenge Before Mr. Justice Shah

"AS GREAT disorder shapes up perceptibly under the Indian skies"

Thus begins a leading article in India's national daily, *The Hindu*. This newspaper, not generally known in recent years for forthrightness in the cause of Indian democracy, seems to have got back something of the elan of its earlier days. Even so, the prudery of its middle class clientele might have been somewhat shocked by the title of the editorial, "Cut the Cackle and Come to the 'Osses". Nor is this middle class likely to heed *The Hindu's* advice to all good men in politics "to take their eyes off narrow or short concerns".

Yet this is precisely the task and challenge before the broad spectrum of democratic political opinion in India. After the epochal events of March, when (to quote *The Hindu*) "three decades of Congress rule came to an abrupt and ignominious end" and the emergence of a new regime "appeared to signify the beginning of a new political era", besides representing "a resounding, if not stunning repudiation of authoritarian rule by the common people", who "having registered

their anger against the old regime" looked towards the new "with a mixture of joyous hope and slightly puzzled expectation", we are finding that "these hopes and expectations are being dissolved before our very eyes".

If the Janata Party and its government move from indecision to indecision and from inanity to inanity, he attempts by Smt. Gandhi and those close to her (who "have a great deal to answer for before the people and, where necessary, before the law courts") o "pose themselves as much wronged champions of lemocracy, social justice and the weaker sections of society" are neither "convincing" nor taking them anywhere.

RIGHTLY ASKING the Janata party to answer honestly the question of how well it has faced 'the challenge of development in a country with huge esources and with the great advantage of having the econd largest population in the world", this newspaper —promising to regain its status as a great national nstitution—has told our politicians of every party to eed the lessons of neighbouring Pakistan. It may be hat "India is in a happier position" than Pakistan where, "in the absence of a strong, freewheeling parliamentary tradition and experience, the explosive situation had to gravitate towards those who wielded the uns". But we cannot forget that only recently we did ravitate towards those who wielded the *danda*. As *The Hindu* has pointed out, "there is no reason at all o be complacent". The paper says (and it is difficult o disagree) : "The experience of third world countries as repeatedly demonstrated, during the last three decades, that the politics of confrontation among mere ndividuals, of parliamentary drift and of puerile demagogy, accompanied by the gross neglect of tackling asic development issues imaginatively, is fraught with he danger of a lurch into civilian politics by the bystanding military And it is by now well known, once n nearly always in".

The threat may not be as near and serious as *The Hindu* would have us believe But it will be good for oliticians to read in time the writing on the wall. Cowardice, caution, cleverness, gimmickry, postures of adicalism or pristine purity, shadow-boxing and quixotic tilting at the windmills, protestations of innocence f evil leading to proclamations of loyalty to the evildoer, fear of speaking out the truth before the people, he courts and the commissions, senseless vengefulness nswered by equally senseless violence, the wasting of ational energies in populist demonstrations of support nd opposition—can we afford this luxury while a ation at the crossroads is anxiously hoping for the sustenance of popular democracy ?

THIS IS not the time for ideological refinement or for personal or party loyalties. This is the time or a national consensus on basic issues of constitutional, educational, electoral, police and administrative evolution, of a programme of emancipation of the eople from poverty, drudgery, ignorance, squalor, isease, injustice and tyranny, of the participation of he mass of the people in this programme of emancipation—in short of meaningful democracy.

The lead should come from men like Jayaprakash ; qually from the magnanimity of the ruling party which, hile pursuing steadfastly the exposure, trial and punishment of the cabal that tyrannised over the people, should set the pace and tone of national reconciliation and federal cooperativeness. This is possible only if the leaders abandon the postures of all-knowing messiahs and approach their tasks with the utmost humility and dedication.

Quite appropriately, *The Hindu* has referred to "the serious impact" of recent events on the functioning of the Shah Commission "which with the enormous material and resources under its command has given evidence already of its potential to come speedily to grips with the larger and essential questions involved in emergency rule". Evidence suggests that Mr. Justice Shah had expressed his concern to the Prime Minister, in the context of a national duty which he had undertaken, at some personal cost in terms of health, time and money—at his advanced age—in the best traditions of the Indian judiciary. He explained at the start of the open hearings that he was not concerned with guilt and indictment but only with finding out the truth to the extent possible in relation an extraordinary period of our recent history. His purpose, clearly, was the strengthening of the fabric of our polity with its cherished traditions and institutions. With the groundwork already done and with the tone set by the first few days of judicial enquiry, sober public behaviour in the Commission room and responsible newspaper reporting, one may still hope that everyone will be eager to help this great and good judge in his task of enduring national consequence.

WHAT THE government does is its business and the Commission is certain not to be swayed by the passing winds of current day controversy. But the government, as much as the witnesses, owes the Commission a duty to do nothing which will interfere even remotely with its historic task of correcting the perspective of our democratic concerns.

—R. K. (11-10-1977)

Farakka Agreement

IT IS a tribute to the political courage, statesmanship and world view of the leadership that the Farakka agreement has been signed. Shri Jyoti Basu's reactions are on predictable lines but the chief minister has not succumbed to the temptation of rousing uninformed local emotion, unlike his predecessor. The fact that Shri Desai got more for India than Smt. Gandhi did is unnecessary to stress, because this will take away from the spirit in which an international understanding was reached, which may well be a pace setter for the settlement of disputes between countries. Smt. Gandhi's outbursts cannot dictate public policy and, fortunately, they have not interfered with a sensible decision.

The agreement cannot be measured in terms of how much we secured but in terms of how much we were prepared to accommodate, being the larger of the two negotiating parties—a thought which the communists may do well to cherish in this year of the diamond jubilee of Lenin's accomplishment.

The importance of Calcutta port need hardly to be stressed, for the saving of the port is a national responsibility. Except for a mischievous fringe nobody in Bengal thinks that Calcutta is anything less than India's premier city and a port of national importance. The Farakka agreement may not seriously jeopardise the efficiency of the port but government may be expected to offset any temporary difficulty by an appropriate remedy.

India's stake in Afro-Asian unity apart, the psychological impact of the agreement on a whole range of problems with our neighbour will far outweigh any

possible material damage which, in any event, is not such as cannot be repaired. A section of the leftist press in India had previously taken government to task for not honouring the commitment to Bangla Desh. The objection cannot come from that quarter. The slogan of surrender raised by some ignores the bold manner in which the international forces of "destabilisation" in the region have been thwarted !

Multinationals

SHRI CHARAN SINGH'S firm stand against multinationals and collaboration agreements and simultaneous leftist enderism of another minister whom they had earlier sought to hold up as their model would, in some measure, indicate the phoney nature of the political and economic debate in this country. Leftist criticism of the projected breaking up of the FCI on grounds of civil service lure for fancied foreign technology adds to the general irrelevance of the left-right differentiation. The CSIR debate has also not helped us understand who stands for what

Some recent bureaucratic announcements of agreements with the World Bank have received a mixed reaction, as is to be expected

In any event it is naive to think that aid—from international bodies or individual countries—does not carry with it strings. Collaboration agreements on a turnkey basis created their own distortions. Devaluation under pressure did not bring with it the rudimentary appreciation of the logic of dependence.

The mischief in "aid mentality" is that it predetermines economic and social policy. Very often aid and collaboration are in areas where they are hardly necessary.

Self-reliance has been more a slogan than an objective. This deception continues. The felony is compounded by ill-digested cries of "modernism in danger" The simple truth is that in most areas of development relevant to the people we can do the job ourselves, where we, indeed, cannot, we can have a sensible trade arrangement.

The problem with the Janata Party seems to be that it is not sure of the meaning of the Gandhian alternative and the limits of its usefulness in the present context. This is possibly being taken advantage of by the civil bureaucracy.

Procurement Prices

THE REJECTION of fantastic claims for paddy prices has been accompanied by announcement of movement policy. The prices question is often determined by lobbies, not merely of producers but of urban consumers The high cost of subsidy—as in oil prices in the absence of an energy policy—is only increasing the miseries of the rural poor. The states have not always shown a resolve not to succumb to pressure groups.

In any event government is yet to come out with a clear policy of taking advantage of a good harvest and a continuing high level of stocks for an employment programme which will give the poor the necessary purchasing power while at the same time generating worthwhile assets. Besides, a price control policy has to be integral and not merely in relation to isolated commodities and inputs. Distribution systems using available rural outlets and creating new ones, accompanied by a policy of requisitioning and a minimum of subsidy, where inevitable, will have to be worked out

Compartmentalised approaches do not seem to have been given up yet. Does the Planning Commission have a role in all this ?

Punjab Tiff

IT IS not clear yet what exactly the trouble was between Shri Talwar and Shri Jivan Singh Umranangal If the officer's stand was that a minister has no status in the administration, it is clearly untenable Much of the problem of administrative reform is the studied attempt by the top bureaucracy to make this its exclusive preserve, as though it is not a major political issue. To say that redressal should be sought only through official channels and not by access to ministers is plainly a way of declaring that there is a separate and inviolate sphere of administrative jurisdiction

There is of course, the problem of indiscipline arising from employees taking advantage of direct access to ministers This is a problem which can and must be resolved The prime minister and the home minister have already made it clear what their views are But it is a vastly different proposition if the top bureaucracy makes an issue of jurisdiction Clearly in our parliamentary democracy the executive is the Cabinet and not the bureaucracy which is only an instrument of the executive There is and can be no conflict to jurisdiction

The manner in which a public controversy was made of a simple matter of resolving a specific problem leads one to suspect that there is more to this than mere pique, petulance and injured dignity. Shri Badal's position seems unexceptionable when he says there is no conflict of roles at all, the officials are there to help ministers with disinterested and bold advice and that ultimately the responsibility for decisions lies with the ministers who are answerable to the people

It is time the bureaucracy gave up its ideas of independent grandeur and accepted its role in a parliamentary system Let its courage be shown in the independence of its policy advice—a quality not very much in evidence in recent years

Water Management

WHILE THERE may be merit in the argument for a national water policy, one does not see why a federal arrangement cannot work If an integrated view of inter-state problems is taken and a federal council is set up, it should be possible to sort out regional differences on a wide front The problem has always been a suspicion of a big brother attitude even where it does not exist Very often the Union gets a bad name for a good job If international problems can be settled across the table on the basis of equality, inter-regional problems can certainly be. Some element of commercial arrangement is likely to work better than a mere appeal to patriotic sentiment.

Since water management is urgent for rural development, prevention of floods, farm improvement and employment, two simultaneous steps are indicated—the setting up of a federal council consisting of ministerial representatives of all the states and a directive to engineers to come up very quickly with schemes which can be given effect to immediately and those which can be taken up in stages

A Brazen Reply

SHRI SHANTI BHUSHAN, in explaining a judge's elevation, perhaps forgot that he was replying to a revered figure of the resistance to the emergency. Otherwise he would have adopted a humbler tone. In any event one does not see the relevance of the references to the Law Commission or to the 27 (or is it 28) precedents in a circumstance of general disgust with the cavalier manner of appointments in recent years to the highest courts of the land

The boycott by the senior law officers of the government of the swearing-in ceremony at least redeemed the present regime insofar as it was a breath of fresh air and a departure from toadyism, subservience and abandonment of ethics which marked legal behaviour not so long ago.

However that be, it is time that an objective, well-understood and publicly-proclaimed policy of judicial appointments is evolved without delay, so that even bonafide actions may not be seen as backstage intrigues in high places.

This applies equally to important appointments to public sector bodies. If newspaper reports are to be believed, the styles of administration do not seem to have changed much. Secrecy leads to patronage and, therefore, the files concerning such appointments should be open to inspection by a statutorily-established body. Nothing less than a clean break with the ignominious practices of the recent past, now being brought to light, will make for public confidence in the professions of honesty of policy and purpose.

Thank God! We Are Inefficient

SAHADEVA

IT IS a quirk of elite logic that the greatest indictment of the drama surrounding Smt. Gandhi's arrest is that "it was bungled" Eight years ago after the Congress split, the ruling party convened its first council in New Delhi. For all the fanfare of a new ethos, a new spirit, that AICC session proved, mercifully, to be as extravagant, pompous, slothful and inefficient as most such sessions had been since 1947 There was a sigh of relief So long as we had a chance of muddling through, there was hope Efficiency, in the circumstances of the split, could have been a frightful monster The only saving grace of the emergency six years later was that it was inefficient

Probably Shri Gujral was sacked for not ensuring that no newspaper appeared on the morning of June 26, 1975 and some newspapers in New Delhi could escape the cutting off of power supply and brought out special supplements

It should be said to the credit of our knowledgeable columnists that they are not arguing for that kind of efficiency—but only just so Are these columnists and their reporting colleagues atoning for the write up of the arrest which appeared in most national newspapers on the morning after ? The tantrums of one aspiring to be a star performer with an eye to the spectators, an outburst in Lady Macbeth's style—unsex me here—, the masking of cowardly arrogance of spoilt children as outraged innocence, the racing of cars, the posture of "patience on a monument"—only it was a culvert—, and the imperial gesture of condescension—how was all this juxtaposed with a wholly refreshing demonstration of patience, courtesy and dignity of a police force which, only until recently, was known for the efficiency of its "cloak and dagger" operations ? In the face of the gravest of provocations which, in other circumstances, might have brought forth instant retaliation, the constabulary acted without blood-shot eyes even to the point of being shown up as being chicken-hearted, inefficient, hesitant, irresolute and generally comical.

HOW was all this portrayed in the reporters' columns ? What was the picture that emerged from the imaginative coverage of a farcical drama in which the star performer was held up to ridicule ?

Whether the police attitude was deliberate policy or showed unpreparedness for undignified behaviour elsewhere, the result was an image of the force as humane even in a circumstance of extraordinary rival petulance.

Only when the release order came, everyone seems to have woken up to a sense of "bungling" even from the previous day Is it not rather funny that the assertion of magisterial independence itself is held against the police ? If nothing succeeds like success, nothing fails like failure, it seems

Is it being suggested that we should go back to the days of the mid-night knock, the whisking away of hundreds and thousands of people to unknown destinations under an elaborate cover of secrecy, the denial of the judicial process, the falsification of evidence and retrospective legislation ? Is it suggested that a person released should be picked up again at the gates of the court as was the practice for almost a decade now ? Is it suggested that the arrest, the appearance in court and the release should have been done so efficiently that nobody would have known about it ? Is it suggested that the supporters—they are obviously numerous—should have been held back at the Red Fort or at Mehrauli ? Is it suggested that the crowd should have been fired upon ? Or is it suggested that the magisterial order should have been anticipated ?

THEN THERE is the argument that Smt Gandhi is no ordinary person and the retreat lines should have been properly manned Most certainly, Smt. Gandhi is no ordinary person She is the daughter of Jawaharlal Nehru and the grand daughter of Motilal Nehru, even if she is the mother of Shri Sanjay Gandhi It is this—not the fact of her prime ministership—which makes any action in regard to her more than a party, cabinet or individual issue It is a national question Precisely for that reason it would have been craven cowardice to ensure that all escape lines were barred If the fuller play of public opinion is necessary concomitant of democratic polity, its importance is greater when we deal with the daughter of one of modern India's chief architects If for nothing else, the inefficiency of the operation, supposed or real, is something to be thankful for, because it has given the people of this country a chance to exert the pressure of their opinion Its influence on public policy will be profound

Would the press have had the opportunity or the judiciary the chance of upholding the sovereignity of law and the people, if the state were more efficient than it is ?

The efficiency brigade is working on the wings It will only want the exact setting to reduce democracy to a secret operation Let us not forget that the tallest of men and women only recently were the victims of

this kind of efficiency.

SMT. GANDHI'S arrest and release are matters of national concern. But the humanity of police behaviour, the resurgence of judicial independence, the freedom for even the perpetrators of crimes to live, move, speak and be cheered freely, the presumption of their innocence till the crimes are proved, the scope for the fullest expression of public opinion and the opportunity of the widest public debate—these have been the assets in a long catalogue of failures. The nation's stake is not in one party or the other but in the preservation of the democratic content of our polity. It was this which was in danger in the seeming efficiency of the emergency. Its last chance is in a measure of political, administrative and police inefficiency, which is only a foil of open society.

Freedom Is Indivisible

Wake Up Shri Advani

KAUSHIK

THE AUSTRIAN Federal Chancellor has only confirmed the widely-propagated assertion by the "emergency underground" of the international solidarity behind the Indian people's fight against the nineteen-month despotism. By sending his envoy in India to Patna to convey a personal message of admiration to Jaya Prakash for his relentless struggle for freedom, the Chancellor, Dr. Bruno Kreisky, like many of the socialist leaders of European governments, has made it known that the stupid proprieties of official behaviour cannot come in the way of a partisanship with the struggles against oligarchies, elected or otherwise Dr. Kreisky with many leaders of the Socialist and Amenesty Internationals had intervened in favour of the political prisoners

Though a glimpse of the swelling tide of liberal world opinion against the infamous emergency has been had by the Indian people through the recent meetings in this country of the friends of India abroad, through scattered bits of news appearing in the press and through some broadcast talks, the flood of writings, speeches, demonstrations, appeals, parliamentary debates, pressures on governments by liberals of different hues in widely scattered parts of the world, is still a closed book to most of our countrymen. The worst kind of censorship had kept us dark about the burgeoning of the world response to the Indian struggle reminiscent of the days of the Spanish civil war

BERNARD LEVIN made India's cause his own. Fenner Brockway poured out the anguish of his heart David Selbourne took Jannie Lee to task. The New Statesman lambasted the Rt Hon'ble Michael Foot. Colin Welch, James Cameron, Oriana Fallaci, the American, European, Canadian, Australian and Japanese press, Scandinavan and Irish leaders in government and elsewhere, the foreign broadcasting stations—official or private—, David Loshak, Jack Anderson, scientists, composers, writers, professors, widely differing otherwise—all of them in a unique demonstration of solidarity fought relentlessly for the restoration to the people of India of their inalienable rights of freedom If Litvinov said that "peace is indivisible", and others elaborated the idea to embrace prosperity, liberals the world over have repeatedly asserted that freedom is equally indivisible Members of the Australian Senate, returning from India, made it their mission to rip the mask of democracy and show to Australian Parliament and people the true face of the Indian version of semi-fascist humbug.

And what protection, encouragement and liberal help was given to Indians abroad fighting for the cause of freedom! Foreign correspondents came to India in the guise of tourists to keep the international press fully supplied with all the facets of the fraud and falsehood that passed for emergency.

And yet how do we behave? We want to keep on assuring governments that our soil will not be permitted to be used to organise even opinion against continuing tyrannies. And, sometimes, we are not even ashamed of throwing out of India brave men who had sought our haven for their struggle in the cause of freedom. Delhi is, of course, not London.

IT IS AMAZING that the new government should not affirm the principle of indivisibility of freedom and should take shelter in the pruderies of non-interference in the supposed internal affairs of other countries. We even wish to profit by mercenary understandings with despotisms Indian freedom can never be secure without an understanding of the universality of the struggles against personal dictatorships

If we have been kept in the dark about the international response, we have been equally kept ignorant about the glorious national response—individual and collective Except for the Baroda dynamite case, the tortures suffered by some people like Snehlata Reddy, Lawrence Fernandes, Rajan and a few others and the stories of resistance in scattered places, little has been told of the magnificent sacrifices of noble Indians—and this after six months of liberation from tyranny.

How many people have heard of the determined stand of men like Gaur Kishore Ghosh, Uma Shankar Joshi, M C Chagla and Bhawani Prasad Misra? How many know of the resolute defiance of journals like *Mainstream, Seminar, Opinion, Sadhana, Janata, Bhoomiputra* and *Himmat*?

How many know of the spirited speeches in Parliament? How many know that the veteran leader of social movements P Kodanda Rao, wrote to Smt Gandhi from his deathbed imploring her to turn back from the road to perdition? He quoted from a memorable speech of Winston Churchill in the House of Commons in July 1942 when Britain was fighting for her survival The quotation was :

"This long debate has now reached its final stage. What a remarkable example it has been of the unbridled freedom of our parliamentary institutions in times of war! Everything that could be thought of or raked up has been used to prove that ministers are incompetent and to weaken their confidence in themselves; to make the army distrust the backing it is getting from the civil power: to make workmen lose confidence in the weapons they are striving hard to make; to represent the government as a set of non-entities over whom the prime minister towers, and then to undermine him in his own heart and, if possible, before the eyes of the nation! All this poured out by cable and radio and the press to all parts of the world, to the distress of our friends and to the delight of our foes!

"I am in favour of this freedom, which no other country would use, or dare to use, in times of mortal peril such as those through which we are

passing."

Others like Bhimsen Sachar quoted Jawaharlal Nehru in an appeal to Smt. Gandhi's conscience only to find themselves arrested. And a great artist and dedicated social worker thought it better to end his life than suffer the suffocation of freedom.

Many gave up the badges of honour. Thousands courted imprisonment voluntarily.

Do the people of India know anything of the national and international response to the challenge thrown by a despotic regime? What are Shri Advani and Shri Pratap Chunder Chunder doing?

THE FIBRE of our people, their faith in their inherent power to resist, their confidence in the future will be reinforced if the story is pieced together quickly and told through a thousand ways, in song, legend and ballet. Is the Ministry of Information & Broadcasting aware of its responsibilities? What are its various functionaries doing over and above poring over irrelevant files?

Wake up, Shri Advani. "Strike, strike at the root of penury in my heart", said the poet. And one may add "Strike, strike terror in the hearts of aspiring tyrants", through a nation roused.

Lenin's 'Magic way'

GIRISH MATHUR

THE OCTOBER REVOLUTION was not "transfer of power"; nor was it a *coup*. It was not as if on 25 October, 1917 (according to the new calendar, 7 November), Lenin and the Bolsheviks took over or captured a running state machinery and then set about using it for their purposes. What took place on that date was a revolution, and a revolution marks at once the end of the old and the beginning of a new system. If revolution is biggest act of destruction, it is also the greatest act of construction. But a revolution is not something achieved in one blow; it is a process. Nor is it subject to the whims and wishes of those who seek it; it is governed by social laws which have to be studied by the revolutionaries to be able to lead it to *its* logical end and save it from disintegration. We in India have chosen different social objectives and a different path to achieve them, but we do recognise the difference that the October Revolution has made for the humanity and are, therefore, interested in studying its dynamics.

Since it was the first socialist revolution, Lenin and the Bolsheviks did not have a model before them according to which they could go about their job. Marxism had taught them the general laws of social development, but Marxism had also taught them that every development was governed by the specific features of the situation in which it took place, and they had to go by the hard facts of the specific situation in which they were operating, study these facts, subject them to rigorous analysis, minutely observe the different trends, assess the strength of these trends and their own capacity to influence them, and thus lay down their broad strategy and day to day—nay, hour to hour—tactics. An interesting example of how they went about their job is provided by a perusal of a pamphlet Lenin wrote less than a month before the final assault on 25 October.

LENIN TOOK up the question "Can the Bolsheviks Retain State Power?'—which became the title of the pamphlet—and answered all the doubts which lay behind the question. One of the doubts related to their ability to lay their hands on the state apparatus and another to their capacity to run it even if they were able to get it. Analysing the two points at length Lenin pointed out that primarily the state apparatus consisted of the army, the police and the bureaucracy, and the Bolsheviks did not intend to "lay hands" on these but to smash them He emphasised that the Bolsheviks intended to replace these wings of the state apparatus by new ones which had already come into being in the form of the Soviets of Workers', Soldiers' and Peasants' Deputies.

As for the capacity of the Bolsheviks to run the Soviets, Lenin analysed the current developments to point out that the Soviets had in fact begun "running". The real question was to overcome the resistance of the existing state apparatus which was in the process of being smashed up and to establish workers' control. The "means of control" had been forged by the system under attack "in its military-imperialist stage"; grain monopoly, bread rationing and labour conscription were used by the ousted ruling class to control the workers and the poor. Now these "means of control" would be used to break the resistance to the establishment of workers' control; the rich would now have to get work-book; if they worked they would get their rations.

Analysing various voting figures Lenin pointed out that workers and the peasantry were against a coalition with other sections. Besides, he pointed out, "Since the 1905 revolution Russia has been governed by 1,30,000 landowners who have perpetrated violence against 150,000,000 people. Yet we are told that the 240,000 members of the Bolshevik party will not be able to govern Russia in the interests of the poor and against the rich. These 240,000 are backed by no less than a million votes of the adult population We, therefore, already have a 'state apparatus' of one million people."

HE WENT on to add, "In addition to that we have 'a magic way' to enlarge our state apparatus *tenfold* at once, at one stroke, a way which no capitalist ever possessed or could possess. This magic way is to draw the working people, the poor, into the daily work of the administration. This is what he had in mind when elsewhere in the same pamphlet he wrote that "it is important to introduce more democracy into the administration of a proletarian state" and emphasised at yet another place the need to "devise the simplest, cheapest, most convenient and universal measures and methods of control"

Lenin himself gave an example of how his 'magic way' would work. He said that evictions of working class families for non-payment of rent were a common occurrence and the appearance of the bailiff with police and militia in a working class area invariably caused tension and roused the fury of the neighbours. Once the Soviets exercised control, squads of representatives of different sections of the people would go to the localities of the rich, survey available space during the winter, ask the rich occupants to squeeze into less space and make room for working class families in the spare rooms; the non-working members of the families of the rich who could work would be asked to look after cleanliness and sharing of the facilities in their houses.

Lenin then went on to emphasise that "we are not utopians; we know that an unskilled labourer or a

cook cannot immediately get on with the job of state administration; we, however, demand immediate break with the view that only the rich, and officials chosen from the rich families, are capable of administering the state ; we demand training in the work of administration by class conscious workers and soldiers and this training be begun at once, that is, that a beginning be made at once in training *all* the working people, all *the poor*, for this work." Also, Lenin fully conceded the need for discipline in administering the state , in fact his claim that the Bolsheviks could manage the state was based on precisely the argument that "we alone have class conscious workers disciplined by long capitalist 'schooling' who are capable of forming a workers' militia and expanding it into a militia *embracing* the whole people "

LENIN'S INSISTENCE on involving the widest sections of people in the administration was derived from his close study of Marx's writings on the short-lived Paris Commune While providing day to day leadership to the Bolsheviks from underground, Lenin wrote his well-known theoretical work *State and Revolution* during August-September, 1917, in which he examined the whole question of state power keeping in mind the practical issues facing the Bolsheviks as they were preparing for the final bid for power. Quoting Marx he wrote that the "working class must break up, smash the ready-made state machinery' which "was to be replaced by the proletariat organised as the ruling class, by winning the battle of democracy."

The key phrases in this formulation are "proletariat organised as the ruling class" and "winning the battle for democracy," meaning that the working class as a whole had to function as the ruling class which would mean *genuine* democracy The point was clarified by Lenin when, referring to the Paris Commune, he wrote that it "replaced the smashed state machine by fuller democracy : abolition of the standing army, all officials to be elected and subject to recall " According to the Marxists, the state is the organ of the ruling class to suppress the people , Lenin argued that when the vast masses of the people themselves became the ruling class, a special force for the suppression of a tiny minority of the former ruling class was no more necessary.

He wrote, 'Instead of the special institutions of a privileged minority (privileged officialdom, the chiefs of standing army), the majority itself can directly fulfil all these functions, and the more the functions of state power are performed by the people as a whole, the less need there is for the existence of this power. In this connection, the following measures of the Commune, emphasised by Marx, are particularly noteworthy · the abolition of all representation allowances and of all monetary privileges of officials, the reduction of the remuneration of all servants of the state to the level of workingmen's wages This shows more than anything else the turn from bourgeois to proletarian democracy, of the oppressors to that of the oppressed classes, from the state as a special force for the suppression of the people to the suppression of the oppressors by the *general force* of the majority of the people—the workers and peasants "

BEGINNING WITH the "majority of the people" Lenin visualised the stage when "the whole population without exception" would function as the state apparatus. He pointed out that culture has created large scale production, factories, railways, postal service, telephones, etc., and on this basis the great majority of the functions of the old state power have become so simplified and can be reduced to such exceedingly simple operations of registeration, filing and checking, that they can easily be performed by every literate person for ordinary workingman's wages and can (and must) be stripped of every shadow of privilege, every semblance of 'official grandeur'. All officials without exception elected and subject to recall at any time, their salaries reduced to ordinary workingman's wages—these simple and self-evident democractic measures, while completely uniting the interests of the workers and the majority of peasants, at the same time serve as the bridge leading from capitalism to socialism."

Lenin again and again emphasised that "it is necessary to convert the functions of the civil service into the simple operations of control and accounting that are within the scope and ability of the vast majority of the population, and, subsequently, of every single individual " He added, "if careerism is to be avoided completely, it must be made impossible for 'honourable though profitless posts in the civil service to be used as springboard to highly lucrative posts in banks or joint stock companies as constantly happens in all the freest capitalist countries "

THESE THEORETICAL propositions informed the practice of the Bolsheviks when they came to power, although at times they had to make compromises Lenin always justified compromises when necessary, provided the main task was kept in mind and the compromise helped in the advance towards the accepted goal Within six months of coming to power, Lenin wrote a document entitled *"The Immediate Tasks of the Soviet Government"* in which he dealt with administrative problems and pointed out that the main task before them at that stage was not so much the destruction of the remnants of old institutions as consolidation of the gains made so far and building new instiutions. He pointed out that "our work of organising country-side accounting and control of production and distribution under the supervision of the proletariat has lagged far behind our work of directly expropriating the expropriators." He repeatedly emphasised that introduction of socialist reforms was held up "because accounting and control are insufficiently organised in general " He pointed out that, unless the state monopolies in grain, leather and the like were consolidated and improved, they could not go ahead with the take over of foreign trade, and likewise bank nationalisation could not transform banks into "nodal points of public accounting under socialism" unless they achieved "real success in increasing the number of branches of the People's Bank, attracting deposits, simplifying the paying in and withdrawal of deposits by the public, abolishing queues, catching and shooting bribe-takers and rogues, etc " He also complained that they were lagging behind in the collection of taxes

He warned that "without comprehensive state accounting and control of production and distribution of goods, the power of the working people, the freedom of the working people, cannot be maintained, and a return to the yoke of capitalism is inevitable." He said that capitalism had been defeated but not yet crushed, and that is trying, on the one hand, to operate from outside by "methods of conspiracies and rebellions', and, on the other, "operate from within and take advantage of every manifestation of disintegration, of every weakness, in order to bribe, to increase indiscipline, laxity and chaos." He also pointed out that "since the revolution occurred so rapidly" it was impossible to

prevent a certain number of "adventurers and rogues from getting into positions of authority, and they, together with a number of inept and dishonest commissars, would not be averse to become star embezzlers of state funds." This further underlined the need for developing accounting and control and called for "not military suppression but administration, not shooting on the spot but trial by court."

Lenin emphasised that "the socialist state can arise only as a network of producers' and consumers' communes which consistently keep account of their production and consumption, economise on labour, and steadily raise productivity of labour." These communes were to him "a new democracy" which enabled "independent participation in the administration of the state by tens upon tens of millions of working or exploited people". He repeatedly emphasised that "there is no freedom and no democracy where there is suppression and violence" and that the time had come for them to clear the debris of the smashed bourgeois institutions and for "careful nursing of the rudiments of the new system which are growing amidst the wreckage on a soil which has as yet been badly cleared of the rubble." These rudiments were arising out of mass participation in the administration with the working people themselves becoming the ruling class.

THIS WAS the 'magic way' by which Lenin sought to build the new state. But he was not to live long. Moreover, the state is a social phenomenon which is under construction all the time; in the years since Lenin's death the Soviet state has passed through many formal and informal changes. It is hoped that the new constitution which the Soviet people have recently adopted will mark an advance towards the kind of state which Lenin sought to build.

Lenin : Icon or an Idea?

FOR MORE than a century and a quarter the world of Europe was used to regarding the French Revolution as the ultimate in political upheaval Basking in the gains of the great event, Europe spread out into Asia and Africa inaugurating the dark age of colonialism in world history, and betraying the Revolution in the process. But the epoch also midwifed the industrial revolution and wrote the envoy to feudalism.

The late nineteenth century European civilisation flourished on "the white man's burden" abroad and the industrial galley-slaves at home. World War I was fought between the empire builders for the greater luxury of their dining rooms and parlours. While the imperialists were at each other's throat, rolled a peel of thunder—from Russia—presaging the dawn of a "New Civilisation". It rocked the very foundation of world capitalism which reached its apogee in the imperialist order in the vast lands of Afro-Asia

The exhilarating cry of "Workers of the World Unite" was heard in 1848. It sounded like a banshee wail. Marx and Engels also revealed the spectre of communism hanging over Europe. In October 1917 the word was made flesh, and it was no spectral apparition.

Historians will never be unanimous on what was Lenin's greatest achievement. Organising the CPSU, working the levers of revolution, proclaiming the first socialist state or winning the fight for survival - all are so inextricably interlocked that the summation alone would give the whole picture of this epic personality And in this case, the whole is more than the sum of its parts. What is more is the Lenin who spilled out of the borders of the Soviet state. Inside the Soviet Union he is the father figure par excellence Outside it, he is an idea which inspires. The accident of birth and the revolution he steered through made him a Soviet Russian phenomenon The cause he espoused made him a global presence.

THE CORPUS of Marxism presented nothing more than the goal of socialist state. Bush-whacking to reach the goal was Lenin's historic mission. The prospect of taking over charge of a hundred and fifty million people did not over-awe this leader of a minority party. For him seizure of power was "as easy as lifting a feather", the establishment of a socialist state and administering it a matter of detail. He set up the dictatorship of the proletariat in place of the Tsarist military-bureaucratic dictatorship.

Began the phase of socialist nation-building. But in launching forth into this mighty endeavour, for which history held out no guiding hand, Lenin did not entirely disown the past. What was good in the old order which lay a shambles, Lenin took over.

Passionate pursuit of a great cause does not breed fanaticism; nor does true socialist nationalism beget chauvinism. This Lenin testified to in the national and international policies he evolved

The Treaty of Brest-Litovsk cost the Soviet Union much territory. But that was the old nationalist view. In the new order ushered in by Lenin there was no boohoo over the treaty.

LENIN BURST upon the rest of the world like a tornado. Never before in history has a political leader produced such global response and repercussion as Lenin did. To the capitalist world he was a caliban; to the colonial people, an epiphany. Promptly the imperialists threw the *cordon sanitaire.* That did not prevent the magnetic field of Leninism from operating. Sansculottes the world over rallied under the banner of socialism. Communist parties blossomed out in almost every quarter of the world where there was a politically conscious section The subject people in the colonies and dependencies saw in Lenin and his new Society a new hope for their freedom—and a "freedom" which was acquiring a new meaning.

THE WORLD revolution, of which Lenin considered his own to be a part, is yet to be. To that extent, he has been a pipe dreamer, say his antagonists. But even they cannot gloss over a fact of current history. When Lenin proclaimed the first socialist state, only a sixth of the world's population came under socialism. Today socialism is a world force. Under the irresistible impact of scientific and technological forces which control the modern industrial state, capitalism and communism will eventually coalesce to form a new society blending personal freedom and profit motive with the socialist system's government control of the economy. To Lenin and the state he founded belong a major share of the compulsions which thus humanised capitalism.

But the splintering of the once monolithic international communism has made the validity of the

Marxist-Leninst assertions that a socialist world will assure peace and prosperity to mankind look rather suspect. The Third International has gone to pieces. The days of the Second International are back It would thus appear that Lenin's fulminations against the latter resulted from an underestimate of the force of nationalism. However for 43 years, from 1917, Lenin held the field. Even now, all shades of communists never cease saying, "Comrade Lenin, we stand by you". That they still rally under Lenin's banner gives a measure of the universal Ilych. Or are they merely iconising him ?

Is God in Church Alone ?

FIFTY YEARS ago Jawaharlal Nehru wrote of the first ten momentous days of the October Revolution. "Within a week", he said, "they had tackled the problem of minorities, which, like the poor, is always with us in India".

If Lenin could do so, it was largely because he had, in every detail, thought out the course of action immediately after the day of victory which, he was sure, was coming On minorities and language, his views were unambiguous. He said :

"What does a compulsory official language mean ? In practice, it means that the language of the Great Russians, who are a *minority* of the population of Russia, is imposed upon all the rest of the population of Russia. In every school the teaching of the official language must be *obligatory*. All official correspondence must be conducted in the official language, not in the language of the local population...

"We do not want to have people driven into paradise with a cudgel, for no matter how many fine phrases about 'culture' you may utter, *compulsory* official language involves coercion, the use of the cudgel.. People whose conditions of life and work make it necessary for them to know the Russian language will learn it without being forced to do so. But coercion (the cudgel) will have only one result ; it will hinder the great and mighty Russian language from spreading to other national groups, and, most important of all, it will sharpen antagonism, cause friction in a million new forms, increase resentment, mutual misunderstanding, and so on.

"Who wants that sort of thing ? Not the Russian people not the Russian democrats. They do not recognise national oppression *in any form*, even in the interests of Russian culture and statehood."

LIKE THE DECREES on peace and land, the ideas of the Soviet Revolution were based on a certain philosophy with which one might or might not agree. In fact the bulk of the national leadership in India—Gandhi and Nehru, for instance—rejected the Soviet method and even many of the ideas of the revolution. But there was an effort to understand these ideas. Thus Nehru wrote in 1927 or 1928 :

"The main characteristic of the Soviet system is its open recognition of the fact that society consists of different social groups or classes, each with different economic interests. So long as this condition lasts, every government must express the relative importance and strength of these social classes. The long course of history is interpreted as a conflict between these different social groups or classes. We thus have what is called the economic interpretation of history, or historical materialism. In each historic period, we are told, there is a dominating class and the interests of other classes are only considered insofar as they serve to prolong or strengthen this domination. But this domination of one class over the others is seldom, if ever, clearly and openly expressed in the form of government. It is disguised in various ways to delude those who are exploited by it, and, where changes are slow, the dominating class creates an impression of eternal rights and duties, to safeguard its own interests".

ARISING FROM these formulations was Lenin's approach to economic issues. Of interest to Indian students of current affairs is what he had written of bank nationalisation :

"The banks are the ganglions of modern economic life, the principal nerve centres of the whole capitalist economic system. To talk about 'regulating economic life' and at the same time to evade the question of the nationalisation of the banks is either to betray the most profound ignorance or to deceive the 'common people' by florid words and grandiloquent promises with the deliberate intention of not fulfilling these promises

"It is utterly absurd to control and regulate deliveries of grain, or the production and distribution of goods generally, without controlling and regulating bank operations. It is like trying to save chance farthings and closing one's eyes to millions.

"As a matter of fact, the nationalisation of the banks, which would not deprive a single 'owner' of a single farthing presents absolutely no technical or cultural difficulties whatsoever, and is being delayed *exclusively* because of the vile greed of an insignificant handful of rich men."

The way Lenin looked at it was that if he was to succeed, he should accomplish his economic goals quickly. Nehru once said, "They (the Soviet leaders) had time, even on the fourth day of the Revolution, with firing going on in the streets, to establish the eight-hour day for workers and formulate their policy for a system of popular education.

RABINDRANATH TAGORE could see why the Russians were in a hurry. Writing in September 1930 he said :

"I am now in Russia ; had I not come, my life's pilgrimage would have remained incomplete. Before it is time to assess good and evil in their activities here, the first thing that occurs to me is : What incredible courage."

"What has astonished me most is the tremendous task that is being carried out here. Had it been merely a colossal destruction I would not have been so greatly surprised, because they can cause enough trouble if they want to, but I can see that they are determined to raise a new world. They have no time to lose, because the whole world is their opponent, they must prove without delay that what they want is not wrong and that it is no fraud ; a decade or two is determined to prevail against a millenium."

The poet further says :

"What has pleased me most here is the complete disappearance of the vulgar conceit of wealth. For this reason alone the self-respect of the people has been restored ; peasants and workers have all shaken

off the load of disrespect and raised their head. How wonderfully easy has become man's relation with his fellows!"

"If I had not seen with my own eyes, I could never have believed that even within ten years' time, lakhs of people sunk in ignorance and humiliation, could not only be made literate but given the dignity of manhood. Here they exert themselves as much for all other races as for their own. And yet men of communal religion call them irreligious. Is religion then to be found only in religious texts, and is God confined to the precincts of church and temple? Do they ever have God with them who continually cheat mankind?"

"Lest Lenin be Falsified by Tinsel Beauty"

Time, speed on, spread Lenin's slogans in your whirl!
I fear these eulogies line upon line
Like a boy fears falsehood and delusion.
They'll rig up an aura round any head;
The very idea—I abhor it,
That such a halo poetry-bred
Should hide Lenin's real, huge, human forehead
I'm anxious lest rituals, mausoleums and processions,
The honeyed incense of homage and publicity
Should obscure Lenin's essential simplicity.
I shudder as I would for the apple of my eye
Lest Lenin be falsified by tinsel beauty

Write! — votes my heart,
Commissioned by the mandate of duty
I knew a worker—he was illiterate—
Hadn't even tasted the alphabet's salt,
Yet he had listened to a speech by Lenin.
And so knew all.
I remember a story by Siberian peasants
They'd seized land, held it and worked it into very heaven.
I've been up mountains—not a lichen on their sides.
Just clouds lying prone on a rocky ledge.
The one living soul for hundreds of miles
Was a herdman resplendent with Lenin's badge.
Some'll call it a hankering for pins
Fit for girls—makes a frock look a bit more rich
But that pin'll scorch through shirts and skins,
To the hearts brimful of devotion of Ilyich
This couldn't be explained by churchmen's hooks and crooks;
No God Almighty bade him be a saviour
Working step by step his way through life and books,
He grew to be the teacher of world labour.

—MAYAKOVSKY

A New Society

"The Provisional Government has been deposed. State power has passed into the hands of the organ of the Petrograd Soviet of Workers' and Soldiers' Deputies—the Revolutionary Military Committee, which heads the Petrograd proletariat and the garrison.

The cause for which the people have fought, namely, the immediate offer of a democratic peace, the abolition of landed proprietorship, workers' control over production, and the establishment of Soviet power—this cause has been secured.

The workers' and peasants' revolution, about the necessity of which the Bolsheviks have always spoken, has been accomplished.

"By a just or democratic peace, the Government means an immediate peace without annexations (i.e. without the seizure of foreign lands, without the forcible incorporation of foreign nations) and without indemnities . . .

"The government considers it the greatest of crimes against humanity to continue this war over the issue of how to divide among the strong and rich nations the weak nationalities they have conquered.

"The government abolishes secret diplomacy, and, for its part, announces its firm intention to conduct all negotiations quite openly in full view of the whole people. It will proceed immediately with the full publication of the secret treaties enforced or concluded by the government of landowners and capitalists from February to November 7, 1917. The government proclaims the unconditional and immediate annulment of everything contained in these secret treaties insofar as it is aimed, as is mostly the case, at securing advantages and privileges for the Russion landowners and capitalists and at the retention, or extension, of the annexations made by the Great Russians."

"Landed proprietorship is abolished forthwith without any compensation.

"The landed estates, as also all crown, monastery, and church lands, with all their livestock, implements, buildings and everything pertaining thereto, shall be placed at the disposal of the *volost* land committees and the *uyezd* soviets of peasants' deputies pending the convocation of the constituent assembly."

THE WONDER GROWS

Today, ten years after the first world war, how far we are from an open diplomacy can be seen from the recent secret Anglo-French naval pact. But Russia has survived because she had the 'voices of humanity' with her . .

And as one reads, with horror and pain at times, the wonder grows that such a miracle could have happened and succeeded. And above all there is admiration for the group of men who did not flinch at the mightiest of obstacles, and in the midst of war and rebellion, with a cruel death and disaster continually facing them, sat down to evolve a socialist order out of the chaos that surrounded them.

—Jawaharlal Nehru

The art that flourishes on the Russian stage displays ceaseless courage of new creation. This daring of new creation too is active in their social revolution. In society, politics, art, nowhere have they feared the new.

—Rabindranath Tagore

Gandhi and Nehru on Lenin

I must confess that I have not yet been able to fully understand the meaning of Bolshevism. All that I know is that it aims at the abolition of the institution of private property. This is only an application of the ethical ideal of non-possession in the realm of economics and, if the people adopted this idea of their own accord or could be made to accept it by means of peaceful persuasion, there would be nothing like it.

But from what I know of Bolshevism, it not only does not preclude the use of force, but freely sanctions it for the expropriation of private property and maintaining the collective state ownership of the same. And if that is so, I have no hesitation in saying that the Bolshevik regime in its present form cannot last for long. For it is my firm conviction that nothing enduring can be built on violence.

But, be that as it may, there is no questioning the fact that the Bolshevik idea has behind it the purest sacrifice of countless men and women who have given up their all for its sake; and an ideal that is sanctified by the sacrifices of such master spirits as Lenin cannot go in vain; the noble example of their renunciation will be emblazoned for ever and quicken and purify the ideal as time passes.

Mahatma Gandhi

'I know a pair of eyes which have been for ever numbed by the burning sorrow of the Terror', said Gorky of Lenin. This sorrow did not leave him to the end. It made him a fierce fanatic and gave him the strength of will to persevere and achieve. But sorrow for the misery of his fellowmen did not make him gloomy or reserved. He was 'filled to the brim with the sap of life' and even 'in the unhappiest moments of his existence, he was serene and always prone to gay laughter' ..

During the critical days of 1921 when Moscow itself was threatened by the enemy and most people thought that the Soviet power was going to collapse, Lenin thought of the introduction of electric light in the villages and issued an ordinance for the immediate supply of electric light to certain areas...

By amazing power of will he hypnotised a nation and filled a disunited and demoralised people with energy and determination and the strength to endure and suffer for a cause...

And we may well say with Romain Rolland that Lenin was the 'greatest man of action in our century, and at the same time the most selfless'.

Lenin has become a mighty tradition, not only in his native Russia but in the world at large. As time passes he grows greater; he has become one of the chosen company of the world's immortals. Petrograd has become Leningrad, and almost every house in Russia has a Lenin corner or a Lenin picture. But he lives, not in monuments or pictures, but in the mighty work he did, and in the hearts of hundreds of millions of workers today who find inspiration in his example, and the hope of better day..

While the rest of the world was in the grip of the depression and going backwards in some ways, in the Soviet country, a great new world was being built up before our eyes. Russia, following the great Lenin, looked into the future and thought only of what was to be, while other countries lay numbed under the dead hand of the past and spend their energy in preserving the useless relics of a bygone age.

Jawaharlal Nehru

The revolution in Russia was regarded in India as a triumph over despotism . . It has given an impetus to Indian political aspirations.

Montagu-Chelmsford Report

H. G. Wells was, as he himself said, "disposed to be hostile to Lenin " when he set off to see him in the Kremlin in autumn 1920. Afterwards he wrote that his meeting with "this amazing little man, with his frank admission of the immensity and complication of the project of communism and his simple concentration upon its realisation, was very refershing. He at least has a vision of a world changed over and planned and built afresh."

On Language, Journalism, Human Relations and Classes

The Russian Marxists say that what is necessary is : the *absence* of an obligatory state language, the population being provided with schools where classes are conducted in all the local languages, and the constitution to include a basic law annulling all and sundry privileges for any nation and any restrictions of the rights of the national minority.

A democratic state must recognise unconditionally *full freedom* for different languages and reject all privileges for any one language

The role of a newspaper is not limited solely to the dissemination of ideas, to political education, and to the enlistment of Political allies A newspaper is not only a *collective* propagandist and a *collective* agitator, it is also a *collective* organiser

On the development of the productive forces depend the relations into which men enter with one another in the production of things required for the satisfaction of human needs. And in these relations lie the explanations of all the phenomena of social life, human aspirations, ideas and law. . .

The abolition of classes means placing all citizens on an equal footing with regard to the means of production belonging to society as a whole. It is absurd to expect equality of strength and abilities in socialist society

—**Lenin**

* *

Although freedom for individuals is now relatively less important than it was in former times, it is still much more important than many people realise Buddhism, Christianity and Marxism owe their origin to individuals and no one of them could have arisen in a totalitarian state.

SIDE TRACK

The Relevance of Junius

—*SANJAYA*

A.G. NOORANI has rendered as much service as anyone else and much more in the cause of democracy in its deepest sense. It is doubtful, however, if any of his writings is of greater value than his quotations from Burke's indictment of Warren Hastings and from the "unsurpassed invectives" of Junius who concealed his identity not only in his life time but ever after. For more than two centuries since he wrote his first letter in *Public Advertiser* on January 21, 1769, his identity has remained a mystery.

Of the excerpts from Junius quoted by Noorani, here is a choice one : "Let me exhort and conjure you never to suffer an invasion of your political constitution, however minute the instance may appear, to pass by without a determined, persevering resistance. One precedent creates another. They soon accumulate and constitute law. What yesterday was fact, today, is doctrine. Examples are supposed to justify the most dangerous measures; and where they do not suit exactly, the defect is supplied by analogy. Be assured that the laws which protect us in our civil rights grow out of the constitution and they must fall or flourish with it". Again · "Let it be impressed upon your minds, let it be instilled into your children that the liberty of the press is the palladium of all the civil, political and religious rights of an Englishman "

Relative Supremacy of Legislature

Noorani's choice of the following quotation from Junius is particularly appropriate : "When we say that the legislature is supreme we mean that it is the highest power known to the constitution; that it is the highest in comparison with other subordinate powers established by the laws. In this sense, the word 'supreme' is relative, not absolute. The power of the legislature is limited, not only by the general rules of natural justice and the welfare of the community, but by the forms and principles of our particular constitution". And : "We betray ourselves, we contradict the spirit of our laws and we shake the whole system of English jurisprudence, whenever we entrust a discretionary power over the life, liberty or fortune of the subject, to any man or act of men whatever, upon a presumption that it will not be abused". Further : "We can never be really in danger until the forms of Parliament are made use of to destroy the substance of our civil and political liberties, until Parliament itself betrays its trust by contributing to establish new principles of government and employing the very weapons committed to it by the collective body to stab the constitution".

Blackstone, a respected name and a great writer on the laws of England, after his arguments, as Solicitor-General, in the Wilkc case, had this said of him by Junius : "Dr. Blackstone is solicitor to the Queen. The doctor recollected that he had a place to preserve, though he forgot that he had a reputation to lose. We have now the good fortune to understand the doctor's principles as well as writings. For the defence of truth, of law and reason, the doctor's book may be safely consulted. But whoever wishes to cheat a neighbour of his estate, or to rob a country of its rights, need make no scruple of consulting the doctor himself".

No Shadow Boxing

Noorani mentions that, when reproached for the personal attack, Junius hit back, "To attack vices in the abstract, without touching persons, may be safe fighting, indeed ; but it is fighting with shadows. My greatest comfort and encouragement to proceed has been to see that those who have no shame and no fear of anything else have appeared touched by my satires".

And so to a Duke : "The character of the reputed ancestors of some men has made it possible for the descendents to be vicious in the extreme, without being degenerate. Those of Your Grace, for instance, left no distressing examples of virtue, even to their legitimate posterity; and you may look back with pleasure to an illustrious pedigree in which heraldry has not left a single good quality upon record to insult or upbraid you. You have better proofs of your descent, My Lord, than the register of a marriage or any troublesome inheritance of reputation . . . Charles the First lived and died a hypocrite. Charles the Second was a hypocrite of another sort, and should have died upon the same scaffold. At the distance of a century, we see their different characters happily revived and blended in Your Grace . . . You live like Charles the Second without being an amiable companion; and for aught I know, may die as his father did, without the reputation of a martyr".

What of tyrants and their follies? Here is an excerpt from Junius quoted by Noorani : "If nature had given you an understanding qualified to keep pace with the wishes and principles of your heart, she would have made you, perhaps, the most formidable minister that ever was employed to accomplish the ruin of a free people When neither the feelings of shame, the reproaches of conscience, nor the dread of punishment form any bar to the designs of a minister, the people would have too much reason to lament their condition, if they did not find some resource in the weakness of his understanding. We owe it to the bounty of providence that the completest depravity of the heart is sometimes strangely united with a confusion of the mind; which counteracts the most favourite principles and makes the same men treacherous without art, and a hypocrite without deceiving."

And what a relentless tragedy pursues a fallen tyrant ! Noorani quotes Junius : "I fear you have listened too long to the advice of those pernicious friends with whose interests you have sordidly united your own and for whom you have sacrificed everything that ought to be dear to a man of honour. They are still base enough to encourage the follies of your age, as they once did the vices of your youth. As little acquainted with the rules of decorum as with the laws of morality, they will not suffer you to profit by experience nor even to consult the propriety of a bad character Even now they tell you that life is no more than a dramatic scene in which the hero should preserve his consistency to the last; and that, as you lived without virtue, you should die without repentence."

And this was written two hundred years ago.

A New Approach to Planning

The following are extracts from the remarks made during a radio discussion by **Prof. Raj Krishna** *Member of the Planning Commission.*

I THINK basically there are only two decisions One is that Fifth Five Year Plan will be formally terminated on the 31st March next year and the other is that from the 1st April, 1978 we go on to a rolling plan system under which the span of projections will still be five years but this five year projection will be revised every year.

I think the basic inspiration behind the change is that these five year projections in the past used to become rigid and out of line with reality; demand projections proved to be wrong on the high side or on the low side and our economy is always subject to shocks from the weather, from the shortage of foreign exchange, from unexpected rates of inflation and now foreign exchange surpluses. Therefore, the economy needs more flexibility in its projection work from year to year and this is the inspiration for revising the projections to the minimum essential extent necessary every year

In the annual plan procedure a large number of demand projections still remained rigid because a new look on all projections was never made every year.

Now I think it will be very wrong to get the impression that flexibility means that every single demand projection, every single financial commitment, every single project in the shelf is going to be revised every year That could be a wrong interpretation of the rolling plan idea The idea is simply that some projection should be revised and as regards the horizon I would say that there is no technological constancy about demand projections for different sectors In fact I would say that for certain sectors, the stable horizon may be even longer than five years And the rolling plan idea does not imply that perspective projections for 10 or 15 or 20 years for fundamental sectors will not continue to be valid unless there is a very very strong reason to revise any of those projections So I want to stress that in practice only a minority of projections, projects and financial commitments may be revised, even under the rolling plan procedure.

The rolling plan will be made by the Planning Commission and my understanding is that the requirement will be as now that the non-plan expenditure and the plan expenditure for every financial year is decided together. And there will be no difference in this understanding The only requirement on the Planning Commission's part will be that the immediately following year's content of the rolling plan should be ready early so that the Finance Ministry's presentation for the non-plan outlay and our projections of the plan outlay agreed with the Finance Ministry are presented together in a consolidated form as now

Relative Emphasis

I think there is one more thing between objectives and what you call policies and that is the relative emphasis given to different objectives I would stress that it is quite clear that in regard to the objective of self-reliance the country can boast of sufficient success in building a capital goods base and a technological base. In regard to the objective of growth we can certainly talk about three to three and a half per cent growth which we have achieved But it is also clear that in regard to the objectives of distributive justice and employment our planning system has not succeeded overmuch Therefore, it seems to me that what is happening is that, having achieved substantial success on the self-reliance front and some success on the growth front, a greater breakthrough on the employment front and distributive justice front is now overdue It is overdue not only because these objectives are not being realised—unemployment problem is increasing—but because of the objective reality that the modern industrial structure now faces a demand problem which cannot be solved without an injection of purchasing power at the bottom

So far as the Planning Commission is concerned, employment generation will be related either to assets creation or to production. There is nothing on the cards which will create employment without these things, namely, production or assets creation. I may add that the strategy of the planning methodology now is to calculate carefully the employment content of alternative investment allocations and choose the allocation which, while satisfying certain norms of productivity and resource availability, subject to those constraints, increases the employment content. One of the simple complaints against the previous planning process was that the employment content in detail in terms of input-output sector was not even calculated or if it was calculated it was not presented. Increasing the employment content of investment allocation is one approach. The second approach is that since mere sector planning can leave large parts of the country still suffering from very chronic unemployment and poverty, in such areas sector planning will have to be supplemented by direct area planning. So it is a twofold movement of maximising the employment content of investment allocation and supplementary area planning in areas infested with very heavy unemployment rates of the order of ten per cent and very heavy poverty that we are trying to follow.

I think the roles are clearly settled The non-plan outlay is definitely allocated by the Finance Ministry, investment outlays on new schemes are decided by the Planning Commission and this division of labour is likely to continue. There is a logical question which we should face pretty soon, that in certain sectors like health and education, the distinction between assets creation and continuation of activities is a thin one and we have already been thinking of finding a mechanism whereby the allocation of non-plan and plan outlay, investment consumption outlay in some such grave sectors is jointly made by the concerned agencies.

No one in the Planning Commission takes the view that the demand problem equally affects the whole industrial structure. In fact I would go further and say that a part of the idle capacity, say in the capital goods sector, is simply due to the fact that public investment is decelerated Therefore, if infrastructure and social service growth is accelerated again, this sector should have larger demand. Then there is a

part of the consumer goods large scale sector which is not suffering from the demand problem. But there is a part which is suffering and there is a part of the capital goods sector—engineering industries and textile machinery—which is suffering from a demand problem because their final products, certain varieties of fine cloth are suffering from a demand problem. The demand problem is desegregated and the approaches to the solution of the demand problem proposed by us will be desegregated.

Foreign Capital

In our democratic system a lot more appears in the press than is really happening. So far as the Planning Commission is concerned I can only say that no hard projects have yet been received by us for consideration involving substantial amounts of large foreign capital, though press reports have been appearing. If and when we do receive some hard proposals, carefully worked out, we would raise the question of self-reliance, the question of the balance between foreign and domestic resources, the terms of foreign collaboration, the question of depletion and depletable resources, the employment content of those projects. Therefore, I think it is premature to assume that hard projects of this kind already exist and are under active consideration I think the press has been having more of loud thinking on this subject or some people have been having loud thinking but we have not come across hard proposals and if hard proposals come, the Planning Commission will not fail to raise all the hard questions.

Let me talk a little bit about the novelties. One of those things will be an escalation of the irrigation programme which is a key to agricultural growth and indirectly for industrial growth The second thing will be not that one textile industry or any other industry—at least as far as the Planning Commission is concerned will be closed down or not considered at all. But in general terms I would say that in all industries with a mass employment potential a question has certainly arisen about the distribution of new capacity between multiple techniques which co-exist. And, therefore, the Planning Commission is certainly working in collaboration with the concerned ministries about the ratios in which new capacity or new output may be allocated between multiple techniques in a few selected industries where the actual or the potential employment is very high. This distribution will still be subject to cost considerations but also subject to employment constraints. In an economy like ours, if we only minimise cost we do not create sufficient employment. On the other hand if you only worry about employment, the cost differences may be three hundred to four hundred per cent. So the technical work that is going on is to optimise with this joint constraint of cost minimisation subject to certain employment goals.

Land Ownership

The Planning Commission certainly continues to be obsessed and will continue to be obsessed and I am certainly obsessed with the need to change the structure of land ownership for its own sake and for the sake of efficiency of the irrigation capacity that we create In many parts of the country we cannot really get even minimum utilisation of water without realignment of holdings But I would add at the same time that while the structure of ownerships is being changed, it is possible to change the distribution of non-land inputs. Every one of the non-land inputs which the state agencies provide namely credit, fertiliser, the location of tubewells, the sale of water, the ownership of tubewells can be rigged systematically in favour of the small man. Therefore, I would say that we are thinking in terms of a twofold strategy. In the short and medium term and as the land ownership reforms are going on we will work harder on the redistribution of non-land inputs which can jack up incomes above the poverty line in a very short time. Some of the agencies are doing this in parts of the country.

Irrigation programmes are not defined unless you say who is going to benefit from irrigation. We are changing the balance between minor and major irrigation, we are proposing to change the balance even in the location of small scale outlets in favour of smaller people.

Hard Consultation

It is not true that there will be no policy frame. I think the numbers mean nothing without a policy frame and all the time we are doing as much work on the policy frame, as on the numbers And the degree of reality of those policy frame discussions will come from the fact that policy proposals will be made in hard consultations with the concerned agencies before we put out draft □

ROLLING PLAN

Chance for Basic Changes in Attitudes

Dr V Shanmugasundaram

THE masses as well as scholars in economics are now doubtless in the position of Alice in Wonderland or curiosity My good friends Prof Raj Krishna, Dr. Lakdawala and others evoke my appreciation on two counts It is not easy for an economist to sell a technical idea to his political boss Secondly a new government elected in a mass upsurge ought not to leave so comprehensive, so broad an economic platform as the Planning Commission, without any new major breakthrough which indeed is the concept of rolling plan.

But one should not be carried off his feet without recognising its pros and cons High expectations were raised, when Pandit Nehru, was advised by Prof. K T. Shah and others, during the 1930s or still earlier when Sir M. Visweswariah originated the concept of district planning and more dramatically still when the Planning Commission was established in 1950s But we know how false they turned out to be After three decades of planning in this country, we are looking for lame excuses and trumped up statistics to explain away stark poverty, increasing inequality and depradation So some people bemoan that the sacred cow, namely, the five year plan, is not sufficiently worshipped now. The cause should be best known to them. A comment was made by the former Prime Minister, that the abandonment of the five year plan amounts to making planning in India directionless. If the import is that the Soviet kind of rigid five year plan is abandoned,

it will not hold much water. The first plan was implemented for several years, before the document was made known by Pandit Nehru. Before the mouse of the fifth plan was let loose in a brief document a spell of a few ad hoc annual plans took place and a political denial of plan holidays was made. The Soviets have already started on ten year and fifteen year plans and the Soviet people now provide as many tons of foodgrains as there are people. After almost five year plans we are providing only hundred million tons food for 600 million people, a sixth of what is given to the people of the USSR or the USA

Irrelevance of Foreign Models

It is time we stopped quoting or following out of context international slogans or else we would soon end up looking for international experts to defend Valluvar's *Kural* in Tamil Nadu or Tulsi's *Ramayana* in the Hindi belt. I am equally surprised that the new planners have cited European experience in support of the concept of rolling plan This is giving a wrong defence of the document To be precise, on 22nd March 1974 the State Planning Commission of Tamilnadu gave its Chairman Dr. M Karunanidhi a ten year perspective plan covering the period up to 1983-84. It was a plan drawn by economists, industrialists and a civil servant of the status of Chief Secretary. Tamilnadu has thus already stolen the thunder and let us not hide this historical fact and distort it in respect of the importance of rolling plan in India If the federal idea of decentralised economic planning is the spirit which really underlines the Janata policy, they could well have called this a Tamilnadu strategy of rolling plan. This is Indianness in social science practice. Similarly the Planning Commission at Delhi could benefit by the West Bengal theory of financial decentralisation or the Maharashtra strategy of employment guarantee or the Punjab policy of agricultural entrepreneurship Let us stop defending and quoting irrelevant international models, unless it be for calculated political gains. The Swedish long term budgetting, the British practice of presenting a white paper along with the annual budget, Pakistan's seven year plan, the Russian five year, ten year or twenty year plans are not quite relevant to the Indian context. In which country do we have five million educated people awaiting jobs ? In which country are the wage differences between rural and urban areas in the ratio of 1 : 5 or 1 : 10 ? How can we think of international models when our health and sanitary cultures are dualistic—one which is meant for ultra modern people and the other which is meant for the poor and the weak.

Refinement of Long-term Plan

A rolling plan is not a negation of a five year plan or a ten year perspective plan. It is a refinement of a long term plan. Even a supersonic flight from Delhi to Moscow or New York, however pre-determined it be, is subject to dexterous manoeuvring of the pilot. In Indian planning we have accepted annual plans as intermediate points But what has happened ? Our targets were often dreamy. A plan grant supposed to be discretionary has become the substantial force in union-state planning relations As against a finance commission transfer of about eight hundred crore rupees, the discretionary planning commission grants and loans have assumed a magnitude of Rs one thousand crore in the early 1970s Consequently, planning by the Government of India has become a main instrument to threaten and strike fear in the machinery of state governments—virtually an economic instrument of political compulsions. My fear is whether the rolling plan would become one more monstrosity in union-state economic relations Let us consider the size of Andhra Pradesh or of Punjab In population several European countries are much smaller than each of them Whether it is an elementary school, a primary health centre or a college, the five year plans seem to have a very big say. This is bad enough as it is The fear is whether the rolling plan would make it even worse There was a time in Indian history when the voice of a British Resident in a princely state was considered to be a thunder Till recently, a whisper in the corridors of the Planning Commission has been more than a thunder in the economic departments of state governments. This position must change under the rolling plan.

Imperial Delhi

In respect of food production, groundnut, sugarcane etc our five year plans have not realised the targets. It looks as though we should think in terms of contiguous zones so that they could organise this planning strategy. For example, Tamilnadu, Karnataka, Kerala and Andhra could have power, water and agricultural land use. The suggestion of rolling plan implies that in unforeseen contingencies the economic plan will be properly adjusted and updated. Another requirement is that the imperial administration in Delhi has grown to such an extent that it needs to be dismantled With the modern instruments of technology like the telephone, airways, and the like, those in power in the centralised government of India could be more ruthless than the most powerful emperors in the past, British or Indian We have tasted it and suffered recently

If after what has been heralded as a second war of Indian independence, the non-congress wave has created new governments at Delhi and in state capitals the rolling plan should mean something of a new hope The aims like full employment, doubling per capita real income, ensuring social justice, decentralised planning and resource mobilisation, social change for economic development and promotion of cultural activities should be pursued steadfastly and not left to the whims and fancies of the annual rolling plan strategy.

Rolling plan has been caricatured by our esteemed friend Abu. the cartoonist, with our planners struggling to be stable on a fast moving roller. The maintenance of equilibrium between supply and demand, increasing wage claims by workers on the one hand and increasing prices demand by farmers on the other. Clamour for prestige oriented education and inadequate work force for reconstruction activities, are some of the forces in the opposite direction requiring reconciliation. Thus planning is tantamount to balancing on a roller The task is not easy To be efficient it requires better skills.

Monitoring

There is now emphasis on monitoring Let us not make a mockery of monitoring. We should have sufficiently independent and technocratic bodies which can render monitoring that is reliable. Independent agencies have often given in the past a truthful picture of our food production, whereas official statistics exaggerated it. Our demand for fertiliser estimated at four million tonnes, some thirty years ago, is still to be realised even up to fifty per cent. Our neighbour China has demonstrated a high degree of social and econo-

mic equality and in contrast the inequality is increasing in our country.

We have talked of self-sufficiency. But we are now the biggest seekers of aid abroad. Our output of plan literature is perhaps the largest in the world But the economic growth rate has been declining continuously. We have blamed the bureaucrats. But have we not placed on their shoulders far more responsibilities, often conflicting.

MULTI-LEVEL

I trust that the rolling plan implies a reassessment of the total provision and our external resources and the continuously changing situation at the district and block level We must study the saving rate, we must study also the rate at which we have to increase our real income and ensure full employment in urban and rural areas These aims should not be subject to rolling, faltering or rethinking A successful commander knows when to withdraw. But that is always occasional and rare. Even so, the annual rolling plan should be restricted to a few issues Planning at the grass root level means planning at the smallest micro-level and, therefore, it is necessary for us to take in the task of multi-level planning. Among all the vested interests, the worst is the wrong idea. If rolling plan means a technique of evading the tasks of reaching social goals and economic justice to the poor and causing uncertainty it is not welcome On the contrary if we could take it as one more scientific step to make planning decentralised and therefore, easy for effective implementation and monitoring for annual revision, we welcome it

FEDERAL POLICY

Economic planning in the new set up should grapple with different political party programmes We have today governments and political parties in different parts of India. Antony of Kerala, M G.R of Tamil Nadu and Jyoti Basu of West Bengal would like to have specific emphasis on the plan programmes and this must be conceded in the rolling plan. An inter-state organisation representing different state governments should monitor the public expenditure of the Government of India and its fiscal management. This has evaded attention for a long time and the Finance Commission that is now functioning must take note of it. Article 282 of the Constitution states that the Union or a state may make any grants for any public purpose, notwithstanding that the purpose is not one with respect to which Parliament or the legislature of the state as the case may be, may make laws This has caused chaos in the past. Let us put an end to it

Statistics has been quoted to show that some high targets have not yet been realised. Recently Prof. Raj Krishna also referred to it. I hope he does not mean by this that the targets will be downgraded. Our steel output of eight million tonnes should be contrasted with 140 million tonnes in Japan, with much smaller manpower and iron ore resources Small indeed was our coal target of 135 million tonnes in the Fifth Plan, but it was reduced further to 124 million tonnes By lowering of targets how can we turn the corner in respect of thermal energy needs ?

Capital is so scarce that we have to maintain it with considerable care. The rolling plan should take particular note of this.

Our Prime Minister is keen on enforcing prohibition. We know that in Gujarat and Tamilnadu for nearly 30 years, we have followed this policy, and each has lost nearly Rs. eight hundred to thousand crore in this period.

NEED FOR NEW PRECEDENTS

The Prime Minister is shortly scheduled to consult State Chief Ministers. It would be a welcome step in the right direction if new and healthy precedents are established by each of the spending departments of Government of India and of the state government in ensuring that there is fiscal discipline and good fiscal management There ought to be sufficient authority and certainty in respect of planning bodies in different parts of India within the framework of the five year or ten year plans and subject only to marginal changes in annual planning Let us not repeat the earlier mistakes. Our past annual plans meant horse-trading for political reasons and placing the poor man in jeopardy □

For a National Water Policy

C.C. PATEL

WATER, THOUGH abundant in nature and renewable, has a limited source. It has no substitute but its use can be optimised by resorting to latest technologies. It is here that engineers and experts have to use their ingenuity While our rivers carry about 1500 million acre feet of water, due to topographical and other limitations, present assessments place the utilisable flow at only about 540 million acre feet plus another 200 million acre feet from ground water. The present assessments are that the eventual irrigation potential may be 107 million hectares, or just about half of the cropped area in the country.

Apart from irrigation, water is also needed for domestic and industrial supply, for cooling of thermal stations, hydro-power generation, inland navigation, waste disposal, recreation and environment. There is also the need to control the destructive aspect of flow like flooding and drainage congestion.

The unequal distribution in space and time of the available water supplies poses problems which have to be faced and solved using the latest technologies Preservation of water quality and prevention of water pollution are other vital areas which have to be covered by policy directions

Before policies are formulated, a framework needs to be evolved to ensure that policies are not only most appropriate but are capable of being implemented speedily Wherever feasible, cooperative structures should be built up so that planning, implementation and operation of programmes necessary for water development and use, are prepared jointly whether they pertain to distribution of water or marketing or storage or even crop planning. Policy measures may advantageously include economic incentives so that more efficient units are rewarded. This would provide built-in correctives for maintaining desired balances. Suitable incentives would have to be given for accelerating the development of economically backward areas, including tribal areas. Also special priorities may have to be given for drought prone or desert areas. Representatives of the public have to be associated in decision-

making. Legislation should be resorted to more for keeping overall control and maintaining a climate in which deterioration can be held within certain limits.

Priorities of Use

A water policy has first to recognise the priorities for use. It has been universally recognised that no utility enjoys perpetual priority or preference and when circumstances change, priorities have to be reviewed. Even so, if planning has to be carried out for optimum use of the available resources, it is essential to lay down the priorities of use of water. Generally, water required for drinking and domestic uses has to be given the highest priority. The quantity of water required for this purpose is relatively small.

Next to this, water required for industrial use would generally enjoy priority. However, in water-short and drought-affected areas, certain minimum levels of irrigation may have to be given priority in order to stabilise the economy. As a policy, water intensive industries may have to be located in areas where water is available in plenty (taking into consideration sites for discharging of effluents and the treatment of effluents). Industries, on the other hand, particularly in water-short areas should be based on economic use of water and should resort to recycling of water wherever feasible The treatment of effluents should be such that it is possible to use that water, after dilution if necessary, for agricultural and other purposes

Next, irrigation generally enjoys priority as compared to water use for hydro-power generation, although, as far as possible, multi-purpose use of water should be planned, aiming at maximum use of water for both irrigation and hydro-power. Where, however, water is essentially required to meet reasonable and minimum requirements of irrigation and if it is not available in full or part for hydro-power generation, deletions or curtailments of hydro-power benefits become necessary. Usually, during the initial period of development of irrigation hydro-power benefits in a much larger measure are available and as irrigation develops, hydro-power plants generate less quantum of power but can continue to provide useful peaking capacity. This is a favourable feature and should be component of any policy decisions regarding water planning.

Generally, navigation, recreation, and development of fisheries form part of the multi-purpose development of water for drinking water supply, irrigation, flood control or hydro-power generation; and these incidental benefits require to be exploited to the maximum by resorting to such policies as will permit optimum use and prevent abuse of water. Some degree of control or legislation is called for to optimise the development of reservoirs and their shorelines for various purposes

Priorities assigned at one place may not necessarily hold good at another place. Similarly, in course of time, the priorities may have to be changed Water policy has, therefore, to be flexible and calls for periodic reviews

Systems Approach

Water being scarce and there being a number of competing demands on it, a number of alternative plans for development have to be examined. For this purpose, a systems approach should be resorted to and suitable methodologies evolved taking into consideration technical socio-economic, environmental and other considerations

The history of water development all over the world has shown that planning, which used to be confined to individual projects, gave way to the concept of river basin planning and then to regions and then to countries as a whole Planning on a national scale is inescapable if we have to aim at the balanced development of the various parts of the country. Any water policy has, therefore, to take into account the fact that there should be freedom to plan on the national and regional basis disregarding the political boundaries of the constituent units This naturally leads to the question of what the appropriate agency would be to prepare such plans In our country, in many instances, states plan development of waters without due regard to the needs of the other basin states For instance, a state may plan to use water for hydro-power generation by diverting it into a water surplus basin or to the sea. This may help the concerned state in providing cheap hydro power but this would deprive use of much needed water for agriculture and other purposes in other states. Similarly, a state may plan intensive irrigated agriculture which may not even fully materialise but which would restrict the use of water either within the state or beyond its boundaries.

One-third of the area in our country is drought-affected which presents major problems. The availability of water in most cases would ultimately decide the level to which these areas, particularly the rural ones, can develop their economy Removal of imbalances in the regional development has been one of the important objectives of the government. Backward and less fortunate areas have to be developed at a faster rate.

Planning of water resources, therefore, assumes great importance It has to be remembered that once major structures are built or water use is established, it is either not possible to change it or augment the benefit potential except at prohibitive costs.

This leads to the conclusion that the overall planning of the development of water resources has to be the responsibility of an agency which is not connected with any of the states. In other countries, organisations which are called by various names like river basin authorities or river basin commissions, attend to this task

States' Cooperation

As water is to be used in the states, the closest association of the states at the grassroot level is necessary so that the needs of every state and area are fully taken into consideration and the views of the states on planning are also given the fullest consideration while evolving plans for optimal harnessing of available waters.

In a number of cases storages are located in one state while the benefits accrue to the other The master plans for water development have to be drawn up basin-wise and have to take into consideration the needs of the entire region with due regard to the availability of water in the adjoining basins. There are only a few dam sites in the country which can provide economic storages and these must be exploited fully so that the available waters are harnessed to an optimum extent. For this purpose, some difficulties of submergence have to be faced by some states for the benefit of other states within the country. A certain amount of give and take, in such cases, may have to be inter-woven in a national water policy.

Conjunctive use of ground and surface water is necessary, not only for enhancing the quantum of

water available for use but also for minimising the hazards of inadequate drainage and water-logging. This however, involves higher costs of water lifts. But where it is possible to use surface water, the economic disadvantages to the exporting state in foregoing the benefits of relatively cheaper flow water may have to be compensated in some way. The compensation could be made either by the beneficiary state or by the centre or by both. It is also the general tendency among the states to reserve water for future uses and assessment of such reservations are almost invariably inflated As a result, water continues to run to the sea without being used by any of the states Such a situation can be effectively met if the water is allowed to be used for beneficial purposes and such allocations are reviewed within certain limits as future uses are developed Any state, which later has to forego the established use, should be willing to resort to some reduction which should be feasible of achievement. For instance, the states should be able to economise in the use of water in the state or take to costlier sources like ground water. Even otherwise, it may not be in the national interest to reserve water for a long-term future use which cannot be assessed with any accuracy at present and deprive the use of water in the near future by other areas A suitable policy may have to be laid down so that any such distress, if and when it occurs, is shared both by the area which enjoys the benefits at present and the area which has to forego the benefits in future

Ecological Aspects

While considering extra-basin diversion of water, any adverse environmental and ecological aspects of such diversion on the exporting basin should also be carefully taken into account. It has to be recognised that, when water is limited, it has to be supplied to such areas where it can bring maximum return to the country. Of course this principle cannot be extended too far because the other rural areas affected in the exporting basin may not have any alternative source of gainful employment. These are policy issues and for getting the best results, for certain areas, where the use of scarce water cannot bring optimum results, economic development will have to be mainly based on other resources

It also needs to be laid down that inefficient use of water cannot be allowed to continue, particularly when there is demand of the same for beneficial use elsewhere. The inefficiency will have to be eliminated by modernisation of existing systems, reduction of wastage and economy in water use, as well as optimum use of available water through changes in cropping pattern and conjunctive use of ground water

Norms for Intensive Irrigation

The question of an appropriate intensity of irrigation was considered by the irrigation commission and the national commission on agriculture and they have recommended certain norms for adoption. Where water is in plenty, its use should be aimed at maximum production per unit of area. Where the water resources available are insufficient to meet irrigation requirements of cultivated land, the policy should aim at securing maximum crop production per unit of water. Of course, the economies of irrigation have to be considered and a reasonable intensity must be permitted so that the cost effectiveness of the project is not affected. In drought affected areas, the emphasis should be on the maximum area served that is, the greatest good of the largest number should be ensured to the extent practicable. A policy in this regard is called for, which can only be decided after studying in detail the positions obtaining in various areas of the country

Even today the industrial effluents pose a significant threat to the established or prospective source of water supply The position in future can be worse While the water pollution control act has been passed and is being adopted by several states, it is essential to have a policy on a national basis which will create awareness of the urgent need for environmental preservation so that abuse of water is stopped and sweet water sources are protected from any type of pollution Monitoring of water quality at various locations is very important and this has to be introduced as soon as possible.

Case Studies

If a broad national policy is evolved which is supported by scientific assessment of representative case studies, it would help greatly in preparing master plans for optimum development of waters and many potential disputes could be nipped in the bud. However, there may still be situations when some disputes or differences might arise. These could be discussed at a national forum for finding amicable settlements safeguarding various interests.

In brief, a national water policy has to take into consideration the situations obtaining in different regions and evolve certain principles and guidelines, applicable under different conditions and promoting the exploitation and optimum use of water, which is increasingly becoming a scarce resource. The policy has to lay down norms for preservation and enhancing the value of waters and for creating better environment in general. Owing to many complex factors water policy cannot be laid down with precision in the immediate future but it has to evolve, after taking into consideration, precedents and future needs in consultation with the state governments. Further, such a policy cannot be static and permanent but has to be reviewed from time to time, and modified whenever necessary in the light of experience and emerging technological developments

Statement of Objectives

The need for a national water policy and integrated planning for water is universally recognised and a number of advanced countries have set up organisations at the national and regional levels for this purpose The U N. water conference, recently held in Argentina, has suggested that each country should formulate, and keep under review, a general statement of policy in relation to the use, management and conservation of water, as a framework for planning and implementing specific programmes and measures for efficient operation of schemes. National development plans and policies should specify the main objectives of water-use policy, which should in turn be translated into guidelines and strategies, sub-divided as far as possible, into programmes for the integrated management of the resource.

While we have considerable experience in building projects of unique scope and magnitude, we have lost sight of the need for involvement of the public in our projects. No project can succeed unless it meets the needs of the people and fulfils their felt wants. We have to think carefully and devise

measures for associating the beneficiaries from the planning stage and take their views into account.

ECONOMIC PROJECT FORMULATION

Requisite attention is not being paid to project formulation at present. The best talent available in the country has to be deployed for this task, as this is the stage at which real economies can be achieved by the selection of the most economical site, or the most appropriate type of structure, or the best technique of construction. Comprehensive data availability and the experience of other projects are invaluable in this connection. This expertise has to be preserved and expanded.

Our maintenance and operational aspects have not kept pace with the developments. There has been a veritable explosion in agriculture and it is necessary for irrigation systems to cater to these needs. In this context, a careful review of our existing schemes and streamlining their maintenance and operation procedures and their modification or modernisation to meet the needs of present-day agriculture, are extremely urgent. This inter-disciplinary task has to be given immediate attention, so that optimum use is made of the available waters and wastage/loss prevented.

There are a number of modern management techniques which should prove very useful in our construction works The unity of close monitoring of projects, cost control cells, scientific planning of inventories and stores and good communication facilities have been demonstrated in many advanced countries and we should make full use of these innovations □

A MINISTRY AND A BOARD FOR ROADS

Dr H C. MEHROTRA

AND

Dr D K KULSHRESTHA

IN TWENTYFIVE years since 1950-51 the total road length in the country increased three and a half times, 522,000 kms. of surfaced and 701,000 kms of unsurfaced roads. In terms of area and population the total road length in the country worked out to 29 8 kms for every 100 sq kms of area and 181 kms for every one lakh of population in 1969-70 By 1975-76 the length of pucca roads was 36 kms for every one lakh of population and 201 kms for every 100 sq kms of area. Still India is far behind other developing countries of the world. Maintenance is also poor, mainly because of responsibility being shared by many authorities like the public works departments, local bodies, canal departments and military engineering services. This also accounts for a number of uncompleted road links unbridged rivers and canals even on provincial roads and national highways.

Construction and maintenance of roads is a state subject. It is financed however, from the central road development fund, outlays fixed in five year plans, special grants from the central government for approved schemes. State governments and local bodies also contribute funds to an extent. All this is inadequate. The proportion of road expenditure to the road revenue has been as low as 30 to 40 per cent in the last decade In 1969-70 it was only 31 per cent as against 218 per cent in Japan, 140 per cent in Norway, 102 per cent in Germany, 73 per cent in Ceylon and 61 per cent in France In our country the percentage of road expenditure to national income is also the least being 0 63 against 3 5 in Canada, 2 8 in Japan; 2 3 in the U.S.A , 1 1 in France, 4 0 in Norway, 2.9 in Germany, 2 8 in Australia; 1 5 in U K.; and 0.96 in Ceylon.

Financial resources should be raised from betterment levy on the properties standing on road sides, whose rental value increases by the improvement of roads; allocation of cent per cent revenue derived from roads and road transport for road development; and interest free central government loans The Taxation Enquiry Commission 1953-54 suggested that 25 per cent of the levies on motor spirit and motor vehicles should be transferred to the state road funds and 25 per cent of the excise duty on motor vehicles and their components should be transferred to the rural communication funds This should be done There should also be provision in the defence budget for road construction and maintenance Further the chief engineers, while finalising the twenty year road development plan suggested a special land cess to accumulate funds for road development. This is being levied in many states like Andhra Pradesh, Bihar, Maharashtra, Punjab, and Tamil Nadu. It should be levied at a uniform rate in the country as a whole. Finally every effort should be made to cut down the cost of road construction and maintenance.

The Central Road Research Institute should take over road research work for the country as a whole and guide the research stations in the states A separate road research training centre should be set up to train road engineers and allied personnel

COORDINATION

There should be only one authority responsible for the construction and maintenance of roads throughout the country. If this is not possible, the state governments should be held responsible for all types of roads within their territories, while the National Highways should be under the charge of the Centre and no road should be left in the hands of the local bodies. Local administration of roads by village panchayats and blocks should be totally abolished as they are unable to provide adequate finance or to maintain highly qualified manpower and knowhow for road development and maintenance Coordination among all the states for road development and maintenance should be streamlined. A central road board with branches in all the states will serve useful purpose

The board should collect statistics for the country as a whole and chalk out long term road development programmes and its state offices should look after the roads within their jurisdiction

At present the road policy is determined by the roads wing of Union Ministry of Transport and Shipping A separate ministry for roads and road transport like the Ministry for Railways should be set up and separate road budgets should be prepared and placed before the Parliament

Road development priorities should be, in that order, maintenance of existing roads. conversion of fair weather roads into all weather roads, construction of new roads keeping in view the potential economic development of the country and qualitative improvements in existing road surfaces □

PLANNING FOR MEGHALAYA

A Himalayan Problem

Dr J. N. Mongia

THE EMERGENCE of hill areas as a distinct entity in the planning process, is a recent phenomenon The biggest problem for development planners in the terrain.

On a rough estimate, nearly five crore people or about eight per cent of India's population live in the hill areas Geographically, these areas cover about 5 14 lakh sq kms. which is nearly one-sixth of the country's area

All the hill areas in the country share, in varying degrees, an inherited back-log in industrial development and a vast and rich but unexploited mineral and forest resources Agriculture is steeped in traditional practices which vary from the method of shifting cultivation or 'jhum' to cultivation without the assistance of improved implements and agricultural inputs like seeds and fertilisers. The horticultural potential has developed in certain areas only The majority of the people are below the poverty line Another marked feature of these areas is that most of them fall in strategic zones where development of infrastructure, particularly, a good network of roads is necessary from the over-all point of view of national security

Present Indicators

Meghalaya is practically a hill state with a population of 10 12 lakhs (according to the 1971 census) Eightyfive per cent of the people live in rural areas The density of population per sq km in the state was 45 in 1971 having risen from 33 in 1961 The ratio of urban population rose from 2 83 per cent in 1901 to 15 27 per cent in 1961 but dropped to 14 55 in 1971

In 1971, work force participation rate was the highest in Arunachal Pradesh (57 65 per cent) followed by Nagaland (50 75 per cent) with Meghalaya occupying the third place (44 17 per cent) It compares favourably with the all-India level of 32.91 per cent, nearly 79 per cent of the workforce in Meghalaya were cultivators or agricultural labourers. Compared to the all-India level of 69 6 per cent The share of other occupations in percentage terms in Meghalaya was livestock, forestry (2 76 per cent), mining and quarrying (0 15), manufacturing-household and other than household (2 46), construction (0.89), trade and commerce (2.91), transport, storage and communication (1 34), and other services (10.52).

The participation rate among men in Meghalaya in 1971 worked out to 53 21 per cent and among women was 34 57 per cent. More of women workers (88.82 per cent) were engaged in agriculture than men (43 0 per cent)

During the decade 1961-71, no significant difference in regard to the distribution of the work force over various activities was noticed The large increase in the number of agricultural labourers in 1971, as compared to 1961, was on account of conceptual differences

The estimates of the state domestic product and per capita income for Meghalaya are still under preparation However, on the basis of whatever information is available, it can be inferred that, in 1973-74, Meghalaya had probably the lowest per capita income (Rs 596 at current prices) in the country. The all-India figure in the same year was Rs. 851 80

Backward State of Agriculture

Of a total geographical area of 22 5 lakh hectares in Meghalaya, only two lakh hectares are available for cultivation—a mere 8.8 per cent of the geographical area Practically, nothing is known regarding its distribution between various uses or about productivity of agriculture Only 26 per cent of the cultivated area is under irrigation Holdings are small in size and techniques of cultivation absolutely backward, resulting in low farm incomes

Between 1972-73 and 1975-76, the gross cropped area in Meghalaya increased by about 10 per cent There was an increase in area under high-yielding varieties during 1973-74 to 1975-76, under all the three crops—paddy, wheat and maize Similarly, the area under soil conservation also increased between 1973-74 and 1975-76 by about 37 per cent Consumption of fertilisers, however, declined. Consumption of pesticides went up by about 50 per cent. There were encouraging trends in the matter of distribution of tractors as well as power tillers. The foodgrains production went up from 1.25 lakh tonnes to 1.35 lakh showing a growth rate of four percent. In the fifth plan, the highest priority has been assigned to agriculture and allied programmes The outlay on these programmes is Rs. 16 94 crore which is 20 1 per cent of the state's outlay. This includes Rs. two crore for minor irrigation

Low Industrial Development

The economy of Meghalaya is primarily agrarian but the state is endowed with abundant and rich natural resources in the form of mineral wealth, forests and horticultural crops. Limestone deposits of both cement and chemical grade are estimated at 3,000 million tonnes, coal deposits at 550 m tonnes, sillimanite of the best quality (the largest single deposit known in the world) at about two million tonnes in the Khasi Hills district, and clay suitable for the manufacture of high grade glass at 100 million tonnes. Besides, a very large area of about 8.5 lakh hectares of forests exists

When Meghalaya was formed in April, 1970, there were only a small cement plant at Cherrapunjee, a bone meal unit at Burnihat, two tiny fruit processing units and some insignificant small industrial units including traditional small and cottage industries

In 1971, the Meghalaya Industrial Development Corporation (MIDC) recommended 50 industrial projects, both need-based and resource-based. These ideas have been further enlarged by identification of other areas by the Regional Research Laboratory, Jorhat and a study team of the Union government

Small industries with their high capital-output ratio, relatively unsophisticated technology and short gestation periods have a major place in the priorities for development Special efforts are being made to foster the growth of small-scale units in the State. The state government has created industrial estimates at two places and an industrial area in another MIDC and the Directorate of Industries also arrange procurement and distribution of scarce raw materials to small scale units which do not have funds to lock up in

large amount of raw materials inventory at a time. At the end of 1976, the number of registered factories stood at 49. The maximum employment in these factories was 3,058 in 1976

A large portion of the state is still to be covered by geological surveys. Even some of the known mineral deposits which have been surveyed in a preliminary manner in the past, will rejuire further detailed investigation for the purpose of assessing the reserves, quality and suitability for mineral-based industry The geographical location of the state vis-a-vis the rest of the country, and the concentration of minerals in the interior close to international borders and away from the state's links with the rest of India, are likely to make any mineral-based industry in the state unviable, if measured by all-India standards. If the state is to claim any position in the industrial map of the country at all, a judgement-oriented policy will have to be adopted and special incentives given to prospective entrepreneurs to attract them to the remote corners where minerals are in abundance.

Poor Communications

Before India became free, Shillong, the capital of Assam, was connected with Gauhati on the northern side by a pony cart road which was subsequently developed in stages into a motorable road and with Sylhet on the southern side. There was a road from Cherrapunjee to Shillong. Tura and Jowai were not connected by motorable roads

With the partition of country, areas on the southern side of the state lost their traditional markets and this had a crippling effect on the economies of these areas. Further, owing to partition, the districts of Cachar and Tripura were cut off from the rest of the country. Consequently, the Assam government made a beginning by constructing roads, linking those border areas as well as Shillong with the districts of Cachar and Tripura via Jowai. With the limited resources available, the then government could not make much headway in providing roads to the interior and rural areas of the state.

In Meghalaya, in the absence of rail and waterways, roads are the only means of communication. The road sector, deserves special consideration in this hilly state, where road communication is a pre-condition for development of agriculture, industry and other sectors.

As per country's 20-year Road Programme, 1958, drawn up for the country, the districts of Garo Hills, Khasi Hills and Jaintia Hills, then parts of Assam, were found to require 6,289 kms. of all-weather motorable roads by the end of 1981. At the beginning of the fifth plan, Meghalaya had a road length of 3091 kms which was expected to rise to 3,315 kms. by the end of 1976. Thus, the balance of 2,974 kms remains to be completed by 1981 With this road perspective, the fifth plan was originally prepared with a proposed outlay of Rs. 43 crore aiming at construction of 3,000 kms of new roads and black-topping of 658 kms of existing roads. The Planning Commission has approved an outlay of Rs 24 40 crore which includes Rs 1.82 crore under the minimum needs programme

The prohibitive cost involved in the electrification of rural areas in hilly terrains, makes most of the electrification schemes look *ab-initio* uneconomic. But the criterion cannot be cash returns or cash flows but the social, cultural and economic benefits which are likely to accrue to the nation, in general, and the concerned areas in particular

Allocation for power development in Meghalaya in the fifth plan is Rs four crore which includes Rs three crore under the minimum needs programme for electrification of 1,000 villages. All the growth points are expected to be covered with sub-transmission net work

Forest lands are far away from the transportation arteries. Inaccessibility comes in the way of exploitation of many of the potentially available resources They may have to wait till the forests are linked with motorable roads

The shifting cultivation or 'jhuming' in the state is highly wasteful involving "slash and burn" of the vegetation at random Generally, after two seasons, the cultivation is abandoned and fresh plot is selected No precautions are taken and the fire in the 'jhum' plot frequently spreads to the standing vegetation as well When the 'jhum' plot is abandoned, it is devoid of any cover The heavy rains cause havoc on these exposed soils robbing them of their fertility Due to population pressure, the 'jhum' cycle has now been reduced to three or four years as against the required minimum of eight to ten years As the cycle gets shorter, the plot has no time to recoup its original fertility and, therefore, more area is needed for 'jhum' in order to get a given yield to sustain a 'jhum' family. Keeping all this in view, the plan has allocated Rs. four crore for soil conservation including control of shifting agriculture

Though it has been acknowledged that horticultural development and the growing of cash crops offer the most preferable line of action for agricultural devolopment in the hill areas, nothing much can be done until communications are developed

Fruit-based Industry

The development of agro-based industries has also lagged behind in Meghalaya In spite of considerable production of pineapple, oranges and other fruits, no fruit-processing industry worth the name has grown in the state barring a few small units Low technology industrial units may be set up in the interior areas so that the difficulties of transport and communications may be overcome. The small units could be gradually enlarged Another view is that, despite difficulties in communications, there is sufficient scope for large-scale and medium-scale food processing units in the state

Hill areas, in general, are also rich in stream waters. Since these are usually fast-flowing waters, they are not of much use for irrigation, but they have tremendous hydro-electric potentialities. However, in the hill areas generation is one thing, transmission quite another and unless the latter is tackled properly, there is hardly any gain in generation merely

Meghalaya is endowed by nature for taking up fisheries on an extensive scale Fish culture could be, thus, an important possibility for future development.

The devlopment of small-scale industries and handicrafts is important in the hill areas from the point of view of spreading the benefits of industries to those living below the poverty line However, some important impediments in the devlopment of this sector are the lack of proper marketing arrangements and absence of the latest appropriate technology

The future strategy should give priority to opening the interior with an efficient system of roads, intensification of agriculture, a shift to cash crops, fruit cultivation, and development of infrastructure. ☐

?onsolidation, Not ?xpansion

DR. M. M. BHALERAO
&
M. K. VERMA

THE LAND Development Banks (LDBs) have complet-d more than five decades of his-ory in India. However, they did iot make much progress before the dvent of independence. A quarter entury of planning has witnessed onsiderable progress of LDBs.

It can be seen from table (next age) that LDBs have significantly nobilised resources (debentures) nd given loans to individual farmers rom the third plan onwards.

The all India rural credit review ommittee estimated the require-nents during the fourth plan for nvestment credit of a long-term iature to be of the order of Rs. 1,500 crore. Out of this Rs. 725 rore was to be for minor irrigation, Rs. 25 crore for reclamation of vaste land, Rs. 150 crore for soil conservation, Rs. 300 crore for ieavy machinery and implements, Rs. 75 crore for orchards and plant-itions, Rs. 125 crore for area pro-grammes and Rs. 100 crore for ural electrification. The target for oans to be issued during the fourth plan was fixed at Rs. 900 crore, out of which Rs. 700 crore was to be under the normal lending pro-gramme and Rs. 200 crore under special development schemes financ-ed with assistance from the agri-cultural refinance corporation. The oans issued to individual cultivat-ors during the fourth plan were esti-nated at Rs. 775 crore.

The quantum of finance expected o be made available for agricultural levelopment through short, medium und long-term wings of the coope-ative credit structure during the ifth plan is detailed in table (next page).

The investment credit to be pro-vided by LDBs in various states during the fifth plan is shown in acing table. The states have been livided into three categories on the basis of per hectare outstanding oan amounts of central LDBs as on 30th June, 1971. States where he outstandings are more than Rs. 60 per hectare are on the A category, those where the out-standings work out to between Rs. 30 and 60 per hectare in the B category and those having less than Rs. 30 per hectare in the C cate-gory.

In the sixth plan, the quantum of finance to be provided by LDBs will have to be more than one and a hilf times in the fifth plan, be-cause of the increased cost of mate-rials and machinery required for building up long-term assets on the farm.

The Madhava Das Committee (1973) as well as the Hazari Com-mittee (1975) recommended the in-tegration of short, medium and long term credit. The local conditions in different regions and the level of growth of LDBs in different regions have to be kept in view. Efforts will also have to be made for greater coordination between LDBs and commercial banks. The procedures will have to be further simplified.

TARGETS FOR LONG-TERM LOANS TO BE PROVIDED UNDER THE FIFTH PLAN

(1974—79)

LOANING OPERATIONS OF LAND DEVELOPMENT BANKS DURING PLAN PERIOD

(Rs. Crores)

S. No.	Particulars	Target for loans to be issued	Debentures Issued				Loans issued to individuals
			Ordinary	Special	Rural	Total	
1	First Five Year Plan (1951-2 to 1955-6)	.	8		.	8	11
2	Second Five Year Plan (1956-7 to 1960-61)	25	22		3	25	37
3.	Third Five Year Plan (1961-2 to 1965-6)	150	127	9	10	146	166
4.	Annual Plans (1966-7 to 1968-9)	275	223	27	8	258	300
5.	Fourth Five Year Plan (1969-70 to 1973-74)	900	549	273	6	828	775

COOPERATIVE CREDIT IN THE FIFTH PLAN

(Rs. Crores)

S No	Type of Loan	Fifth Plan Programme	1974-75		1975-76
			Target	Likely achievements	Target
1.	Short-term	1319 00	807 00	820 75	979 20
2	Medium-term	330 00	58 00	55 34	74 94
3.	Long-term	1500 00*	248 73	226 97	256 45

*Includes not less than Rs. 600 crore under special schemes of A.R.D.C.

More strict supervision will have to be enforced to avoid misuse of LDB loans Viability and efficiency of LDBs will have to be taken care of to ensure fuller use of ARDC loans routed through LDBs which will have to be made self-reliant with greater stress on mobilisation of resources through rural debentures. Staff training will have to be more effective and the distribution of work load will have to be rationalised and their pay scales and allowances will have to be revised with emphasis on incentives for efficient workers and punishment to the defaulters The sixth plan should concentrate on consolidation and strengthening of the LDB structure rather than on expansion.

MEDICINAL HERBS OF PITHORAGARH

RAMESH CHANDRA PANDE

THE northern part of Pithoragarh district in the Himalayan region of U.P. is a natural abode of a large number of medicinal plants which grow wildly in its dense forests This area with elevations ranging from 1,800 to 5,400 metres comprises the Munsyari and Dharchula sub-divisions, extending deep into the greater Himalayas The highest peaks of the Panchchuli group of mountains having altitudes ranging from 5,600 to 6,904 metres are located in this region. Owing to the humid and extremely cold climate, the vegetation of this region differs from those of the rest of the district. Snow-clad peaks, glaciers and a long stretch of barren land characterise the topography of this region

A number of rare species of medicinal herbs are found particularly at elevations of over 2,500 metres. Huge quantities of medicinal herbs are exported from these areas.

These rare herbs of medicinal value of the region constitute a rich resource in current pharmaceutical uses and are of great commercial value The establishment of a herb processing factory here would improve the economy of the area. Cultivation of medicinal plants in suitable localities can be taken up. In due course, these can develop into established farms. All this will provide greater employment opportunities to the local inhabitants.

A Case of Successful Marketing in Rajasthan

R. K. DIXIT

THE RAJASTHAN State Agro-Industries Corporation was set-up in August, 1969, to accelerate the pace of mechanised farming and make available to farmers agricultural machinery and other inputs on a large scale. The Corporation had to face a lot of competition from entrepreneurs already well established for a number of years.

In the context of a shift from "sellers to buyers" market the customers had become selective in their choice of material, looked for better service and were in a position to dictate their terms. The management of the corporation accordingly decided on quality control to give maximum satisfaction to its customers, through a specially created department. This department is engaged in the preparation of drawing and designs, making standards and issuing necessary instructions to the production department.

A scheme of agro-service centres, financed by Central government with State government participation makes tractors available for custom hiring, undertakes the repairs of tractors and makes available spare parts and fertilisers at fixed rates

The Corporation had trained 315 agro-service entrepreneurs up to March, 1975, out of which 253 have established their agro-service centres in different parts of the state.

Advertising in leading agricultural journals and newspapers, which normally circulate in the rural areas and posters and handbills have popularised the services offered by the corporation. The corporation, through these measures and through cost control research and development has been able to push up the sales from Rs. 12.56 lakh in 1970-71 to Rs 48 78 in 1974-75

Good marketing policy is a sensitive and effective tool in the hands of management. Marketing policy has proved useful to management in future planning and review of past performances.

The three great American vices seem to be efficiency, punctuality and the desire for achievements and success They are the things that make the Americans so unhappy and so nervous.

—LIN YU TANG

Twilight Areas

DR. K K. SINHA

THE AUTHORS of people's plan II call the new strategy a break on 'imbalance which has been responsible for continued stagnation alongwith inflation in the Indian economy'. To put it more clearly, the average rate of growth has been three per cent so far, of which 2.5 per cent is offset by population growth. The imbalance has caused rich sectors to grow fast leaving the poor sector poorer. Since the formulation of the second plan, doubts were being raised in respect of the path of 'unbalanced growth' chosen by the planners. According to Herchman Heavy industrial investment (as initiated in 1956 in India) caused 'dynamic tension' in one sector and the rest of the sectors chased it. But such crab-like movement has not occurred because the institutional base for such growth did not exist. As such the spread effect remained limited to urban pockets and a backwash effect prevailed in the rural economy.

The people's plan strategy is a choice rightly for more balance between rural and urban sectors, between agriculture and industry, capital and consumption goods, large and small industry and between income and employment. A shift in priority in the new plan from income and growth to consumption and distribution is, therefore, necessary. The balance according to the people's plan would be achieved if the necessary input and infrastructure is provided by the urban heavy industry sector while new incomes and employments are generated in the agricultural and rural industry sectors

It may be added here that the Indian plans have been unbalanced on the financial front also, and deficit budgeting has remained the rule. But this Keynesian technique of generating money incomes has only resulted in wage and profit inflation without increasing real resources. It has not generated sufficient impulses in the non-monetised rural sector except increasing pressure of demand by the organised sector for food. It has also created a wage gap between rural and urban workers stunting the growth of industries in villages. How strange is the fact that labour becomes so costly in a labour surplus economy ! A financial balance as visualised by the people's plan may go a long way in securing income distribution in real and equitable terms. The people's plan is, therefore, an experiment which must be given a fair trial especially when 25 years of planning has failed to eliminate the poverty of about 13 crore people in the village sector.

Perspective and Constraints

The 'balanced growth' strategy as visualised by the people's plan is a perspective of 20 years with ten years as an indicative phase (1978—88). The first ten years thus may indicate a fresh 'take-off' when a proper institutional base in rural India is created for receiving the stimuli of overall growth. The major doubts about the success of this plan do not, therefore, rest on the strategy chosen but on the way this is going to be implemented.

The major constraints inhibiting the Indian plans have been population growth, fiscal rigidity, stunting of rural institutions, unhealthy competition between public and private sector industries and existence of rural power blocks acting against land reforms. The people's plan is conscious of these factors but it does not explain precisely how will it deal with this.

In fact this plan also seems to depend upon centralised targets in the absence of rural panchayats which could have worked as development agencies The C.D. projects have exhausted themselves while the three-tier rural system of government has yet to take effective shape. In the absence of these rural agencies a rural-oriented plan for decentralised development will be more handicapped than centralised plans. Model panchayats on some optimum pattern have to be immediately set up.

Further the people's plan does not have an area plan which again is crucial for area development. How will the rural growth centres be created and what distances would form them. These questions require spatial hypotheses. A rural industrialisation scheme has to start with a list of viable industries arranged in order of their scale and distance from the lowest centres. This requires a detailed rural survey in respect of inter-village linkages and market locations. A market hierarchy has to be created in villages so that village activities could be fairly dispersed on optimum market norms. This involves restructuring of villages with different sizes of markets in between them.

The people's plan makes a reference to 'rational reforms' in respect of land distribution and land cultivation, but this has to be more specifically defined. A rural plan must make a start on a rational hypotheses regarding maximum and minimum land holding. For example let the plan work out the implications of land distribution with 30 acres at the maximum and three acres at the minimum ends. These may give out the optimum and basic sizes of holdings and a population spill over for rehabilitation in village industries at different wage rates.

The people's plan is also not very clear as to how it will avoid budget deficits. The success at the fiscal front would depend mainly on the pattern of taxation chosen. The major shift must take place to farm taxation which is obsolete and ineffective now. It is sterile more particularly for local governments which may have to bear the burden of ruralised development as proposed in the plan. The indirect taxes also have to be re-structured in a regional development scheme where inter-area flows of resources may have to be planned and taxes like sales taxes or multiple rate excises may hinder development.

Further, the sphere of the organised sector and the relation between private and public sectors have also to be reoriented according to the needs of a rural plan. A rural plan would require a thorough diversion of resources from its present use so that it flows to the rural sector or to such production as would provide the necessary infrastructure to rural production schemes. This may require private and public investments to be diverted to small industries in rural areas.

The fear in such diversion is the likely slump in overall growth rate. The people's plan estimates that the rate would slightly increase from 6 to 6.4 per cent annually with an increasing incremental capital-output ratio (ICOR) from 3.2 to 3.8 in four quinquenniums. This

ICORs of selected industries

Industry	*ICOR**	*Cottage Industries*	*ICOR@*
Shellac	2.18 to 2.22	Blotting paper	2.16
Food & agro	1.47 to 2 8	Soap from non-edible oil	0 39
Saw mill and wood	0.42 to 1 65	Village ghani	0.45
Mica	1.3 to 2.03	Palm gur	0.15
Utensils & fabrication	0 9 to 2 30	Cottage match	0.23
Small tools	1 25 to 3.86	Village tanning	0.35
Stone clay	0 47 to 1.0		
Small scale chemicals	1.32 to 1.84		

Source :—*A survey of Chotanagpur small and medium Industries during 1967-68 by the author.

@Building from below, A.I. Khadi and Village Industry Board ed. M.P. Desai, 1957, p. 28.

may be compared to the fifth plan growth rate of 5.6 per cent and an ICOR of 3.4. The assumptions about a slightly lower ICOR of the people's plan in the first five years are based on low capital requirements and short gestation period of the projects, non-inflationary expansion of goods and increase in social inputs which might substitute capital. The increase in the ICOR in the successive five year periods (more than the fifth plan figure) is, however, not explainable. If the increase is due to a shift towards more capital intensive technological options, how then is the people's plan strategy different ?

Does it mean that by the first five year period the rural unemployment problem would have been solved and labour substitution by capital would be possible. Further it is not clear why the ICOR should be so high even at the beginning when priorities have to change in favour of rural industries so much. It may be pointed here that the ICOR between the three plans is calculated at 2 4 and between 1961—68, at 3.7. A further reduction to two was visualised during the fourth plan. A list of ICORs of small and medium industries as well as of cottage industries is given to show that the people's plan estimates about the ICOR do not seem to be in tune with the strategy chosen by it.

It may be pointed out here that the ICOR of small industries tends to be lower than its average COR while ICOR in general tends to decline with development due to change in the efficiency of capital and labour and various institutional changes implicit in planning. This all suggests that the people's plan may require a revision of the design to make it more labour intensive.

It may also suggest that the changes in the priorities (which the people's plan visualises) vis-a-vis those in the fifth plan may also need a revision. The following table compares the priorities of the two plans :

	Fifth Plan	People's Plan
1. Agriculture	11.8	15.3
2. Irrigation & flood control	8.9	13.3
3. Education	3.3	7.5
4. Social service	12.1	23.1
5. Power	18.6	10.3
6. Industry & Mining	26.0	15.2
7. Transport & Communication	17.5	14.2

For an 'input-infrastructural-institutional base which the people's plan proposes to build the social service priority may be slightly reduced in favour of power and transport which are so essential for rural industrialisation. The rest would do well with a slightly more rural-oriented design of capital structure of industries.

An American editor worries his hair grey to see that no typographical mistakes appear on the pages of his magazine. The Chinese editor is wiser than that. He wants to leave his readers the supreme satisfaction of discovering a few typographical mistakes for themselves.

Solar Cookers for Rural Kitchens

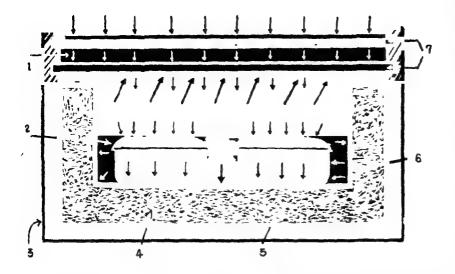
RAMAN PATEL

SOLAR ENERGY has passed the stage of experimentation in laboratories and is now being harnessed for heating of buildings in some countries. Experiments have also been made to use this form of energy for generating electric power to run water pumps. In France, successful experiments have been made to melt iron and steel by the use of solar energy. Long ago, Israel and Japan developed solar heaters to heat water and the same are being used on a large scale, in both these countries. However, we have still not reached a stage where solar energy can be utilised on commercial basis.

India, though a tropical country, endowed with clear sky and a bright sun for about 9 months in a year, has not made much headway in this direction. In view of this, whatever pioneering efforts are made at the successful use of solar energy deserve encouragement and support. One such effort, has been made by the "Yantra Vidyalaya" of Bardoli. The Vidyalaya, though normally engaged in the development of improved agricultural tools and implements, has successfully developed a solar cooker which is simple enough to operate, even by the illiterate rural people.

The device is so simple, that it can be manufactured and repaired locally with locally available materials. The cooker consists of a tin case, something like a flat, steel trunk with a glass cover. Inside the tin case, there is a small box made of tin. There is some space between the small inner box and the outer tin-case. This is stuffed with non-conducting material like rice-husk and wood-dust, which is easily available in the rural areas.

SIMPLE DEVICE

The case-cover contains two glasses with space between them and are fixed in air tight positions The layer of air formed between the two sheets of glass acts as a non-conductor. The inside of the box is painted with a special black


colour called the "interior boiler black". An elastic rubber tubing is provided on all the four inner sides of the cover to make the inside of the box air-tight The cooker contains four tightly covered metal boxes, to keep the food to be cooked These metal boxes are coloured black from outside, to ensure maximum absorption of heat It is calculated that 95 per cent of the heat of the Sun rays is absorbed by black colour

The working of the device is simple too. The Sun rays after falling on the glass cover, pass through the glass sheets The heat-rays inside the case are prevented from escaping by the non-conducting layer of air formed between the two sheets of glasses, and also by the non-conducting material, rice husk or wood-dust stuffed between the two cases The heat generated inside the case is passed on to metal boxes which contain the food to be cooked This gradual accumulation of heat, is sufficient to cook rice, dal, vegetables, upma, sweet rice, bread, kheer and some other items All that the house wife has to do is to keep these items mixed with spices in the closed boxes with appropriate quantity of water and put them in the solar cooker Once this is done, there is no need to look after it occasionally It will not boil or over-flow nor get charred, because the process of heating is very slow. The food will be cooked and ready for consumption in about three hours.

The only condition for the working of this cooker is that there must be a clear sky with a bright sun. Another limitation of the cooker is that it takes about three to three and a half hours to cook the food However, this limitation has its own uses for the rural folk Knowing that it takes three hours to cook the food they can go for work in the fields or elsewhere with an easy mind

Easy Maintenance

The cooker can be kept in any space open to sky and can be manufactured by local carpenter Once manufactured, it does not require frequent repairs and the repairs if, at all, are also of a very minor nature The present cost of the cooker is about Rs. 300 The Vidyalaya is now working to bring down this cost too. However, according to the calculations made by the Vidyalaya, even the present cost is fully recovered, over a period of two years, by way of saving of the cost of fuel As the cooker does not require any fuel, there is no air pollution, which is normally caused when wood and cow-dung are burnt as fuel in the villages Indirectly the cooker also helps in preventing occurrence of eye diseases such as trachoma, caused by smoke particularly among the rural women □

It seems to me that the worst comment on dictatorships is that presidents of democracies can laugh while dictators always look so serious with a protruding jaw, a determined chin and a pouched lower lip, as if they were doing something terribly important and the world could not be saved except by them

Export Trends During the Plans

—Jawahar Lal

FOREIGN TRADE is a barometer of the growth of a country's economy especially of a developing country like India.

Our exports in 1976-77 stood at 4980 60 crore as compared to Rs. 459 crore in 1948-49, a ten time increase These are considerably diversified ranging from traditional items like jute, tea, coffee, cotton textiles, mica and manganese to non-traditional commodities like machine tools, locomotives, textile machinery, sugar mill machinery, trucks, transmission towers, drugs, pharmaceuticals and various other sophisticated engineering goods.

Surplus Trade Balance

Export promotion as an integral part of economic development started gaining momentum during the Third Plan period. In 1960-61, the exports amounted to Rs. 660 crore while the imports totalled Rs 1,140 crore In 1965-66, the exports rose to Rs 805 crore while imports stood at Rs. 1,409 crore The growing imbalance, however, was due mainly to higher imports for developmental needs.

This situation invited renewed efforts to further improve exports. And happily the trade balance showed a surplus of Rs. 104 and Rs 72 4 crore in 1972-73 and 1976-77 respectively. The following table shows our export performance during each plan period :

TABLE

Exports	(In crore of rupees)
Ist five year plan	3,029
IInd five year plan	3,047
IIIrd five year plan	3,809
Three annual plans	3,645
Fourth five year plan	9,050.88
Fifth five year plan -	
1974-75	3,328.83
1975-76	4,042 81
1976-77	4,980.60

SMALL SCALE UNITS

Employment Potential and Capacity Utilisation

K. K. RUDRA

SMALL industries have a number of plus points from the point of view of location, capital and import needs, employment and income distribution. They are particularly suitable for employment of women, fuller employment of the underemployed and seasonally unemployed, and self-employment of the educated unemployed. In the special employment programmes of the fourth plan, a good deal of emphasis was placed on the promotion of small scale industrial ventures by the educated unemployed

The final version of fifth plan has also noted that appropriate use of fiscal credit and production support policies in this sector is essential for reinforcing its capabilities for further generation of employment. Of the total Fifth Five Year Plan outlay of Rs. 39287.49 crore, Rs 535 crore was earmarked for village and small scale industries (Rs. 178.60 crore for small scale industries alone.

THE 1974 CENSUS

A census of small scale industrial units was conducted in 1974 by the Small Scale Industries Development Commissioner, Ministry of Industry, with the reference year 1972. The report of this census was brought out in January 1977.

The census found that the registers of the Directors of Industries bore the names of 2.58 lakh small scale industrial units out of which only 62 per cent were found to be working. Census data were tabulated for 1.4 lakh, of which 35 per cent came into existence in the first four years of the fourth plan, 61 per cent of units were proprietory units and about 6,000 were reported to be ancillary units. About 70 per cent of the units were using electricity.

Another finding was that with an investment of Rs. 10.55 crore in fixed assets the units provided employment to 16.55 lakh persons. This

TABLE—1

Production and Employment in 1972 in Small Scale Units and Estimated Employment at 80 per cent capacity utilisation

S. No.		*Production in 1972 (in Rupees)*	*Employment in 1972 (in number)*	*Estimated employment at 80 per cent capacity utilisation (in number)*
1	2	3	4	5

Source : Report on the Census of Small Scale Industrial Units, 1977, Ministry of Industry, Government of India.

works out to 13 people employed for every one lakh rupees of such investment. The gross value of output was Rs. 2,603 crore, of which 150.49 crore was accounted for by export, mostly food products, leather and leather products.

The units were grouped into 490 industries, 29 of whom had more than 1000 units each No district in the country had more than 5 per cent of units. Maharashtra, Punjab, Tamil Nadu and Uttar Pradesh had more than 10,000 units each and together accounted for 52 per cent of the number of units and 59 per cent of the output. On an average, at the all India level there were 12 persons working in a unit. About 70 per cent of the units employed less than 10 workers each and 26 per cent between 10 and 49 workers each It is learnt that about 90 per cent of these units really belong to the non-factory sector.

The value added by the small scale units covered by the census was Rs. 841 crore or 32 per cent of the gross value of output. The ratio of self-employed to wage employed is 1 . 7. The wage per worker employed comes to Rs 1400 per annum, while the value added per worker is estimated at Rs. 6,204.

Of the total number of employees, 44 per cent were skilled', 38 per cent were unskilled, and 12 per cent were managerial and supervisory staff. Skilled workers formed 62 per cent of the total employment in cashew-nut roasting and frying, 60 per cent in woollen knitted wares and leather shoes. They were in lowest percentage (33 per cent) in metal industries.

The most notable finding of the survey is that except for vegetable tanning and light leather nowhere was the capacity utilisation higher than 80 per cent and in the case of candles it is as low as 35 per cent. On an average, capacity utilisation was 53 per cent.

Employment in the industrial sector can be increased by increasing the number of production units or by increasing capacity utilisation. The second method is more economical. Excess capacity may have been due to shortage of demand, raw material and power, transport bottleneck or industrial unrest. That is why the Committee on Unemployment in its interim report on short term measures for employment listed the maximum utilisation of installed capacity in industry as an important measure.

Taking a practical overall view and projecting a 20 per cent increase in capacity utilisation, subject to an 80 per cent mean limit of such utilisation, the 1974 census of small units estimates the additional requirements of the units covered by the census at Rs. 261.27 crore for raw material and components The additional requirements of industrial components were put at Rs. 32 5 crore of indigenous equipment and Rs. 4 6 crore of imported origin. With modest additional investment for a 20 per cent increase in capacity use, some 22 77 lakh additional jobs can be created Demand for the products will go with the growth of working population and development of industry and agriculture.

The 1974 census covered only 1 4 lakh units and could not cover nearly 21,000 units which started working between 1972 and 1974 This works to about 10,500 units started every year In fact, the average is nearer 11,500 units a year taking the six year period up to 1974, into account Assuming a constant average of 12 men employed by a unit (on the basis of the 1974 census finding), one may project additional employment of 1 36 lakh people a year at the average rate of new units on the basis of what was noticed between 1968 and 1974 One has to keep in view, however, that the figure is probably a little higher because not all units are registered and accounted for and 22 categories of small industry like handlooms are outside the scope of the small industries development organisation

Skills in these units are mostly acquired while on the job

It is clear that there exist quite impressive prospects for the generation of additional employment in the small scale industries. A quick review of the up-to-date capacity utilisation of small scale units and factors for low utilisation should be made Particular attention may be paid to industries employing more people per one lakh rupees of investment in fixed assets. Fiscal, technical, financial and raw material support should be given to them. Marketing guidance and entrepreneurial training assistance are equally necessary. □

THE BEAS SUTLEJ LINK PROJECT

A Marvel Of Engineering

O P. Datia

THE NORTHERN region has an estimated exploitable potential of 10.73 million KW of power Of this, only 2 19 million KW could be exploited by the end of 4th plan and another 4.42 million KW by the end of the fifth plan The Rs 383 crore Beas-Sutlej Link Project which is one of the largest consortium of tunnelling ven-

Sundernagar Channel

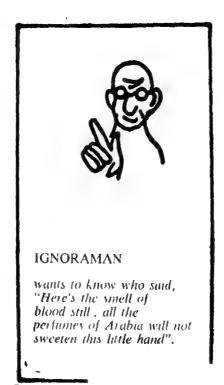
Pandoh Dam and Spillway

tures of complex hydraulic structures in South East Asia envisages diversion of surplus waters of river Beas into river Sutlej, for irrigation and power generation. The Pong Dam as the second limb, which would irrigate 1 60 million hectares of land in Punjab and Rajasthan, is already complete.

A 72.25 m high earth-cum-rock-fill dam across the river Beas at Pandoh, diverts 4716 million cu.m. of waters into 13 11 Km long and 7.62 m dia Pandoh Baggi Tunnel, which merges into Sundernagar Hydel Channel at Baggi. This Channel 11.81 Km long, takes the water further into 8 53 m dia--12.35 Km long Sundernagar Sutlej Tunnel, through a Balancing Reservoir. It terminates into the Surge Shaft and Penstocks of the Dehar Power Plant complex, which is located at Slapper. The diversion system makes use of a 320 m fall available at Dehar on the right bank of the river Sutlej, for generation of power, in addition to augmenting the same at Bhakra through Gobind Sagar reservoir

The Power Plant at Dehar will have an ultimate installed capacity of 990 MW. It will house 4 units each of 165 MW in the first stage and two more units each of similar capacity in the second stage. These are the largest hydro-electric units in the country so far. The six turbines spinning under the kinetic energy of 320 m column of water would provide 267 MW of firm power. Additional firm power through Bhakra Power Plants would be about 148 MW

Power and Irrigation Potential

Of the total power generated Punjab will get 48 per cent, Haryana 32 per cent and Rajasthan 20 per cent


Out of 4716 million cu m of water diverted from river Beas to the river Sutlej in a mean year, 2010 million cu m would be released back to the river Beas for utilisation in Harike Canals. Thus, additional supply of 2706 million cu m would provide assured supplies for perennial irrigation to about half a million hectares of land in Punjab, Haryana and Rajasthan

Socio Economic Benefits

The project has yielded multifarious socio-economic benefits for the people of contiguous areas. Modern townships like Sundernagar, Pandoh and Slapper are now brightly lit up with electricity. Pucca houses have given place to thatched huts, means of communications to the interiors have improved, the valleys will have pisciculture, afforestation and tourist boom and fruit orchards have immediate access to the mandi towns.

The completion of the project will also help to eliminate regional imbalances, mitigate unemployment and poverty and minimise the devastating effects of floods and droughts.

EXPORT TRENDS

(*Contd from page* 31)

and Industry in early 50s to study marketing conditions abroad, enforcement of quality standards for exports, speed investigation and settlement of complaints, organisation of publicity and the like. There are now 17 Export Promotion Councils apart from the Marine Products Export Development Authority. Also set up are four Commodity Boards under the Ministry dealing with the export of tea, coffee, rubber and cardamom. The Federation of Indian Export Organisation stands at the apex to coordinate and supplement the promotional activities of the Export Promotion Councils and Commodity Boards

Quality plays a vital role in enhancing the competitive worthiness of export goods. A statutory body named Export Inspection Council, set up in 1963 carried out pre-shipment inspection of goods which now account for 90 per cent of the export trade. The preshipment inspection of textiles, yarn and textile machinery is the responsibility of the Textile Committee. An organisation known as the Trade Development Authority has been set up to provide a package of specialised services in the field of production of export-oriented goods and their marketing

Yojana Quiz

1. No. of Doordarshan stations in India is ·
   - (a) 7
   - (b) 9
   - (c) 13

2. No. of Television receiving sets as on 31-12-76 was
   - (a) 1,00,000
   - (b) 50,080
   - (c) 1,20,030
   - (d) 4,79,026

3 Where are the following deserts situated
   - (a) Rub'al Khali
   - (b) Takla Makan
   - (c) Kara Kum.

4 Where are the only volcanoes in Indian territories ?

5. What is the largest inland sea ?

6. Howrah bridge on the river Hooghly is the third cantilever bridge in the world Which is the longest cantilever bridge in the world ?

7 How many days the planet Pluto takes to give one revolution around Sun ?

8 The Second National Flag was hoisted by whom, where and in which year ?

9 Where is Ittiadoh project ?

ANSWERS :

1. (c) 13

2. (d) 4,79,026

3. (a) Part of Arabian desert.
   (b) South Sinkiang, China
   (c) South-west Turkistan, USSR.

4. One is the Barren Islands about 140 Km north-east of Port Blair, and the other is the Narcondam Island, about 150 Km north-east of the Barren Islands.

5 Kaspiskoye More (Caspian Sea) USSR-Iran, 760 miles long and total area 143,550 sq miles

6. Quebec (over St. Lawrence River, Canada) 3,239 ft in overall length

7. 90,400 days.

8 The Second Flag was hoisted by Madam Camma and her band of exiled Indian revolutionaries in Paris in 1907

9. On the Garhvi river, a tributary of the Vainganga, in the Vidarbha region of Maharashtra which is meant to irrigate 450,000 acres.

Adventure does not mean that you have to risk life every inch of the way.

—Edmund Hillary

BOOKS

How to Plan the Future

The Indian Dimension—Politics of Continental Development *by Romesh Thapar, Vikas Publishing House Pvt. Ltd., Pages 192, Price Rs. 40.*

THE book is an outgrowth of Romesh Thapar's lectures and writings, covering a broad spectrum of subjects, ranging from Gandhi's concept of non-violence to "Contradictions in co-existence". As such, it bears a stamp of originality, intellectual freshness and individuality which should stimulate intelligent discussion. According to the author the seventies will be dominated by the debate around the central issue of how to plan the future He feels that no party can afford to neglect it. No party can any longer run for remedies to economic models which have little relevance to Indian continental realities He wants the mass line to become the motivator of policies and perspectives An experimental application of this approach to a narrow area of development immediately throws up a new frame of operation He asserts · "No longer can we rest content with injecting radicalism into the content of planning without drastically altering the frame of planning" This, according to him, has been our grave error He points out that our democracy is shaping differently from the models in the West with which we have been familiar The author desires our economic system to find its roots in our soil and throw up concepts which make sense in our social setting What is the role of leadership in such a set up? He wants political and economic leadership to combine to attack the problem of poverty and despair

The author's optimism overflows when he says that the more perceptive are at last beginning to realise that only a major overhaul of the framework within which we have been functioning is on the agenda. With the delay in facing this challenge embedded in all notions of economics, politics of the meaning of change is intensifying the crisis which surrounds us. He further observes we need to clean our brains of the cobwebs which prevent us from seeing the qualitatively new elements which are shaping the future He sees a deep reluctance to adjust to the essence of this challenge. Reluctantly or otherwise, we would like our policy-makers to work out a mass line for the upliftment of our people He wants them to find the short cuts to real standards of living which are dignified and wastefree The challenge is wide-ranging, almost forbidding, but it cannot be met by easy slogans of the free enterprise and planned societies.

Talking in the same vein, he argues that social ownership of the means of production has to be steadily extended until the power of private wealth to subvert social and distributive justice is broken He warns that this does not mean total social control immediately. Control certainly of a kind which makes it impossible to subvert policies vital to social and distributive justice He wants wealth in the key sectors to be produced and distributed under social control.

His analytical powers find expression when he refers to egalitarism. He deplores the trend among our planners of glibly indulging in the talk of bridging the many gulfs between our people and of the need to be egalitarian in outlook and policy, but doing everything possible through planning processes, rules and regulations and value systems to increase the gulf. He concludes : "twentyfive years of freedom have not seen any improvement in their economic-social stratification". Indian democracy demands a growth model which ensures substantial changes in the basic living conditions of the mass of our people within their life-time. Is this author's pipe-dream?

The book is an eminently useful contribution to the understanding of modern Indian society. It is dominated by the author's preception, catholicity and vision

Subhash J. Rele

Readings in Professional Management

Professional Management in India—Problems and Prospects (Eds) M. V. Pylee and K. C. Sankaranarayanan; Published by Foundation for Management Education, (University of Cochin) 1976; Pages 466; Price Rs. 75.

THE volume under review consists of thirtynine papers, all published separately in Indian Manager, a quarterly journal on management of the Foundation for Managtment Education of the University of Cochin. The book seems to have been conceived and structured to provide answer to certain basic questions such as what is the extent of professional management at present in India, what are the problems it faces, what factors help or hinder the growth of professional management etc., raised in the minds of young students preparing to enter industry, practising managers and others including teachers interested in the discipline of management. But one, unfortunately, gets not only no clear glimpse of a well-articulated objective-oriented elaboration of the theme, but one even misses an integrated, logically disciplined analysis of the formulation sought to be presented through this volume. Perhaps, it is ingrained in the very nature of such a publication, which consists of a conglomeration of disjointed articles and which, *ipsofacto,* imposes severe constraints on editorial discretion about choice of contributors and subjects quite apart from other psychopersonal bias-blocks. These factors appear to have largely contributed to the inadequacy of this book.

The volume is divided into three parts. Part I deals with Management Development (15 papers), its evolution in India, prerequisites, methods and challenges. Part II deals with Public Sector Management (10 papers) and Part III deals with Personnel Management and Industrial Relations. (14 papers)

Some of the subjects included in this compilation are interesting and some of the authors are quite well known in the management field However, both these factors have not been able to bail this book out of the ordinariness and casualness, despite Editors' well-known interest in the development and promotion of what this reviewer would prefer to call, a 'baby discipline', that management still is in our country. Readers expect much more professional theme-handling and loftier things from K. T. Chandy, Iswar Dayal, J.R.D Tata, P K. Tandon, K S Basu.

BATA K. DEY

Development Notes

Bombay High Oil Production

The Bombay High oilfield has yielded five million barrels of crude oil accounting for a saving of about Rs 50 crore in foreign exchange in a year. Oil began flowing from Bombay High in May last year. The present production rate is about 40,000 barrels a day.

Development of the Bombay High and Bassein oilfield has been divided into three phases. Work on the first two phases has been completed. The ONGC has now taken up phase III, which is divided into parts The total investment on the first two phases is estimated at Rs. 149 89 crore.

PAU Releases New Varieties of Pulses

Two new varieties of pulses namely G 543 of gram and PG 3 of Peas have been released by the State Varietal Release Committee of the Punjab Agricultural University, Ludhiana. G 543 is a variety of *desi* gram and is specially suited to humid, sub-mountainous tract comprising districts of Gurdaspur, Roopnagar, Hoshiarpur and Amritsar.

This is resistant to gram blight, wilt and foot blight and has given an average yield of 14 quintals per hectare as against 11.6 quintals of C 235 on the basis of 16 trials at Research Station, Gurdaspur, representing an increase of 21 per cent

The new variety of field peas, PG 3 is dwarfer and the seeds are bold. After soaking in water the dishes prepared are sweeter and tastier than those prepared from T 163 This variety has given an average grain yield of 21 7 quintals per hectare as against 15.7 quintals per hectare of T 163 on the basis of 19 State level trials at experimental fields held from 1972-73 to 1976-77, an advantage of 38 per cent over T 163.

Central Aid for Export Production Project

The Centre sanctioned Rs 25 lakhs for Assam in 1976-77 for two special projects, one intensive development project to cover 10,000 looms and another export production project to cover 100 looms Of this amount, the first instalment of Rs 15 lakhs (Rs 11 25 lakhs as loan and Rs 3 75 lakhs as grant) had been released to the State government in 1976-77 The export production project is located at Sualkuch

Gujarat Ports Exchange Earnings up

The foreign exchange earnings of 40 minor and intermediate ports in Gujarat went up considerably to Rs. 191.41 crore from Rs. 127 26 crore in the previous year. This was owing to a spectacular rise in exports from these ports which rose by 17 per cent, and were far ahead of imports. The exports traffic rose by 3 18 lakh tonnes to reach an impressive figure of 22.01 lakh tonnes as against 18 33 lakh tonnes in 1975-76.

Land Banks to Simplify Loan Procedure

The banks annual advances which were just about Rs. 2.5 crore in 1951-52 when the first plan was launched, had exceeded the figure of Rs 220 crore in 1976-77 Total advances so far amount to Rs. 1850 crore Out of a lending programme of Rs 1500 crore envisaged for the fifth plan period the banks have already disbursed more than Rs 1000 crore During the current year, the banks would lend Rs 328 crore

Schemes for simplifying the loaning procedures and for disbursing loan amounts to farmers at their door-steps are expected to be implemented during the current year by Land Development Banks functioning in different parts of the country The loaning operations would be diversified to cover purposes subsidiary to agriculture for augmenting the income of the farmers and to create employment potential in rural areas.

Plan to Raise Coffee Production

A Rs 250-crore plan to raise coffee production two-and a half times by 2000 AD has been drawn up by the Coffee Board

Under the plan an additional area of 1 30 lakh hectares is to be brought under coffee cultivation by 1993-94 so that these areas reach the yielding stage by 2000 AD The production from these areas would be 1 15 lakh tonnes This would raise the total coffee production to 2 52 lakh tonnes from about one lakh tonnes at present

To begin with, an additional area of 40,000 hectares is proposed to be brought under coffee cultivation by 1984-85 with a capital outlay of Rs 75 crore The rest of the investment is to be phased out over the remaining period

Tractors Production to be Stepped up

The Bihar State Agro-Industries Corporation has planned to roll out 2,000 HMT Zetor tractors in 1977-78 The production is to be gradually stepped up to 10,000 in five years The corporation took up the assembly of tractors in collaboration with Hindustan Machine Tools in June 1976

Employment Guarantee Scheme

The Maharashtra Government will undertake to provide jobs to every able-bodied person in rural areas. If the government fails to find a job within 15 days of application, it will pay the applicant an unemployment allowance of Re. 1 per day Altogether Rs 25 crore will be required as unemployment allowance. These provisions are incorporated in a Bill on the Employment Guarantee Scheme introduced in the legislature.

Rubber Reclamation Factory for Ratlam

A Rs. 81 lakh medium size rubber reclamation factory sanctioned by the Government of India will be opened in the private sector at Ratlam in Madhya Pradesh.

The industry with a production capacity of 2640 tonnes will manufacture moulding powder out of old rubber pieces. The factory will start production in a year's time and offer employment to over 100 persons

Lenin in His Study

THE LITTLE MAN AT THE KREMLIN

Lenin, who like a good orthodox Marxist denounces all 'Utopians', has succumbed at last to a Utopia, the Utopia of the electricians He is throwing all his weight into a scheme for the development of great power stations in Russia to serve whole provinces with light, with transport and industrial power. Two experimental districts, he said, had already been electrified. Can one imagine a more courageous project in a vast flat land of forests and illiterate peasants, with no water power, with no technical skill available, and with trade and industry at the last gasp ? Projects for such an electrification are in process of development in Holland and they have been discussed in England ; and in those densely-populated and industrially highly-developed centres, one can imagine them as successful, economical, and altogether beneficial. But their application to Russia is an altogether greater strain upon constructive imagination. I cannot see anything of the sort happening in this dark crystal of Russia, but this little man at the Kremlin can ; he sees the decaying railways replaced by a new electric transport, sees new roadways spreading throughout the land, sees a new and happier communist industrialism arising again . .

As I revive my memories and size him up against the other personalities I have known in key positions, I begin to realise what an outstanding and important figure he is in history. I grudge subscribing to the 'great man' conception of human affairs, but if we are going to talk at all of greatness among our species, then I must admit that Lenin at least was a very great man.

The armoured car from which the call of Lenin sounded : 'Long live the socialist revolution '

An end to wars, peace among the nations such is our ideal the greatest possible number of the simplest and most obvious decisions that would certainly lead to peace

LENIN

On Planning

I like the feel of machinery, the look of it, but more and more, I have felt that from the point of view of balanced development, we have to lay greater stress on many small industries in our villages, make them slightly urbanised, lessen the gap between them and the urban areas and increase the facilities available to the people who live there, instead of concentrating on the towns and cities and drawing out people from the villages, thus creating problems in the cities . . .

One of our states which in comparison to others is more prosperous is Punjab where there is hardly any big plant, out there are plenty of small industries. Some states which are full of big plants are low down in the scale of per capita income, in spite of the development of industry, because agriculture is not developing

I am all for industry, I am all for steel plants heavy industries and all that, but I do say agriculture is far more important than industry Because, it is out of the success of agriculture that industry comes. If you fail in agriculture, you have little to stand upon Where do you get the wherewithal to have industry? It is out of the surplus from agricultural production that you build your industries and, therefore, it has become of the utmost importance that agriculture should flourish and should produce the goods and surpluses needed for industrial growth This point is very obvious but yet, somehow or the other, it does not seem to have caught the imagination of everybody

Agriculture is more important than anything else, not excluding big plants, because agricultural production sets the tone to all economic progress People seem to think that an industrial plant solves all the problems of poverty, which it does not. It has a long-term effect on the economy, no doubt However, at the moment, whichever way you start in India, you come back to agriculture. We dare not be slack about it, as we have been, I am afraid, in many places .

I am ashamed to confess that even today, in spite of every effort, there are areas of India where it is difficult to get good water to drink, and people have to go miles and miles to fetch a pot of water. If I may put it so, I should think the very first thing to do in social welfare is to provide water to drink. There must be enough food, clothing, housing, education and health. If we could provide all this to every inhabitant, it does bring a certain basic standard of living to everybody. Having provided that, we can try to raise this

Often our difficulty has been that we take up large schemes and talk rather big, but in implementing them we lag behind. This is not a good thing It is better to take up small schemes and complete them immediately. We want dynamism in our activity, in our implementation, not eloquence in our resolutions and in our discussions .

What is Planning? Planning is the application of your intellect to a logical, reasonable and better way of doing things. It passes my understanding how any person with a grain of intelligence can object to planning, because such an objection amounts to objecting to an intelligent approach to things. Whether it is economics or politics, or anything else, planning is essential . . .

It is easy to talk about planning in limited spheres of activity. Naturally planning for a whole nation involves infinitely greater effort than planning in bits. Planning, in the larger sense, is thus an integrated way of looking at a nation's manifold activities. In view of the fact that we function under a democratic set up which we have deliberately adopted and enshrined in our Constitution and in this Parliament, any planning that we do must naturally be within that set-up. The Planning Commission does not have right to draw up a programme that has no relation to our Constitution . .

Our plan . . must cope with the amalgam and variety we have in India.

This is the first attempt in India to integrate the agricultural, industrial, social, economic and other aspects of the country into a single framework of thinking. It is a very important step and even if the thinking is partly faulty it does not detract from the magnitude of what has been attempted and accomplished. It has made the whole country planning conscious It has made people think of this country as a whole . . .

We do not think that democracy, as is sometimes believed in other countries, means the economic doctrine of *laissez-faire*. That doctrine although some people still talk of it, is almost as dead as the century which produced it—dead even in the countries where people talk about it most . .

And when people say, 'You have been over-ambitious in regard to the Second Five Year Plan', I will reply that we propose to be over-ambitious everytime. It is that outlook that we wish to produce in the country not the outlook of caution and of creeping along slowly For the stakes are high. We dare not go slow—for we may fail completely by going slow

JAWAHARLAL NEHRU

The World View

It would be a tragedy if the two great countries of Asia, India and China, which have been peaceful neighbours for ages past, should develop feelings of hostility against each other We for our part will follow this policy, and we hope that China also will do likewise and nothing will be said or done which endangers the friendly relations of the two countries which are so important from the wider point of view of the peace of Asia and the world . .

We may get excited about the sacredness of the Indian soil and the Chinese people may get excited about something they hold sacred, if they hold anything sacred. But nothing can be a more amazing folly than for two great countries like India and China to get into a major conflict and war for the possession of a few mountain peaks, however beautiful the mountain peaks might be, or some area which is more or less uninhabited . . .

The House knows well enough how recent developments have created a wide gulf in the relations between India and China. We have felt strongly about it, and the House has also felt strongly about it Nevertheless, we have tried to avoid, insofar as we can, taking any steps which may create unbridgeable chasms between the two countries. We have to look at this moment of history, not only to the present but to the future ; and the future of India and China who are neighbours to each other and have vast populations, is of the highest importance to themselves and to the world.

Khadi must be taken with all its implications. It means a wholesale Swadeshi mentality, a determination to find all the necessaries of life in India. . . . It vitally touches the life of every single Indian ; makes him feel aglow with the possession of a power that has lain hidden within himself and makes him proud of his identity with every drop of the ocean of Indian humanity, of its economic freedom and equality and, therefore, ultimately, in the poetic expression of Jawaharlal Nehru, 'the livery of India's freedom'.

Mahatma Gandhi

Rehabilitating Nehru

FROM EARLY in his long political career, Jawaharlal Nehru was troubled by a nagging feeling that popular adulation may turn him into a spoilt child—which is another word for the despot. Thus did he write the famous letter denouncing himself.

Even at the height of the Gandhi era, when the half-naked fakir dominated the political scene, Nehru was the darling of the masses. His antagonists saw in him many timidities and hypocrisies, all of which made no difference to his growing popularity. His individual personality was not dwarfed by the presence of the Mahatma ; rather it drew sustenance from that august presence.

It is only natural that a person who occupied the centre of India's political stage for several decades should have been subjected to pitiless criticism both in his life time and after. The recent events in India have given these criticisms a sharper edge Not the least severe of the criticisms is that he was a creature of history, not its maker, that he was at best a well-intentioned liberal and at worst a romanticist ; that, if he knew little economics, he knew politics even less ; that he lived from compromise to compromise and finally from surrender to surrender. This criticism, muted in his early days of office, became more vocal after the mid-term appraisal of the plan till it rose in a crescendo at the time of the Chinese incident.

There was much malice in this criticism, which ignores the outstanding fact of recent Indian history, namely, that of all the great men whom the Gandhi era produced, he was the one chosen by the messiah to be the torch-bearer after his departure. "He will speak my language after I am gone".

Nehru did not exactly conceal his differences with his chosen leader. He found Gandhi intriguing and his ideas anachronistic. With a great vision of a modern, industrialised, liberal democracy—a product of the fusion of Locke, Montesquieu, St. Thomas Aquinas, Laski and Oxbridge—he could not accept the "naivette" of the village logic fervently pleaded for by the wandering friar. And Gandhi knew where exactly the preferences of his political heir lay.

Yet why did this "strange little man" want his mantle to pass on to this "reprobate" ? Herein, perhaps, is to be found the clue to Nehru's place in Indian history ; and that history cannot easily be wished away.

NEHRU SHARED with Gandhi the one quality which makes for universal acceptance in a country of diverse cultural backgrounds marked by extreme passions of one kind or the other—social, religious, linguistic and, of course, ideological. That quality was tolerance, gentleness, understanding, compromise, humility and, more than anything else, an abiding faith in the common people.

If Gandhi knew the virtue of firmness, he knew the greater vice of self-righteous zeal. "One step enough for me" epitomised his infinite patience. And in Nehru he saw the one man with a great missionary zeal tempered by respect for the opposite opinion even if that opinion was held dishonestly. Nehru was not explicit in subscribing to Gandhi's "ends and means" philosophy ; but complete acceptance of that philosophy was implicit in the manner of his evolution.

Others, with far less direct responsibility for the affairs of this vast and varied country, have dissected him into bits, but they perhaps have not been able to appreciate the value of his loyalty to the organisation, his innate discipline for the cause and his ability to keep together men of varied temperaments, beliefs, prejudices and purposes.

Others might have launched this country on the course of majority despotism and hastened its disintegration; they might have imposed their will and quickened the process of sullenness, they could have installed their state satraps and made India's democracy a grand imperial design; they could have relied on a narrow base of urban and rural oligarchy and robbed India of a distinctiveness in a "patterned" world; they could have plunged the country into an orgy of Gandhian solutions, without the country being prepared for it—a circumstance which Gandhi himself would not have bargained for, or they could have launched on a frenzy of industrialisation which would have led to a great serfdom of the country and its people.

THE GREATNESS of Nehru lay in his conscious acceptance of the limits of any single course of policy Hindi was the language of the struggle, even as Khadi was its livery, but neither could be imposed Socialism was a creed of urban liberalism but its passionate pursuit would have been at the cost of some basic values of Indian polity; "bossism" in the states might have been deplorable, but its abolition by a central edict would have led to the super boss, in the mean time, the great power of the central government in the constitutional scheme could be tempered by a conscious encouragement of powerful state bosses who could exert influence in what was inevitably a single party polity The oligarchies could not be wished away nor could the oligarchs be liquidated, hence the strategy of universal adult suffrage, the experiment of panchayati raj and gradualism in land reforms after the early speed in zamindari abolition.

Hiren Mukherjee called him the gentle colossus, the accent being on the word "gentle". It is this gentleness (not gentlemanliness) which marked him out as the unquestioned successor to the Mahatma

THE AUTHENTICITY of a conviction reveals itself only in a crisis He could have saved Krishna Menon, if he wished; he could have dissolved Parliament; in fact a non-official resolution pleaded for its suspension during the Chinese conflict His presence in the Lok Sabha during the thinly-attended debate on this resolution surprised many. The significance became clear when he rose to state his position Only in war, in times of national crisis, he said, should government function in the full gaze of the public, should Parliament be in continuous session In fact he extended the session There was an emergency which he scarcely used; there was the DIR which did not strike terror in his political opponents Newspapers could still write (maliciously at times, under foreign influence often) about the unshod soldiers, unequipped battalions, irresponsible generals, an incompetent prime minister and the "wailing woman' who lamented the fate of her progeny thrown to the Chinese "wolves" Nehru would not curb these criticisms; rather he would answer them patiently in the House, at news conferences and at public meetings.

All this does not mean that his record is not open to ruthless scrutiny. If he accepted "Siksha" and the giant American transport planes, he quickly recovered his stance; if he spoke in tones of panic about the threat to Assam, he did not run away from the consequence of political ignominy. He rejected Frank Antony's advice that Jawaharlal Nehru be brutalised, that the people of India be brutalised.

HIS ESSAYS in planning were not always rewarding. His industrial policy not only led to monopoly but to what Rajaji picturesquely called "permit licence raj". His panchayati raj became the paradise of the rural oligarchies. His elections gave rise to the ascendancy of money power; his constitution permitted the cavalier dismissal of state governments and dissolution of state assemblies; his own party became increasingly a flabby instrument fit neither for ethics nor for governance His foreign policy did not win him many friends His economic policy led to dependence and foreign domination of our internal affairs

And, amidst the wreck of his visions and dreams, stood the man himself, sad, disillusioned, bewildered, almost lonely There was no Gandhi to guide him, no Patel to lend him confidence, no Azad to counsel him, no Pant or Kidwai to ward off the cowardly attacks on a good man wronged "One by one, the captains depart", Nehru said in anguish when Sarojini Naidu passed away

Yet in this hour of his defeat, he displayed a quality which few in his position would have shown—the quality of complete commitment to the democratic process, even if it led to his personal embarrassment And it is the very state bosses whom his daughter was later to denounce, who, despite their lack of stature of the earlier titans, understood the supreme significance of the phenomenon called Nehru.

IF THERE were two periods of his prime ministership which brought out the essence of his personality, they were between 1947 and 1957 and again between 1962 and 1964 when he left us, almost the last of the great figures of the Gandhi era. Faced with partition, the exodus, the Kashmir war, the states problem, the rapid degeneration of the ethical character of congressmen, he still perserved with the Constituent Assembly, moved the "objectives resolution" (however valid the Royist criticism of this resolution might have been), decided to continue the association with the Commonwealth (here was the man, said Churchill, who had conquered hate), at one stroke made franchise universal, held an election, launched the plan introduced community development and panchayati raj, gave content to the politics of reconciliation, set his face against communal frenzy even after the martyrdom of the Mahatma, set the country on the road to industrialisation, curbed the linguistic fanaticism of the Hindi lobby while conceding the aspirations for linguistic states (only short-sighted men called this a tribal idea) and made the Congress accept socialism as the goal of its endeavour. And all this in the setting of a parliamentary democracy, judicial independence, unbridled freedom of the press and openness of society Patel had died in the meantime. More could not be said of any man in history. Alone, amidst a motley crowd of supporters and calumniators, in the gravest of perils any nation was ever called upon to face, he steered the ship of state on the safe course of development, democracy and decency.

And in 1962, even in April, when the election was over, he was unwell—so unwell that he could not attend the meeting of his party for the election of the leader. Then came the succession of attacks on his policy, the Chinese war, the growing foreign intervention, the entry into the Lok Sabha of Dr Ram

anohar Lohia, the relentless critic of the man and s politics, and the serious illness in Bhubaneshwar.

HOW MANY can recall the epic nature of his struggle against circumstance and physical fliction? His defence of the CPI resolution on the iinese question (the party had not split then) and e Chinese embassy's propaganda on our soil, his tervention to thwart the "operation scuttle" of his vn partymen on the company law amendment, his itient reply to Dr Lohia's scathing indictment of s economic policy, his readiness for a debate on the ree anna fifteen anna controversy raised by the Docr, his perseverance with the constitutional amendment protect the land laws, his speeches in the Lok Sabha eading for a long term approach of friendship with ir neighbours despite their hostility, his two speeches the Bombay AICC on Pakistan and China only a w days before his death an his last press conference hen, already broken in body, he said, "I am not ing yet" (this was only four or five days before the id came)—this was a fitting finale of a grand career, o ineffable to describe Was it a coincidence that died on the day of the opening of a special session Parliament to pass the constitutional amendment protect the land laws of the states? Or was it a preme act of sacrifice in the cause of the spossessed?

THE MOST uncharitable of his critics cannot deny that he sought to rescue our freedom movement om narrow and exclusive nationalism and salvage e one-world idea from vague sentimentalism He id little use for international cooperation as a mere cal. The objective had to be defined and the diffiilties understood He regarded the struggles and ontradictions of the day as very real, and his oneorld idea would not obliterate them altogether eace did not appear to him inconsistent with the onflicting social movements Freedom and non-exoitation were the essential premise for world ooperation If India were to surrender a part of her sovereignty to a world system, she had to be sovereign in the first instance. Thus, for him, the first thing was to establish a world of freedom, non-exploitation and non-interference. From independence to inter-dependence; from non-exploitation to cooperation; from non-interference to mutuality; and, in the meantime, peace based on justice.

The impact of Jawaharlal Nehru's ideas on the politics of his day was distinctive and decisive in many ways. Let us not seek to rewrite history and distort it. For all his follies, he was the one man who has made it possible for us to analyse his failures and build on his successes. Jawaharlal Nehru lends himself to the fiercest criticism, that is at once a measure of his legacy.

If we can think of Gandhian solutions, if we can think of greater federalism, if we can talk of a sensible policy for minorities—linguistic, religious or other—if we can talk of participatory democracy, it is because Jawaharlal Nehru greatly expanded the base of discussion Along with his seeming "misdeed" of pampering the urban consumer intelligentsia, lost to intellectual and moral courage, should be seen his contribution to the efflorescence of mass politics which will prevail and did prevail against the parasites of the towns.

And let not the Congress party or any of its leaders consider Jawaharlal Nehru to be their inheritance At least that section of the party which was responsible for or acquiesced in or even now defend the infamy of the emergency can have no claim to that priceless treasure of Indian politics

For the rest, this "jewel among men" is India's common inheritance even as the Indian National Congress which fought for our freedom is.

NEHRU AND GANDHI have become part of history, the legend and story and song and myth of our great heritage Our task now is to build an India where their values can be blended with the nobility of their life and work

First Signs of Policy

NEWSPAPER REPORTS that the planning commission may not encourage labour-saving farm achinery, coupled with the view attributed to rof. Raj Krishna that non-tractorised lands have been ound to yield more, indicate a refreshing approach to olicy. Labour shortages can be made up by migration rof. Raj Krishna appears to have committed the lanning commission to a firm policy against mechaniation.

Simultaneously the planning commission may be exected to assess the impact of this new approach on opulation policy. A view has been held that middle id small farmers do need more sons for farming as ell as for supplemental income through migration on-mechanisation should be accompanied by more igorous schemes of labour cooperatives or labour anks with guaranteed wages

Prof. Raj Krishna's clear reiteration of the new govrnment's resolve to start more and more public sector nderstandings in the core sector should silence critics. aturally, where jobs can be created otherwise and etter, a different policy will be pursued.

The professor has said that new technology based n use of labour is being developed; investment would be concentrated on industries based on forestry, poultry and dairying, area planning is being evolved; 500 development blocks would be taken up in the next two years and 2,000 more blocks in the succeeding five years under area planning for full employment This would account for almost half the country.

Prof Raj Krishna has also spoken of encouraging planning at the lowest level and involving voluntary agencies and educational institutions

He has made it clear that the size of the plan for the coming five years will be substantially bigger than that of the fifth plan He said that the planning commission had never before been more associated with policy-making than at present He referred particularly to the association of the deputy chairman of the commission with all important discussions of the cabinet. Without minimising the stress in the past on growth and self-reliance, he drew attention to the fact that not much headway had been made even here. The time has come for attention to employment, distributive justice, irrigation and labour intensive industries The proportion of the public sector would be maintained, even increased But the scope for massive employment has to be found not in the organised sector but in the un-

organised sector.

The point made by Prof. Raj Krishna, which will not go unnoticed, is that a certain economic analysis—of a type never before undertaken in this country since the advent of independence—is now going on.

Shri V. G. Rajadhyaksha, another member of the planning commission has chosen the correct expression—economic stupidity of the highest order—to describe the policy of exporting resources and importing inflation. Such a policy reflects "inability to generate indigenous demand". He has said that the greatest emphasis in the next few years would be on power generation and irrigation. In a speech in New Delhi he stressed the human aspect of construction activity, including the problems of those uprooted from their normal vocations and deployed for construction jobs.

All this, together with concrete steps for constitutional restoration, adds up to a coherent and workable policy as a corollary to the speedy, efficient and honest dismantling of the apparatus of cultural tyranny Prof. Raj Krishna and Shri Rajadhyaksha must induce the government to accept the imperative of a commensurate organisation and administration which will be able to implement this policy This is the area where previous policies failed.

And how are they going to control the bureaucrats who spurn small fertiliser plants, use of wastes and local initiative, and have a passion for the con trick of collaboration?

Sardar Patel and the Civil Service

TWO YEARS have passed by since the nation observed the centenary of Sardar Patel's birth. The big change in the political scene is bound to result in a revival of the controversy regarding the relative roles of Sardar Patel and Shri Nehru. The truth, however, would seem to be that in the initial years of our independence, we were fortunate that these two great national leaders were able to work together despite fundamental differences.

A discussion of Sardar Patel inevitably leads to his great administrative and political skill mixed with firmness in resolving for all time the problem of princely states. What is perhaps less discussed is his view on having some civil services as successor to the Indian Police and the Indian Civil Service.

It was Sardar Patel who strongly felt the need of some all-India services both as pace-setter cadres and as factors for national unity and integration. In the circumstances of his day, when suspicion of the ICS was great among Congressmen, there was some doubt about the wisdom of continuing what was then regarded as a colonial tradition. Shri Nehru himself had some reservations. However, the efficient manner in which the civil and military bureaucracy helped the political leadership sort out the numerous problems caused by partition and the princely states and the anxiety for preserving the nation's stability probably settled the issue at that time. As Home Minister, Sardar Patel had a decisive say in the matter.

Shri Jaya Prakash Narayan had always been opposed to the concept of an elite service with special built-in privileges. He called the top bureaucracy the most powerful trade union in the country. It is not surprising, therefore, that, in his message for this year's celebration of Sardar Patel's brithday, he has referred to this matter. He has said that, in offering certain concessions to ICS personnel, Sardar Patel did not take enough precautions to ensure that the newly constituted all-India service was not infected with the ills of the ICS. JP, however, has expressed the view that if the Sardar had lived longer, he would have moulded the central and state administrations in a fashion that things would not have come to "such a sorry pass".

What is this sorry pass ? In recent years there has been a controversy about the jurisdictional confusion between the political and administrative wings of government. The problem has been discussed in the UK also. Significantly, the criticism in the UK is about the Treasury's hold on the government. In both countries, the charge has been often made that the political will of the people is frustrated by the power of the bureaucracy.

It is significant that the kind of administrative system we have in this country does not obtain in many other countries. To facilitate the work of the Fulton Commission in the UK, the Association of Professional Civil Servants in that country brought out a study of the administrative system in six countries to drive home the point that the British system is not a necessary one

Strangely, the Fulton Commission's report was implemented in the UK and the Administrative Reforms Commission submitted its report in India almost in the same period. Equally strangely, till then the Home Civil Service in the UK was based on the Northcotte-Trevelyan report and the colonial civil service in India was based on the Macaulay report both of which were submitted in the fifties of the last century.

While some drastic changes have been attempted in the UK in the light of the developmental and political compulsions of the day, nothing of the kind has happened yet in India, despite the ARC reports The discussion has been greatly confused by the controversy between the "specialists" and the "generalists" so-called

The issue is, obviously, not one between functionaries. The real question is whether the administrative scheme, as so far practised, is still valid, particularly after the experience of the emergency A new value system cannot flourish with an out-moded administrative system.

Administration, in the context in which we live is a pivotal factor of society and a great change in its forms and styles will have a profound social consequence. It is in this light—not in the light of the sectarian demands of the functionaries—that a basic renovation of the administrative system has to be discussed.

Since the planning commission is engaged in an exercise for a somewhat radically new approach to development, it cannot ignore the organisational forms for giving the new approach a reasonable chance of success.

Food Production Increase : Plea Reinforced

DR. M. S. SWAMINATHAN'S statement that the present food surpluses conceal the low consumption levels in several areas reinforces the plea for a massive programme to increase agricultural output. Some critics had held the view that there was no need for anything more than marginal increases. Dr. Swaminathan said agriculture should not be regarded merely from the point of view of producing more food; it is an integrated enterprise to create more jobs in the

ıral sector and generate more rural income. Pro-
rammes aimed at full employment and increasing the
ırchasing power of the rural poor would lead to a
rowing demand for foodgrains. And since land is
limiting factor (there is always the reality of some
ırm land being converted for other economic uses)
roductivity will have to improve very fast. The re-
ırn on the investment in farm research has always
een satisfactory; and a fresh encouragement of basic
search in this field is necessary.

Rural Jobs

IDEAS HAVE been pouring in about how jobs may be found for the rural unemployed, ever nce the new government announced its policy goals. he Civilian Conservation Corps (CCC) of America as been cited as an example in a newspaper letter. his was created in 1933 by Roosevelt who "concei-ed of a dual reclamation scheme on a gargantuan ale—reclamation of wasting natural resources and ilisation of unemployed youth". It appears Roose-elt set up camps all over the country each of 200 ıen. Within years some three million men were ained. Besides improving land, the scheme stimu-ted local industry and business.

Schumacher's recommendation of the Buddha's ee-planting injunction to his followers had already een tried by the CCC with great success. Our rail-ays can do far worse than involving their men in this ee-planting and tending enterprise along the course f the railway lines. Erosion control, rehabilitation drainage ditches, conversion of low lying areas in illages into ponds with polythene lining—these can e tried to create assets and jobs

The reported emphasis of the planning commis-on on irrigation and water-management is to be elcomed in this context Extensive road building, ıral housing, rural sanitation must be taken up at ghtning speed. Gradualism will not help.

Then, of course, the village schools. The debate n deschooling can go on. But the school has a lace in a scheme both of employment and of bridging ıe culture gap between the villages and the towns raining can wait. Curricula can be developed in ue time. But schools, with a meals programme, nploying local matriculates at a modest wage must ome up here and now in tens of thousands

The ideas of a large number of patriotic men, reflected in articles and letters to newspapers, should not be laughed away by experts. Let us have courage to make mistakes and humility to accept others' wisdom.

Much of India's drudgery needs no great investment to overcome. It is not always a question of resources; it is often a question of attitudes.

Skyjacking

THE EUPHORIA over the success of the West German Commandos may not last, though the universal condemnation of terrorist tactics is a happy circumstance. Neither will, however, ensure that terrorism will end.

Often the terrorists are no more than adventurers. But quite sometimes they are men with a missionary zeal prepared to lay down their lives for a cause, good or otherwise.

The problem of modern government is that it is damn too efficient and powerful. Classical revolutions are difficult in this age of enormous governmental resources including electronic devices. Naturally, guerilla tactics and terrorism, pure and simple, are the only outlets of revolt against tyranny, supposed or real.

There are two courses only which can greatly minimise this kind of protest. The first is a great simplification and openness of government. The second is the preaching of Gandhi's ideas the world over. Even the most despotic force is powerless against an individual who defies the state and accepts the consequence of defiance. Instead of inflicting suffering on others, the rebel is prepared to suffer himself. This gives him both the opportunity of protest and the great advantage of generating a good measure of public support to his cause.

With all the frightening pace of science, technology, industry and state organisation, the futurologists may be reckoning without the human being in their Orwellian predictions. The Cassandras may have a surprise in store. Man refuses to be defeated; he has not been defeated yet. And, who knows the seeming incoherence of events has a pattern; and the world may be on the brink of a collapse of the state as well as industrial and technological organisation, just when it looks like consolidating its hold on the people.

Wages and Incomes : A Plea for Sense

KAUSHIK

PROFESSOR A. K. DAS GUPTA and Professor Nihar Ranjan Ray, members of the third pay ommission, in their minute of dissent—a model of ood English, terse writing, logic, realism and ima-ination—said, "We attach importance to the pay tructure not merely as provision for the needs of mployees or as stimulus to efficiency, but also as an ıstrument of social change. . . . In a free market, elative wages are supposed to reflect a system of ıdividual preferences. In a controlled economy, elative wages may be made to register a pre-deter-ıind system of social preferences. A pay commis-ion whose terms of reference are limited to govern-ıent employees alone is, no doubt.. an inadequate ıstrument of social change; we would need an over-ll wages and incomes commission. Yet we feel that he government, being the largest single employer of labour, might operate as a price-leader rather than a price-taker and check the wayward movements that are taking place in the rest of the organised market. We take the view that the system of social preferences to which the pay structure is to be related is already implicit in the policy of planned economic development".

Flowing from this premise are their clear guidelines for wage policy. They said, "In our scheme of social valuation workshop categories rank higher than the corresponding clerical staff. . . . Our concern for the skilled worker transcends the immediate problem of wages. We see in the improvement of the status of the workshop staff the possibility of a change in our social order and, in particular, in our pattern of education. We view with alarm the present craze for gradation and the growing congestion in our univer-

sities. We are anxious to see that our boys consider it worthwhile moving away from universities over to workshop training centres and polytechnics, of which there should be many more in our country than we have today."

THE SECOND guideline formulated by the professors was that the differential in the pay structure between the maximum and the minimum must be related not merely to two points but to two ranges. "We would fix our eyes on the contrast between the highest and the lowest pay scales". Thirdly, to quote their words, "We abhor discrimination in any form, except insofar as it is used as an egalitarian policy. There are privileges that certain departments or certain classes of employees (doctors, for example) enjoy under the government. We are in principle opposed to these privileges, even though they appear to be sanctified by tradition". Fourthly, they said, "We cannot persuade ourselves that on this matter of wage fixation, a policy of slow gradualism would be of much avail. If a change in the wage structure is to have an impact upon society, it has to be a visible change".

Referring to the severe constraints within which the third pay commission had to work, the professors gave primacy to the "pull from the unemployed and underemployed". They said, "The concept of a minimum wage cannot be abstracted from the general economic condition of the country....which presents a paradoxical spectacle of an economy in which the minimum wage, even as it is, in the organised sector, is higher than the average earning of the labouring population taken as a whole. The organised sector is able to sustain itself only at the expense of the unorganised sector...... While the economy is characterised in general by poverty and unemployment, there exist in its midst sectors which are maintaining an artificially high level of prosperity. The organised private sector enjoys a sheltered market, with customers, including its own top employees, having enough finance with which to feed it in a sumptuous manner. Monopoly and large distributional inequalities are the props on which this sector subsists, and it offers its managerial staff a pay which is unconscionably high... And there are public sector corporations whose activities are similar in character to those of private firms and where also an artificially high wage structure has evolved over the years. . . . That as high a pay as Rs. 10,000 per month (or more) should be allowed to persist in a developing economy like ours is an enigma to us. As we view the matter, it is because such high pay is maintained at the top, that the base has to be jacked up, if only as a concession to populist demand".

The professors also referred to the paradox of "transfers of our trained personnel, especially scientists and technologists to foreign countries" and simultaneous considerable unemployment among such personnel within our own country.

TAKING THE various factors into account, the professors said, "If, indeed, it were a wages and incomes commission and not one confined to the government sector, we would have urged it to suggest a general scaling down of top salaries when, as it happens, we find ourselves unable, in view of the severe economic constraints, to recommend any appreciable improvement in the pay scales of the bottom layer. The present ratio between maximum and minimum is, in our view, intolerably high, and the pace of bringing it down would be quicker if an attack on both fronts were feasible". The constraint was "the insufficiently regulated private sector . . . where fancy salaries obtain".

The professors endorsed the Administrative Reforms Commission's proposal that "preference for the generalists should give place to a preference for those who have acquired competence in a particular field". The professors objected to a long senior scale and the system of special pay.

The professors further pointed out, "You cannot have an egalitarian pay structure, much as you would like to, so long as the administrative structure continues to be hierarchical in character". Finally they said, "A sound pay system is a *necessary* condition of an efficient social structure but *not a sufficient* condition ; the *will to serve* is the other condition."

THE REPORT of these two eminent professors can (and should) be the take off point for the Boothalingam study group which has been asked to recommend linkages between wages, incomes and prices. The previous regime, which gradually reduced polity economy and administration to an exercise of the *danda,* treated the professors' document with a cynicism which marked the regime's growing unconcern for social values Speaking more in sorrow than in anger, Prof. Das Gupta said in July 1974, over a year after the pay commission had submitted their report "In spite of all the talk we hear about proposals for a national wage policy, my experience leaves me sceptical . . . We thought that the validity of our proposals was beyond dispute ; if a referendum were taken on the issue, I am sure our proposal would receive overwhelming approval And yet our government did not give our voice as much as a hearing I am still sanguine that even though conventional wisdom might shelve these proposals for a time, economic compulsions will bring them to the fore sooner or later Wage policy is an aspect of social relations Conflict is inherent in the situation. And yet, given the will, it should not be beyond human ingenuity to find a way ; knowledge is a solvent of social conflict. Alas the case is different where vested interests are allowed to prevail."

These vested interests have prevailed so far. The task before the Boothalingam committee is not one of "knowing" ; it is one of telling the government how the vested interests may be overcome.

OR IS it ? There is much sense in the criticism that Shri H. M. Patel, in deciding on a study group, is trying to evade the issue. A group can function within a framework of policy Expertise follows does not precede, policy directives, at least in this sector.

Many policy pronouncements of the new government, including those relating to the rural poor, clearly call for a low wage policy which clearly pre-supposes immediate action to curb high incomes in the public and private sectors. These decisions need not wait for any recommendations of any committee. A three stage policy can immediately be implemented, namely, a limit of Rs. 5,000 on emoluments (including all concessions) in the private sector to be brought down to Rs. 2,500 in five years ; a limit of Rs. 3,000 on similar emoluments in the public sector to be brought down to Rs. 2,500 in five years and a policy of administrative reform which will do away with hierarchies, "non-functions" "anti-functions", "super functions", "over functions" and "extra functions", simplify

policy advice and implementation, do away with the clerical class up to the level of secretaries and introduce a new culture of "doing", "building" and "producing".

As a first step government should immediately abolish all special pays, headquarters, deputation and non-practising allowances, selection grades and concordance tables ; make it clear that career management and promotion policies are inconsistent with a general policy of finding resources to provide worthwhile jobs for the unemployed and under-employed. Such a uniform policy for the generality of the organised sector would require political courage and without political courage, "expertise" can do little. Simultaneously, there must be a proclaimed policy of ceiling on profits and dividends and of mopping up surpluses for further investment in worthwhile projects. A firm "No" to bonus demands, to overtime allowances, to increased dearness allowances and to subsidies (except for the economically poorest sectors of society) requires not expert study but political decision. The organised sector, already better off compard to the generality of the people, must be asked to accept sacrifices.

THE DIFFICULTY so far has been two-fold. One, ministers and senior officials living in luxury did not carry conviction when they called for an ordinance of self-denial; two, the wages, as a proportion of productivity and production, have been going down without any simultaneous evidence of the resources generated by such productivity and production going into new productive ventures giving rise to more jobs and better distributive justice.

The new government, with its proclaimed commitment to Gandhi, must set the tone of a new wages, incomes, profits and dividends policy. This need not wait for the report of the study group.

Also, the new job opportunities—be it in health, education, information, engineering, or in any other area of public administration—should be outside the scope of present headquarter organisations so that a greatly decentralised, anti-hierarchical, easy-to-account, target-oriented system can emerge. All new governmental enterprises of a social, cultural or economic nature should be organised on the basis of local corporations functioning within a framework of policy and target, with job continuance being linked to performance. This will keep the new work force outside the competitive field of high wages , further this will put an end to any increase in clerical posts of secretaries, additional secretaries, joint secretaries, deputy secretaries, under secretaries and below. The present headquarter organisations and the staff should be allowed to wither away.

These decisions should be taken here and now There must be a policy announcement that, from now on, there will be no new secretariat posts ; even the present posts must be quickly abolished with the incumbents encouraged to go to the field. The minister's policy advising body should consist of not more than ten officers—drawn from the government or from outside—of equal but modest monthly salary, not exceeding Rs. 2,000. Policy should not be confused with execution which is a field function subject to evaluation by a small body of officers functioning in each Ministry.

These policy decisions must be based on the proclaimed philosophy of the new government in favour of field orientation away from urban pressure groups.

WAGES, INCOMES and prices are essentially a matter of political policy. Once this policy is determined, details can be worked out by experts. The reason for the failure of earlier efforts including the work of the Chakravarthi Committee is that the committee did not have a policy within which to frame its recommendations. The same mistake has been committed again.

Planning is likely to fail again if it does not flow from a coherent political philosophy and from the authority of cabinet policy. There are indications of policy in the terms of reference of the study group on wages and incomes They refer to low incomes in the rural sector and the need for investments in the rural infrastructure But this is not enough. There should be some prior decisions based on this policy.

The study group has been given six months to report. This means its recommendations may not have any impact on the coming budget, hardly three months away. In the mean time, government policies will be under constant sectional pressures. Therefore, there is urgent need of some big policy decisions here and now.

Any appeal to the patriotism or social responsibility of the organised sector will work only if the real wages of the lowest sections of employees are protected by a firm policy of dealing with rural and urban, agricultural and commercial oligarchies and with the high income groups and resist sectional demands. At the same time, schemes for massive employment of the rural unemployed, partly through "food for work programme" should be undertaken.

As Prof Das Gupta said, wage policy is an aspect of social relations. It does not stand apart. Equally, it must flow from a political philosophy. Gandhi preached austerity as a principle. Luxury consumption, for him, was an act of exploitation. Even if the present government did not wholly accept this view, austerity today is an economic compulsion.

As Prof. Das Gupta underlined further, "In adopting a national wage policy, you cannot lose sight of the artificial stimulus that high wages provide to our industry for the use of techniques which are economically inappropriate, considering how conspicuously our economy suffers from a shortage of capital".

LOOKED AT from any point of view the economy needs a policy of low wages. "Extravagant consumption is often equated with economic progress and inequalities of income which permit the existence of riches in the midst of poverty are often accepted as a necessary factor of growth. All this is a misconception. Luxury consumption is the result of economic progress, not its cause, and the rich contribute to economic growth not as a consumer but as a saver" The Boothalingam study group may well keep in mind this cardinal truth uttered by Professor Das Gupta who quoted Keynes, "Like bees, they (the early capitalists of the west) saved".

In India, to get a job is itself a boon. Trade union demand is in conflict with this stark reality. Wage policy cannot be reduced to a mere question of industrial relations, though these are important. The private sector's concessions to labour are compensated by "protectionist" policies and the pampering of an elite class which provides the private sector with a secure market. "A distorted production structure", said Prof. Das Gupta, "is matched by an equally distorted earnings structure".

Wage policy cannot be influenced by a sole concern with wage-profit relationships. Profits should be mopped up for investment. They should not be distributed as dividends or wages beyond a reasonable limit.

After all, wage demand is relative. If there is a general proof of austerity and stern dealing with ostentation from the President, ministers, senior officials, down to the clerks, from the landlords, businessmen, industrialists, shareholders, executives dow to the workers, the problem, formidable as it may appear at first blush, will be found to be reall simple.

ALL THIS implies sincerity in commitment to th Gandhian philosophy. This implies determination and courage. This is a function of politica leadership, not the task of the Boothalingam committee.

Wanted: A Second Republic

KRISHNA CHANDRA

"THE POLITICAL sovereign having reposed its trust in the legal sovereign, the doings of the constituent assembly have an aura of sanctity that legal ingenuity may be powerless to penetrate. But that is an unintormed approach to a filed strewn with various shades of legal landmarks."

These words of Mr. Justice Chandrachud in the election appeal concerning the former prime minister were uttered in the context of the emergency when the argument went along a certain course leading to constitutional despotism. The logic, more or less, was that the people were sovereign; which sovereignty was willingly surrendered to parliament; parliament, in its sovereign power, delegated this sovereignty to the executive; from this it was only a step to acceptance of the prime minister as the symbol of people's sovereignty; thus her consultation with, delegation to or complete dependence upon a "coterie" was itself not only constitutional but an expression of people's sovereignty.

All this is not in the realm of fevered imagination. This was and is the reality. And this must be traced as much to the nobility of founding fathers, whose nature did not permit of an exercise in a fantasy of demented megalomania, as to the extreme vagueness of the basic law of the land.

Mr. Justice Chandrachud said, "The Indian constitution is not like the American constitution, an instrument of few words. The range of topics it covers would bemuse any student of foreign constitutions which do not even skirt the problems with which our constitution deals in copious details. . .Those, to whose wisdom and judgment the constituent power is confined, will evoke scorn and derision, if that power is used for granting or withdrawing building contracts, passing or failing students or granting and denying divorces. But the electorate lives in the hope that a sacred power will not so flagrantly be abused and the moving finger of history warns of the consequences that inevitably flow when absolute power has corrupted absolutely. The fear of perversion is no test of power".

Though great prescience may be attributed to these words, the hope that a certain power, explicit or implicit, will not be abused is belied by recent experience

The learned judge said that if there are unamendable features of the constitution, which, beyond the pale of reasonable controversy, form part of the basic structure, one of them is that "the nation is governed by a government of laws, not of men". But when laws themselves could be bent to make a government of men possible, one has to see how this distortion of constitutional purpose can be eliminated.

The judge further said, "If the democratic form of government is the corner-stone of our constitution, the basic feature is the broad form of democracy that was known to our nation when the constitution was enacted, with such adjustments and modifications as exigencie may demand, but not so as to leave the mere husk o popular rule".

But then, the Supreme Court found even extreme adjustments valid. Is it not time to remove the ambiguity?

MAX RADIN said, "Those of us who have learned humility have given over the attempts to define law." Mr. Justice Chandrachud would not be daunted He said, "Forgetting mere words which, Tennyson said 'like Nature, half reveal and half conceal the sou within', the substance of the matter is the rule of the majority and the manner of ascertaining the will o the majority is though the process of elections".

But, have we not been exposed to frequent spells o President's rule in states for long periods and the extension of the life of a legislature even within the the prevailing law ?

With his penchant for the picturesque, the Judge said, "The swallow with its pointed wings, forked tail a curving flight and twittering cry is undoubtedly a harbinger of summer. . but to argue that the summe of totalitarian rule is knocking at the threshold is to take an unduly alarmist view of the political scene as painted by the (39th) Amendment. Very often, as said by Sir Frederick Pollock, if there is any rea danger, it is of the alarmist's own making".

Even while sharing this optimism, one may still like to see that the constituent power does not permit of a perversion like the 39th amendment or the projected earlier one (or is it later?) seeking to immunise a person from the legal process for offences, civil o criminal.

"EQUALITY IS THE faith and creed of our democratic republic and without it, neither the constitution nor the laws made under it could reflec the common concience of those who owe allegience to them... A constitution which, without a true nexus denies equality before the law to its citizens may, in a form thinly disguised, contain reprisals directed agains private individuals in matters of private rights and wrongs. The English Acts of Attainder beginning witl the one passed by the English parliament in 1459 after the commencement of the wars of Roses or the "Privilegium" in Rome are only some of the historica instances in point. Speaking of Bracton's famous passage which contains the admonition that the King ought to be under the law because the law makes him king, Sir Frederick Pollock says that there you have in a nutshell the great point of constitutional freedom tha law is not merely the instrument of government, bu the safeguard of each individual citizen's public right and liberties".

Yet law, as upheld by the Supreme Court, denied the citizen even a common law right to life, let alone liberty.

Are all of us as certain as the judge that "the rule of law means that the exercise of powers of government shall be conditioned by law and that, subject to the exception to the doctrine of equality, no one shall be exposed to the arbitrary will of the government" ? Was Dicey's prescription true in our case, that is, "The constitution is not the source but the consequence of the rights of individuals, as defined and enforced by the Courts ?"

The charm of the English Constitution is that it does not exist Ours does. Despite the guarantee of equality before law and equal protection o laws and the claim that its denial is the negation of the rule of law, was not the classification during the emergency so absurd as, in effect, to lead to the extinction of equal protection ot laws ?

"THE MOGHUL Emperor, Jehangir, was applauded as a reformist, because soon after his accession to the throne in 1605, he got a golden chain with sixty bells hung in his palace so that the common man could pull it and draw the attention of the ruler to his grievances and sufferings. The most despotic monarch in the modern world prefers to be armed, even if formally, with the opinion of his judges on the grievances of his subjects."

Was this preference evident during the emergency or was not its absence found to be within the constitutional framework ?

"The British Parliament in its unquestioned supremacy . could, with impunity, legislate for the boiling of the Bishop of Rochester's cook". And our Parliament could, perhaps, do no less !

'Whatever pleases the emperor has the force of law' is not an article of democratic faith. None is likely to disagree with the judge; but this, at least, seemed to be an article of constitutional validity.

Mr. Justice Mathew said in the same case that a power must be lodged somewhere to judge the validity of an election; in whichever authority this power is lodged, "it cannot be resolved on considerations of political expediency." Yet, in effect, retrospective amendment was precisely an exercise in expediency and was perfectly legal

He said, "A despotic decision without ascertaining the facts of a case and applying the law to them, though dressed in the garb of law, is like a bill of attainder. It is a legislative judgment." Yet the point is at best debatable whether the proposed immunity from legal process for all offences, sought through a projected constitutional amendment, would have been valid. Is it not time to make the constitution simpler, clearer and beyond possible equivocation ?

ST. THOMAS Aquinas said that since the end of law is common good, the law should be framed not for private benefit but for the common good of all citizens. Yet laws for private benefit have been found to be valid. John Locke said that those who wield legislative authority should govern by "promulgated *established* laws not to be varied in particular cases"

Mr. Justice Mathew said that "even if a power is given to a body without specifying that the rules of natural justice should be observed in exercising it, the nature of the power would call for its observance". Yet, after the decision on the *habeas corpus* case, one is in doubt about the citizen's common law and natural justice rights.

Mr. Justice Mathew said, "If the amending body evolved new norms for adjudging the validity of the particular election, it was the exercise of despotic power and that would damage the democratic structure of the constitution." Yet several laws could be placed beyond the pale of judicial review by the simple artifice of placing them in the ninth schedule.

The Judge recognised that "the major problem of human society is to combine that degree of liberty without which law is tyranny with that degree of law without which liberty becomes license." "It was Montesquieu who saw the light," by separating judicial power from legislative and executive branches. It is "not a theoretical, philosophical concept. It is a practical, work-a-day principle" Mr. Justice Mathew said (and this was during the emergency), "A sovereign in any system of jurisprudence is not like an oriental despot who can do anything he likes, in any manner he likes and at any time he likes....... ..The rule of law postulates the pervasiveness of the spirit of law throughout the whole range of government in the sense of excluding arbitrary official action in any sphere ...It is based upon the liberty of the individual and has as its object the harmonising of the opposing notions of individual liberty and public order".

THE WHOLE controversy about the emergency provisions of the constitution has to be seen in this light. It is not a question of "humanising" but of "abolishing" these provisions and evolving a system where, even in the worst of circumstances, the liberty of the individual is not arbitrarily taken away, the life of a citizen is not at the mercy of the executive and the rule of law never remains suspended even for a moment, not in a narrow, legalistic sense but in the sense of law as *established* by conventions as much as law *prescribed* by parliament.

Mr Justice Mathew has ruled that the suspension of the remedy for the enforcement of fundamental rights depends upon a valid proclamation of the emergency. It is government's duty to test the validity of what was done on the night of June 25-26, 1975

Mr Justice Holmes' observation that great cases like hard cases, make bad law has been quoted by Mr. Justice Khanna; which is why, apart from constitutional amendment, it may be useful to reopen the *habeas corpus* judgement in today's atmosphere which is not the same as the suffocating atmosphere of the emergency when almost every case became a *cause celebre*

IT WOULD be appropriate, at this moment when government is proposing to bring forward a measure to remove the obnoxious provisions of the 42nd amendment, that a whole new look is taken at the Constitution and its practice. Twenty-seven years is long enough period to have gathered sufficient experience. The upsurge of nationalism which was an outstanding contribution of the Gandhi era made for a strong centre. The maturity of politics within this nationalism may call for greater federalism There may be some merit in retaining the Rajya Sabha and the legislative councils not as second chambers but as bodies dealing exclusively with federal and sub-federal matters which may be outside the purview of the Lok Sabha and the assemblies There is scope for a federal government and for a federal judiciary as distinct from central government and the Supreme Court. A whole new look at the election chapter is called for. An integration of directive principles and fundamental rights may have to be thought of More than anything else the emergency provisions will have to be considered afresh, not merely refined Since the

inth schedule is under article 31 and since the Janata arty is committed to abolishing the fundamental (as ifferent from legal) right to property, the scrapping f this article may be necessary. This will automatically protect the property laws, since the right is not undamental The amending power of parliament may have to be restricted at least for a specified period f 10 or 15 years. The President may be retrieved rom ritualism and given some status of elder counsellor, subject, of course, to the cabinet system of overnment in a parliamentary democracy The provisions for the dissolution of state assemblies and ismissal of state governments may have to be reviewed in the light of the unsavoury record of the last wo decades There may be need to give statutory asis for panchavati raj institutions The language issue, unless subjected to a fresh scrutiny, may strike t the root of our polity.

MORE THAN anything else, the constitution should be made much briefer, much simpler It hould shed not only fat but ambiguity Today the onstitution is a paradise of lawyers It must become living symbol of people's sovereignty

The time has come for a second republic That is he meaning of the epochal events of March this year

---

Towards People's Involvement

SAHADEVA

SO MUCH has been said and written about the urban elite's responsibility to the rural poor for ome decades now that one wonders whether anyone —including the planning commission—is serious bout it. A running theme of sermons from those n authority is that development cannot be an exclusive government function. "Community effort", aided self-help", "voluntary agencies' role", "industry's debt to the people"—these are some of the hrases which have been bandied about.

But has government ever been serious ? Community development failed because there was more of dministrative tutelage than of community or deveopment Aided self-help has succeeded to some extent n recent years, but there are already signs of bureauratisation of the idea If voluntary agencies have done ioneering work, it is despite the government which ften takes a patronising approach to these bodies. And there have been complaints of political obstacle t the point where the work of these agencies threaens local entrenched interests And the few entrereneurs who try to develop the areas in a manner hat they may be set on the road to self-reliant growth re often regarded as "intruders" A recent newsaper article spoke of an SDO asking a well-meaning ompany executive not to extend the zamindari of e boss And, of course, there is a purely political and uninformed) criticism of any genuine effort by nyone.

The planning commission, undoubtedly, should be aving some idea of non-governmental agencies doing iverse jobs of rural development It is time an evaluation is done of their work, some decision taken on the kind of government support which will not dilute the voluntariness of the work or degenerate into patronage, some data are made known to the people and serious effort is made to involve, students, women, industrialists, newspapers and trade unions in rural development and in raising the cultural consciousness of the village people.

And while planning new infrastructures, the planning commission should consider how a village post office, communication centre, school, health centre and the rest can be integrated into a scheme which will be autonomous and outside the present omnibus headquarters organisations staffed by or looking after a mercenary bureaucracy whose prime concern is to preserve and further inflate their high wages. As and when new autonomous schemes based on target-oriented field staff without being subjected to hierarchical tyranny come up, the present headquarters organisations should disappear Supervision should be slowly handed over to identified voluntary agencies.

Low investment schemes with a high employment content it would seem, have been tried by a few voluntary organisations Some enterprising municipal bodies have taken up schemes for the use of waste for fertiliser and energy There are institutions trying to work out simpler and more efficient farm tools, simple sanitation methods, water purifying devices for villages, to mention only a few tasks of great social validity Solar cookers and windmills are being experimented upon

One of the vital tasks of the planning commission should be to evaluate these efforts and integrate them in the total planning process. Gandhi's main difficulty with electricity was that the people might be at the mercy of a few functionaries. If the planning commission believes that its efforts should be directed as much towards people's self-reliance as towards welfare, it should address itself to the tasks of promoting local skills, voluntary effort, social organisations, students involvement and similar objectives If the bureaucracy of the commission has other ideas, it should just be pushed aside

---

Ideal Villagers

We have got to be ideal villagers, not the villagers with queer ideas or absence of ideas about sanitation and giving no thought to how they eat or what they eat Let us not, like most of them, work anyhow, live anyhow Let us show them the ideal diet. Let us not go by mere likes and dislikes but to the root of those likes and dislikes If we should have electricity in every village home, I should not mind villagers plying their implements and tools with the help of electricity But then the village communities or the state should own power houses just as they have their village pasture. . . .The village movement is as much an education of the city people as of the villagers

—*Mahatma Gandhi*

Nehru's Heritage Must Be Defended

GIRISH MATHUR

TO COUNTER-POSE Gandhiji and Jawaharlal Nehru is to miss the essential unity in the thoughts of the two. They spoke different languages—not only were their idioms different, the concepts they used to indicate their goals appeared to be conflicting. Jawaharlal Nehru clashed with Gandhiji on many an occasion and entered into public debate with him. At times it appeared that their relationship had reached the breaking point. But the break never came. Nehru was often accused by his comrades of "compromising" with Gandhiji and "surrendering" to him for questionable reasons. Gandhiji's followers were never happy about his "weakness" for Nehru. What Nehru's comrades and Gandhiji's followers failed to see was that the two shared the vision of India they wanted to build That is exactly what Gandhiji meant when he said (while naming the socialist Nehru as his successor and not any of the loyal Gandhians who probably possessed better organisational and administrative skills) that he would soon speak his language

Those who accuse Nehru of an urban bias as against Gandhiji's advocacy of the village, seem to have forgotten that he regarded "metropolitan life" as an evil consequence of "modern industrialism and capitalist structure" which produced "biologically unstable societies" and resulted in "sterility and racial decadence". He held that as urban life "loses its vitality", people in big cities take to "more and more stimulants, drugs to sleep or to perform other natural functions, foods and drinks that tickle the palate and produce momentary exhilaration at the cost of weakening the system" That is why he thought that "with all its splendid manifestations and splendid achievements we have created a civilisation which has something counterfeit about it. We eat *ersatz* foods produced with the help of *ersatz* fertilisers, we indulge in *ersatz* emotions, and our human relations seldom go below the superficial plane" At the same time he held that "a village, normally speaking, is backward intellectually and culturally, and no progress can be made in backward environment, narrow-minded people are much more likely to be untruthful and violent" What he wanted was to "discourage this (metropolitan) overgrowth and, at the same time, encourage the village to approximate more and more to the culture of the town"

Neither Gandhiji's nor Nehru's ideas remained static. It will be wrong to quote Gandhiji's 1945 letter to Nehru that "I still stand by the system of government envisaged in *Hind Swaraj*" which he had written some 35 years earlier When Gandhiji was writing the letter he did not have the book with him, but it was not difficult for him to get a copy. Still, he wrote, "I have not *Hind Swaraj* before me as I write It is really better for me to draw the picture *anew* in my own words, and whether it is the same as I drew in *Hind Swaraj* or not is immaterial for both you and me" (emphasis on "anew" added) Gandhiji's talks with Louis Fischer before and after the Quit India movement show that his thinking about the kind of society he wished India to evolve had changed much since the early twenties, the man who in 1921-22 had rebuked some U P Congressmen for agitating against the zamindari system now justified the landless grabbing the vacant lands of the landlords and felt that if the landlords persisted in their attitude, the landless would overpower them.

JAWAHARLAL NEHRU's experience of the freedom struggle and the peasant movements in U.P. had led him to Marxism by the early thirties, but he rejected it by the mid-forties and gradually began moving to the approach which found expression in his *Basic Approach* and *India Today and Tomorrow* which he wrote in the late fifties If even after rejecting Marxism, Nehru could not shed its influence, Gandhi too remained under the influence of Ruskin and Tolstoy all along And it was not Nehru alone who was considered to be a modern man; G. D. Birla who knew Gandhiji and also the uses of Gandhiji for himself says that the Mahatma was more modern than he Both were western in their habits (punctuality, for instance) and both were essentially Indian to the point of being romantic about things Indian including the Indian peasant, Gandhiji being attracted by his simplicity and his purity and Nehru by the qualities he displayed in bearing sufferings and fighting for his due

Gandhiji's abhorrence for violence was shared by Nehru even if he did not accept non-violence as a creed. Gandhiji told Fischer, "I am a social revolutionist. Violence is bred by inequality, non-violence by equality" Nehru took a historical view of violence. He told the Lok Sabha in 1954, "Where upheavals occur they are products of history, and violence, defeat and civil war govern the subsequent events Some Hon. Members seem to think that in order to have progress they must destroy. They think that by increasing the conflict and bitterness they can have a clean slate to write upon No country has ever had a clean slate to write upon, not even after the biggest of revolutions. No one should deliberately destroy something which is worthwhile in order to build something which may be good in certain circumstances." His objection to communism was its emphasis on violence. "Communism charges the capitalist structure of society with violence and class conflict I think this is essentially correct The question is how to get rid of inequality and have a classless society with equal opportunities for all Can this be achieved through methods of violence or is it possible to bring about changes through peaceful methods? Communism has definitely allied itself to the approach of violence Even if it does not indulge normally in violence, its language is of violence, its thought is violent" He repeatedly said, "We want to do away with classes, but by the method of winning over people. I admit class struggle, but I do not want to aggravate it I do not want to be obsessed with it. I want to get rid of it as far as possible without aggravating it"

IT WAS precisely to avoid a violent eruption of class struggle in the country that Jawaharlal Nehru opted for a mixed economy He repeatedly pointed out that acquisitive society and the "free enterprise system" had outlived their relevance and were controlled and restrained even in the countries in which they first came up He emphasised that the "strongest urge today is for social justice and equality", and unless the state responded to it "it might well become a police state" But he also saw that fully controlled economies led to authoritarianism and totalitarianism which he

regarded as irrational growths. He was faced with another dilemma. From the historical point of view he saw that the 'shell' of the Indian system was capitalistic while its 'essence' remained feudal; in this context the slow pace of growth that would take place without the state taking on certain economic responsibilities would lead to "monopolies and aggregations of economic power." At the same time, he realised, as he told the Lok Sabha once, "the price paid for rapid industrialisation has been terrific in some socialist countries. I am certain no country with any kind of parliamentary democracy can possibly pay it". He wanted India to be a parliamentary democracy for various reasons, but he knew that "if there is economic inequality in the country all the political democracy and all the adult suffrage in the world cannot bring about real democracy." At one stage he was even prepared for adjustments in the political system to meet the demands of the task of building a non-acquisitive and egalitarian society, but he emphasised that "political democracy will only justify itself if it ultimately succeeded in producing these results"—by 'these' he meant economic advance in a manner that social tensions (including class war) were reduced and finally defused.

Mixed economy was his answer to the problem of planning economic advance in a democratic set-up. Besides, he believed that "change is essential, but continuity is also essential. The future has to be built on the foundations laid in the past and the present To deny the past and break with it completely is to uproot ourselves and, sapless, dry up". Mixed economy was to be his instrument of change without a break with continuity. Transition from feudalism had not been accomplished anywhere without a break caused by industrial revolution which had taken place in western countries before they took to democracy and in socialist countries in conditions in which civil liberties were not available to their citizens. It was an uncharted path that he took, and he made it clear that, for India, planning was to be a method of trial and error; he had no ready-made model before him but he was sure that India would learn from the mistakes of others. But mixed economy was not an end in itself As early as 1948 when he was not even sure of how to describe it ("call it what you like—mixed economy or something else"), he was clear that it was to be a "transitional stage of economy". He also felt that the transition was not to be smooth. "I rather doubt myself whether it is possible without a conflict or repeated conflicts to bring about these changes because people who are used to possessing certain interests or certain ideas do not easily accept new ideas, and nobody likes to give up what he has, at least no groups like it; individuals sometimes do" His doubts were not unjustified, during the years since he spoke, the conflicts which, he thought, would arise did come to the fore resulting in distortion in the path he sought to pursue.

AT THAT point of time, or later, in the course of the advance on an uncharted path it was not possible clearly to visualise the picture of he social system which would finally emerge from the mixed economy. Nehru sometimes called it the socialistic pattern, at other times socialist pattern, and on other occasions simply socialist society, but he made it clear that the three phrases meant the same thing—a casteless and classless society. He was seeking an alternative to capitalism and communism, possibly, as he himself put it on one occasion, a synthesis of the two. Way back in 1949 he declared that the way to progress in India "need not necessarily be an extreme method belonging to the two rival ideologies (of capitalism and communism). It may be something in-between. In fact, you find in the world today, in most countries, there is an attempt to find other ways which certainly are completely divorced from the old style capitalism and which go towards what is normally called socialism. It may be that in India also we may be able to find some way more suited to the conditions of our people, some middle way". Although he had to be vague, even ambivalent, about the shape of things to come, he was quite clear that "as the socialist pattern grows, there is bound to be more and more nationalised industry, but what is important is not that there should be an attempt to nationalise everything, but that we should aim at the ultimate result which is higher production and employment."

INDUSTRIALISATION WAS one of the issues on which Nehru came to be criticised by those who called themselves Gandhians. Inaugurating the Perambur (Madras) Integral Coach Factory on Gandhi Jayanti in 1955, he said, "Perhaps some people might wonder what is the connection between Gandhiji and this big factory, for apparently he was not enamoured of great factories and thought much more of the village and the home. I feel that this idea is due to a basic misapprehension. I am quite sure, if we had the good fortune to have Gandhiji with us today, he would have been glad at the opening of this factory Many, I suppose, took the letter of what he said and paid little attention to the spirit, to the underlying philosophy for which he stood". Nehru never had any doubt that "India has to be industrialised as rapidly as possible And industralisation includes, of course, all kinds of industry—major, middling, small, village and cottage. However rapid our industrialisation may be, it cannot possibly absorb more than a small part of the population of this country in the next ten, twenty or even thirty years. Hundreds of millions will remain who have to be employed chiefly in agriculture. These people must, in addition, be given employment in smaller industries like cottage industries and so on". He went on to say that "we have to develop the village and cottage industry in a big way, at the same time making sure that in trying to develop industry, big and small, we do not forget the human factor. We are not merely out to get more money and more production. We ultimately want better human beings"

Differences of semantics and rhetorics apart, both Gandhiji and Nehru sought the same ends It was not a coincidence that towards the end of his life Gandhiji wanted Jayaprakash Narayan to be the Congress president while Nehru's choice was Narendra Deva although JP was quite close to him. Nor was it a coincidence that even after JP left the socialist movement and formally embraced Gandhism, Narendra Deva continued to speak in the language of Marxism, although the differences between the two socialist leaders at that time were only those of style and not on fundamentals. (Later, like Nehru, Narendra Deva never approved of the socalled cultural freedom campaign which JP joined.) Still, the Gandhians insist that Nehru gave up the Gandhian path (as they interpret it, going by the letter of what Gandhiji said and ignoring the essentials of his thinking), and to substantiate their point they accuse Nehru of neglecting agriculture. The charge is belied by the allocations for

agriculture and allied subjects like irrigation and rural development in the annual budgets and the five year plans during Nehru's life time. At the theoretical plane, agriculture was the major plank of the mixed economy which Nehru advocated. On one occasion he said in the Lok Sabha, "People talk of the public sector and the private sector. Does the House realise that the overwhelming part of the private sector is the private sector of the peasants in India? That is the real private sector in our country, not the few private factories we have". And he told the audience at the Perambur function to 'remember that perhaps the biggest scheme in India is not this big factory or hundreds of other big factories, but the hundreds and thousands of community projects that are changing the face of India today" He spoke in glowing terms about these projects whenever occasion arose

NEHRU'S ENTHUSIASM about the community projects did not prove to be well-placed which, however, does not show that he was callous towards the needs of the rural sector. In fact, his pre-independence political career bears out that he knew the peasantry better and was more sensitive to its problems than those whose reputations rested on their peasant origins or who later claimed to speak for the peasant masses because of their rural backgrounds. In U P it was under his personal leadership that the Congress took up the cause of the peasantry in the twenties and the thirties, and it was on his insistence that the provincial Congress undertook enquiries into agrarian conditions and initiated tenancy reforms long before independence. Indeed, it was the ground prepared under his leadership which enabled the Congress ministry in U.P. to be the first in the country to abolish intermediaries in land after independence When the city-born and bred Nehru came in touch with the U P peasantry during the agrarian struggles of the early twenties he was disturbed by its "progressive pauperisation" and wrote, "I was filled with same and-sorrow —shame at my own easy-going and comfortable life and our petty politics of the city which ignored the vast multitude of the semi-naked sons and daughters of India, sorrow at the degradation and overwhelming poverty of India".

The community development programmes did not yield the expected "revolutionary" results largely because these were not accompanied by land reforms Nehru had all along maintained that in India land was the central issue, and after independence he missed no opportunity to express his annoyance at the slow pace of land reforms which had acquired greater urgency because of the food problem He wrote in the *Basic Approach*, "Land reforms have a peculiar significance because, without them, more especially in a highly congested country like India, there can be no radical improvement in agriculture. But the main object of land reforms is a deeper one They are meant to break the old class structure of a society that is stagnant" In most states even the abolition of intermediary interests was not taken in hand till a decade after independence. In some it was held up by judicial processes. In others like U.P., where it was undertaken, it made hardly any difference to the old class structure, feudal relations remained entrenched and new vested interests came up. In some states, even now, land records have not been fully compiled ; there are regions where unofficial estimates of concealed tenancies cover almost 80 to 85 per cent of the holdings, and in others share-cropping still flourishes. Official studies reveal that the benefits of various schemes for agricultural development and technological improvements could not reach the needy and were appropriated by the new vested interests which had developed as a result of the half-way house land reforms ; these interests, in fact, have blocked the extension of land reforms and frustrated land redistribution. In his life time Nehru fretted and fumed but could do nothing about it.

JAWAHARLAL NEHRU had been in office for barely five years when he felt constrained to remark that "there is hardly a country where the gap between ideals and performance is so big as in India." The occasion was a discussion on planning process. His concept of centralised planning did not mean some people sitting at the top and drawing up plans. As he told the planners, "A slight fear seizes me as I see all this planning and organisation. We might begin to think, as many of us are apt to do, sitting in big buildings and big offices, it is we who are doing the job We are doing nothing of the kind. We are only indicating how the job is to be done". For him the main question was "how to involve the people", and he sought to draw upon his experience of the mobilisation of the people during the freedom struggle. However, the lack of mobilisation effort—to put it dfferently, the manner of mobilisation—has gone against the interests of the small and landless peasantry and, as the so-called green revolution shows, it has taken a direction which is against Nehru's belief that in agriculture machine-power is to be complementary to manpower It has also had the effect of vitiating the path of industrialisation he had laid when he repeatedly emphasised the need for balanced development of different sectors of industry—heavy, medium, small and village. When his attention was drawn during the third plan discussions in Parliament to industrial advance becoming lop-sided, he agreed that it was so and asked the House to "correct it" But his critics, despite their veneer of Gandhism, thought only in terms of the prevailing methods of production, organisation and motivation. As a result, they set private sector norms to be emulated by the public sector laying emphasis on profitability as understood in the private sector When Nehru talked of the public sector acquiring commanding heights in the economy he was thinking not merely in quantitative terms but also in terms of the public sector setting norms and pace for the private sector and making it accountable to society. Social responsibility of the private sector was the essence of Gandhiji's trusteeship theory.

In fact, the path of development as envisaged by Nehru and contained in the model which carries the name of Prof Mahalanobis was accepted only in parts, and even in these parts it was distorted in course of implementation. An example of distortion is the case of coal mining which had been reserved by the industrial policy resolution for the public sector. Eight years after the resolution was adopted, Nehru disclosed that "many state governments have gone about distributing licences widely to private owners and now we find that we are tied up with these licences...Our coal policy has been affected very much by the manner in which the state governments have proceeded. But we do not want to do anything now which will come in the way of production". To cite another example, for Nehru, land ceilings and redistribution were the centre-pieces of the land reforms programme, but what happened to land-ceilings is known to everyone. Economists would ascribe these distortions to "compulsions of economic development" while the political scientists would explain them in terms of in-built resistance of the power structure

4 DPD/77 4

and the pressures generated by political linkages

Nehru's emphasis on growth with social justice envisaged not merely increased production but a system of distribution aimed at reducing disparities. But the redistributive aspects of Nehru's path were either not accepted or distorted. As a result he found himself faced with the question : Where had the 42 per cent increase in national income and 20 per cent increase in the per capita income generated during the first and the second plans gone ? Another result was that production pattern took an elitist turn which was not unnatural since the half-way house land reforms had not opened up the vast rural market and had not generated effective demand in the countryside

THE MAHALANOBIS enquiry into the emergence of monopolistic trends was the first step taken by Nehru to correct the distortions. He also sought to secure acceptance of the aspects of his strategy for growth with social justice which had been resisted till then The country-wide debate he initiated on the national goal to spell out the steps towards socialism as he visualised it, culminated in the Bhubaneswar Congress resolution. But he was not to live long, and his initiatives remained unpursued ; the result is the crisis in which our economy finds itself today Even so, he has left behind a rich record of achievements and a rich heritage Foremost among his achievements was that he put us on the road to independent economic development. It is on that road that we have to go, but further advance is possible only if we know what went wrong and where Without identifying the mistakes and seeking their correction, it is difficult to defend his heritage and carry it forward It has to be defended and carried forward □

It is to this temper of peace that I want especially to direct my mind and your mind. We are in the midst of an international crisis and, perhaps, even a greater crisis that confronts us today is the crisis in the spirit of man We have built up a great civilisation and its achievements are remarkable. It holds the promise of even greater achievements in the future. But while these material achievements are very great, somehow we appear to be slipping away from the very essence of civilisation . .

We live in an age of paradox and continuing crisis We talk of peace and prepare for war. We discuss internationalism and One World and yet narrow nationalisms govern our activities. There is said to be a conflict of ideologies and this argument and the conflict that flows from it usually take place without much thought of the ideals and objectives that should govern us We move from one temporary expedient to another, never catching up with the pace of events. Priding ourselves on shaping history, we function from day to day as slaves of the events that inexorably unroll themselves before our eyes and fear possesses us and hatred follows in its train.

If we seek peace we must labour for peace and not for war If we seek harmony and goodwill among the various peoples of the world, we must not preach or practise hatred It is true that there is plenty of violence and hatred in the world today and we cannot permit this to triumph, as we cannot submit to any aggression We have to combat evil and aggression; in doing so, we have to remember not only our aims and objectives but also that the means we adopt should be in conformity with them

Jawaharlal Nehru

Shadow-boxing on The Economic Front

BALRAJ MEHTA

A DISQUIETING feature of the current national scene is the shadow-boxing in which politicians are freely indulging on the problems of economic policy and planning. The leaders of the new ruling formation in particular are very much prone to this pastime. This stems from the false idea entertained by many among them that, representing as they do a dramatic and in many ways an unanticipated break with an entrenched political set-up which ruled the country for thirty years, they were called upon to offer an equally devastating rejection and repudiation of the social and economic development goals and processes of the past years. This sentiment is articulated often in naive an dsometime also in grotesque forms. It will, of course, be equally pointless to raise the counter-cry of a danger to the so-called established national policies and the preservation, as if, of the national heritage itself The upshot of all this contention is to vitiate and stultify any meaningful effort to come to grips with the real tasks and the challenges which have to be faced

The fact to be reckoned with is that the processes of planned economic and social development have been stalled for well over a decade The periodic exercises in reorientation and recasting of the plans and the instruments of planning and implementation to suit political exigencies and pressures and the fanfare surrounding these exercises during the previous regime and again under the present political dispensation have been only a good enough cover not to plan at all and still less to honour the obligations and discipline that planned development demands

CUTTING CORNERS

The fact also to be recokoned with is that the Indian economy made a significant headway in the first decade of the planned development effort between the mid-fifties and the mid-sixties. But there has been virtual stagnation afterwards Rates of savings and capital formation which had picked up in the earlier period showed sharp deceleration in the subsequent period The current consumption in the last ten years has been, therefore, sustained largely by running down real assets built earlier, without replenishing them The Janata government has, for this reason, inherited an economy with limited reserves to draw upon. To put the economy back on the growth curve will, therefore, be a difficult and arduous haul Populist slogan-mongering will not be, as it never was, a good enough substitute for meaningful and integrated effort This should have become clear enough to the Janata leaders even during the brief seven months they have held the reins of government. The pity is that this does not seem to have happened and the more the difficulties they encounter the stronger is the tendency on their part to cut corners and shout slogans

Indian people, after their painful experience of the past many years when they were fed by promises of *garibi hatao* to begin with and slowly pushed to undergo the horrors of the 19 months of the emergency, are not going to be easily taken in by similar gimmicks by politicians all over again.

It is silly to talk of employment generation or of social justice in isolation from the overall pattern and level of economic activity in society. It will, therefore, not do, as was done from time to time under the previous regime, merely to set aside certain sums of money in the government's budget for special employment schemes and measures of relief and to make pompous claims on that basis.

The net effect of such shortcuts can only be that while a selective number of people may get doles or nonproductive employment, employment potential and availability of goods and services in the overall will be adversely affected and available resources, financial and physical, which are not in plenty, will be diverted from investment and productive activity. At the same time, inflationary pressures will be generated and will in due course assume virulent form and proportion. Any attempt to look for easy options in order to win short-term kudos will give disastrous results—social, economic and, finally, political

PRESSURE GROUPS

The first requirement of any meaningful planning is to conserve resources Subsidies in various forms and of different kinds will have to be decisively withdrawn. The pricing policies will have to be adjusted so that the costs of goods and services rendered by the state are fully recovered from those in urban as well as rural sectors who take advantage of them Full returns from public investment will have to be ensured so that surpluses are generated for further investment Additional resources will have to be mobilised from sources where additional incomes generate, such as the producers of marketable surpluses in industry and agriculture These are precisely the imperatives of development which are still being neglected.

What seems to be missed is that any tendency towards sacrificing the requirements and demands of development in order to satisfy the demands and requirements of sections, groups and classes which might be regarded as constituting the support-base of the government at any point of time and with a view to widening and consolidating that support-base has to be determinedly combated This, of course, requires a rare political courage on the part of the party in power There are no signs of it yet

Certain disturbing tendencies, on the other hand, are showing in political as well as in economic and social approach and outlook. Such controversies as claims of industry versus agriculture, of small industry versus heavy industry and so on in the allocation of financial resources are not only false but are also a cover for the entrenched vested interests seeking to advance their position in the economic and social structure They also divert attention from the imperative of development planning and fundamental structural reforms in agriculture and industry which are necessary for the growth of the economy on a sustained and steady basis

OBSESSIVE CONCERN

It is suggested by the votaries of higher priority for agriculture that the past plans have proved a failure because the planners have been pumping more financial resources into industry, especially heavy industry, and starving agriculture of funds and investment It is argued that this resource allocation pattern should change and agriculture should have higher than its traditional share of around 25 per cent

in the total financial size of the plan.

Such obsessive concern with financial quantities in the system of Indian planning is misleading and cannot possibly explain the failure of planning, which is general and pervasive and is not confined to the agriculture sector. It is a manner of reasoning which might be of interest to the lobbies of vested interests operating at different points in the economic structure but provides no rational or sensible insight into the problems of India's social and economic development.

It is, indeed, a distortion of reality to say, especially after 1960, with the launching of the new agricultural strategy, that agricultural development has suffered on account of greater priority for industry in the allocation of resources. The resource distribution has, on the contrary, been a far bigger constraint on industrial investment. The worst hit, of course, has been the social service sector.

So far as the agricultural sector is concerned, the direction of resources in its favour has been considerable and impressive. It is not at all enlightening to compute this in terms only of the sectoral allocation of plan funds. There have been years of crash programmes for agricultural production with their accent entirely on additional budgetary allocations to achieve quick results which, of course, always failed to materialise. Though the commercial banks still remain oriented towards providing working capital needs of the industry, agriculture has begun to claim a sizeable share of bank credit.

Shift in Favour of Agriculture

But the most important change has been a decisive shift in the terms of trade in favour of agriculture through a deliberate policy of "incentive procurement prices", especially of foodgrains. The huge incomes derived by surplus farmers on this account have been supplemented by the rich farmers during the years of comparative shortages by black market sales of their grain hoards. The higher incomes that have accrued to surplus farmers have, moreover, been tax free. They have been, in addition, getting subsidised supplies of various inputs, among them irrigation, power and fertilisers. The huge investments in irrigation, power and fertilisers, therefore, do not give returns and are actually showing big losses so that resources for additional investment in these infrastructural facilities have to be drawn from other than those who benefit from them. It will be also more useful and to the point to look at the state of affairs in the agricultural sector in terms of the material inputs that go into its development. The injection of material inputs into agriculture under the new agricultural strategy, if carefully assessed, would appear to have met, and in some cases even exceeded, the plan targets.

The reason for the failure of agriculture to achieve targets of production, and even more its failure to provide adequate surpluses for the market at reasonable prices during years of shortages has, therefore, to be found elsewhere than in inadequate allocation of funds or material inputs under the plans. This is important also because the kind of financial incentives and material inputs that have been relied upon under the new agricultural strategy will be more difficult to find now than was the case in the last ten years or so. The energy crisis has a close bearing, for instance, on the supply and costs of inorganic fertilisers. The economy is so denuded of surpluses that any further diversion of resources from other sectors to agriculture has become very difficult.

It is indisputable, of course, that strains in the economy cannot be relieved and the stability which is essential for economic development to make any headway cannot be restored unless Indian agriculture is able to produce adequate surpluses. The question, however, is whether it is at all possible to achieve this objective by mere allocation of more plan finances at the risk of further decay in social services and stagnation in industrial investment.

Need for Structural Changes

There can be no avoiding or evading of far-reaching institutional and structural changes if accelerated growth on a durable basis is desired. A broadening of the social base of agricultural production and productivity, freeing the pattern of investment and production from the present tie-up with the consumption requirements of upper classes and expansion of employment are, indeed, the imperatives of a sound economic development policy. The solution of India's economic problem can also not be found by relying on sophisticated fiscal and monetary instruments, without structural changes in economic and social relations. The idea that the deadlines for completing the land reforms or at least the distribution of surplus land under the ceiling laws can be set from time to time and then conveniently ignored, that the investment and production pattern can be left to the market forces to determine, that trade in foodgrains and wage goods can be left for the private enterprise to regulate and that even conventional tax measures to raise resources for public sector investment can be dispensed with has simply not worked in the past and will not work again. Experiments in these directions only sharpen the basic contradictions in India's economy and society □

THE BEAUTY OF INDIA

India with all her poverty and degradation had enough of nobility and greatness about her, and though she was overburdened with ancient tradition and present misery, and her eyelids were a little weary, she had "a beauty wrought out from within upon the flesh, the deposit little cell by cell, of strange thoughts and fantastic reveries and exquisite passions". Behind and within her battered body one could still glimpse a majesty of soul. Through long ages she had travelled and gathered much wisdom on the way, and trafficked with strangers and added them to her own big family, and witnessed days of glory and of decay, and suffered humiliation and terrible sorrow, and seen many a strange sight; but throughout her long journey she had clung to her immemorial culture, drawn strength and vitality from it, and shared it with other lands.

Today it (India's old culture) is fighting silently and desperately against a new and all-powerful opponent—the *bania* civilisation of the capitalist west. It will succumb to this newcomer, for the west brings science, and science brings food for the hungry millions. But the west also brings an antidote to the evils of this cut-throat civilisation—the principles of socialism, of co-operation, and service to the community for the common good.

It may be that when India puts on her new garment, as she must, for the old is torn and tattered she will have it cut in this fashion, so as to make it conform both to present conditions and her old thought.

JAWAHARLAL NEHRU

Ram Manohar Lohia-His Life and Thought

Dr. Parimal Kumar Das

IT IS a measure of change, brought about as a result of the historical events of March 1977, that after a decade of his death, Ram Manohar Lohia is being talked about, for as he once said, "people would listen to me but only after my death". 'Doctor Saheb', as he used to be affectionately called by his innumerable admirers, was an original thinker, an erudite scholar, a prolific writer, an intellectual of extraordinary brilliance, and yet, a man of the masses in its truest sense. He was a prince among patriots and a universalist as different from metropolitan A relentless fighter, a socialist crusader against all kinds of injustice and inequality between the rich and the poor, the Brahmin and the Sudra, the white and the coloured, man and woman, Lohia was the initiator of a non-Marxist radical movement in India as well as in the world Even when Lohia thought of "communism as the latest weapon of Europe against Asia", he was neither anti-Marx nor pro-Marx. Deeply rooted in Gandhian ideas and values, Lohia's thoughts steered clear of governmental, as well as, monastic Gandhism. His was heretic Gandhism For in his own words "Gandhism as opposition was revolutionary in its own fashion , as government, it is most staid, respectable and colourlessly conservative"

To comprehend Lohia, it is essential to understand his philosophy of history. To him, "all human history hitherto has been an internal oscillation between class and caste and external shift of prosperity and power from one region to another' Unlike Marx, Lohia saw a causal relationship between class and caste According to him "what distinguishes caste from class is immobility that has crept into class relationship . class is mobile caste Caste is immobile class". Lohia's outlook on civilisation had taken him to the examination of the direction of organisational or technical efficiency in every society or civilisation. "Man", according to Lohia, "stands before the choice of hitting out into yet another direction of maximum efficiency or walking into a state of total efficiency". To a visionary that Lohia was, the new civilisation would unfold itself as an "attempt to achieve approximation of the human race and the overcoming of class and caste and regional shifts through comparatively equal production in all the world" In the making of this new civilisation, both capitalism and communism are equally irrelevant Even though capitalism and communism differ in respect to the "relations of production", the "mode of production", in both the systems, remains the same. Both are the products of the same technology. "The like debacle of capitalism and communism is equally understood, when they are viewed as parts of a single civilisation that appears to have neared the end of its voyage". Hence, the ingredients of the new civilisation, in the words of Lohia, would be, maximum attainable equality, maximum geographical distribution of power, social ownership, small unit technology, a decent standard of living within national frontiers, a maximum privacy of individual life protected from all collective encroachments, and world parliament and government".

THE TWO important offshoots of Lohia's theory of 'total efficiency', are the small machine technology in the field of economics, and the idea of 'preferential opportunity' as distinct from 'equality of opportunity', in the realm of social relationship. Lohia's persistent demand for banishing English from public life and as a medium of instruction and its replacement by the Indian language was also a part of his desire to increase the 'total efficiency' in Indian society. Much maligned and equally misunderstood during his lifetime on the language question, Lohia itemised "the three distinguishing features of the ruling class in India : high caste, wealth and English language, and the combination of any two of these makes a person belong to the ruling classes of the country".

"Equality of opportunity" in a traditionally unequal society is deception and essentially a doctrine of status quo. Hence, "preferential opportunity" to scheduled castes and tribes, backward classes, the socially backward among the Muslims, Sikhs and Christians and women, is the kernel of Lohia's schemes of social engineering.

Yet another dimension of his theory of "total efficiency' is his concept of the political structure of a "four pillar state", that is, of governments at the level of centre, state, district and village. "It is both a legislative and an executive arrangement. It is a way of life and prevades all spheres of human activity, for instance, production, ownership, administration, planning, education, and the like"

A strong advocate as well as a practitioner of non-violent civil resistance, Lohia believed that "the present century has known only one originator, Mahatma Gandhi, and only one discovery, the atomic bomb". "Civil disobedience both as individual's habit and collective resolve is armed reason, and anything else is either weak reason or unreasonable strength". The stirring words of Lohia would still ring in the ears of his countrymen, when he declared, "It is not necessary for the people suffering from starvation or large scale dismissals to depend on parliament or to wait expectantly for another general election They have this priceless, matchless weapon—civil disobedience—in their hands when injustice and oppression go beyond bearable bounds When constitutional methods have proved incapable of achieving redress, it should be open to the people to violate unjust laws and wrongs and injustices that are inflicted upon them".

LASTLY, LOHIA'S ultimate objective was to accomplish the seven revolutions, with a view to establishing a new world order These revolutions are for man-woman equality, against caste, against productivity imperialism, against the exploitation of the poor by the rich, for demolishing inequality springing from skin-colour, against armament and against encroachment by the collective in the domain of the individual.

I referred to the great unity in the country, which is a wonderful factor. It is not unity of parties so much as the unity of hearts and minds. The million faces of India all bear the same impress today, whatever community or party he or she may belong to.

JAWAHARLAL NEHRU

Where is the Age of Fundamentals ?

IF DR LOHIA was guilty of sparing the causes and spoiling the result, have others done better ? Many in India thought that the British withdrawal, followed by the adult vote, would lead to the sovereignty of the people, whereas it has largely led to the privilege of the elite And planning in India, with all its understanding of the role of the expanding public sector and of the growing heavy industry, admittedly, has taken us nowhere near socialism Even if the poor have not become poorer, the disparities have increased and the entrenched classes have entrenched themselves further

Attacking the causes, therefore, is not as easy as it may seem, it is not merely the understanding but the method that provides the answer There is only one method which will abide The people must be made aware of where the threat comes from Without this awareness, they will lose the battle every time as they have lost the battle in India so far

Dr Lohia's great contribution to Indian political action lay in his ability to promote this awareness His three annas-fifteen annas controversy did a lot more to arouse people's awareness than volumes of dialectical dissertation In raising this, he was not attacking the symptoms but was clarifying issues in a manner people can understand

If one sought only to go to the causes and remedy them without a commensurate public understanding of the processes of socialist action, one would soon find oneself outsmarted by the classes who can always confound the people with slogans of transient popular appeal. That, in a measure, was Nehru's tragedy Soon every institution which he created to protect the people became an instrument of the entrenched sections.

Banner of Revolt

From this premise, Dr Lohia built his philosophy of debunking Here, too, he was fundamentally concerned, not peripherally occupied "You have to liberate the people from the imprisonment of established ideas before you can take them forward", he used to say

In economic matters, he limited himself to a few issues He was for a limit to incomes · he argued against ostentatious urban spending. While he was for modernised production, he was against modernised consumption, that is, he raised his banner of revolt against the huge structures of Delhi, the car and the refrigerator.

Much of this seemed irrelevant, odd and superficial, yet he was going to the core of the matter.

He was not cavilling at the urban upper middle class prosperity. His was a deeper concern. The complacent approach to incomes and urban consumption flowed from a system whereby planning, instead of becoming a people's movement, was reduced to an "exercise" in "projections" and "perspectives" by a few experts The "efficient" idea without the continuous backing of people's participation was bound to result in compromises and adjustments to suit the pressures of the parasitic urban upper middle class The public sector has remained the bureaucratic sector, not the people's sector How will anyone effectively meet the criticism that between monopoly and state capitalism there is little to choose? And is it not true that the elite of Delhi has had a lot more to do with with our politics and economics than the vast masses of this country, the intelligentsia not excluded ?

Only those who speak of growth rates returns, inefficiency and the rest seem to be occupied with the symptoms If one were really to trace performance to first causes, one would find that the basic weakness was in insulating planning from the people Wiping every tear from every eye is not done by expertise alone Gandhi said that when we are in doubt, we should think of the poorest man in the country and ask ourselves if what we are about to do is of any benefit to him.

This advice does not mean that we reject efficiency, what it does mean is that efficiency should always be subject to the people's needs If this had been so, we would not be talking knowledgeably about "recession", "demand and supply" and a "glut" in cement and steel when people languish for want of houses, hospitals and schools; nor would we be speaking of a shortage of nurses and doctors when so many of our young men and women despair of doing anything worthwhile.

It is a poor way of honouring a man's memory to ask that his ideas be accepted after his passing. But it is worse not to consider if, after all, he might not have been right

CIVIL SERVICE NEUTRALITY

The idea of a public servant sitting in a world apart and doling out impartial justice is completely out of place in a democratic society. It is especially so in a dynamic democratic society. The pace at which society moves forward depends on the people, and if there is no intimate connection between the public servant and the people, he will not move forward even if he is efficient The whole conception of the public servant in India has in the past been a static conception. Doing one's job as efficiently and adequately as possible, and impartially, was the conception in British times. Civil service neutrality is a fiction which I have often wondered at I have not been able to understand how any thinking person can be neutral In a period of dynamic growth, we want as civil servants persons with minds, with vision and with a desire to achieve We want persons who have initiative for doing a job and who can think how to do it Can a person be neutral about the basic thing which the state stands for, namely a socialist pattern of society ? Under a democratic form of government different political parties come into power at different times, and I can understand that the civil servant should not be partial to any one party But he cannot be neutral about the basic issues I am not quite conversant with how the civil servants in Britain adapted themselves to the advent of the Labour government I happened to be in Britain about that time, and I heard the bitterest complaint from the Labour leaders about the attitude of the civil service I remember with what extreme feeling Prof. Harold Laski spoke to me about it ... In India we are in a stage where future development depends upon the acceptance of certain basic assumptions and on intelligent, prompt and quick action What is the civil servant to do in such a context ? Naturally he cannot be a partisan of any one party. But must he be inactive and without any view of his own on basic matters ?

JAWAHARLAL NEHRU

SIDE TRACK

Of Human Vegetables, Proteans

NITISH R. DE, WRITNG in *The Hindu*, speaks of our administrative hierarchy with a range which "may even surpass the combined protocol mystiques of the Vatican and the astonishingly complicated self-initiated role of global peace-keeping mission of the Pentagon."

Searching for "types", he comes across the "human vegetables category"—the status quo ante type, playing safe with rules and precedents, shunning risk, afraid of a new situation and seeking to emasculate newness by caging it into "an old time-honoured system of notings in files". They have ambitions, likes, dislikes, emotions and even views They do want good postings and positions and their *forte* is assessing and conveniently using the mood of the boss. The quality of political life or decisions does not concern them, "unless, of course, it affects them personally in an adverse way" Time is not a critical factor for them save when there are compulsions from above. Order is to be brought by the weight of routine, social change is a matter of high policy and once the policy is handed down, it is their job to programme it with all the corners cut, with all the imponderables ignored and trained incapacity asserted They can be linked to inert gas which, as we know, is not without utility.

Then Nitish De spots the Proteans trying to 'understand the metereology of administration, how the wind blows, from which direction and with what velocity" Understanding the dynamics of the power game, they make efforts "calculatingly and purposely to fish in troubled waters", with a cynical disregard of the niceties of the rules of the game, of ethics which "are a synonym of worthless emotionality" Means are but a ladder to an end, the end essentially being built around self. The Proteans change in their behaviour, in their loyalties, in their symbols of speech, to manipulate a culture of false realities so that they can make the best of any situation. "Fidelity is not part of their value system". "In one regime, they drink power in the corridors of New Delhi; in another, the martinis of Washington They have heads"

The third category, "the growth seekers", possess the "mental virus" of achievement, "but they are neither the 19th century robber barons nor the 20th century jungle fighters" "The public aspects of public policy motivate them," they "seek personal growth in tune with larger social objectives, they possess the qualities of head and heart" "They warm up to innovative ideas, gear their energies to new exciting possibilities and respond to meaningful challenges". For them the solution should "lead to a dynamic system design so that the problems do not recur". They try to be increasingly able to learn continuously, seeking to create the same conditions for their colleagues, doing things but not using human beings as fodder. "They manipulate situations but not men" "Their strength lies in owning up their own inner dynamics . . To them, a career is an opportunity to work, to contribute, to learn and to grow"

Naturally, since so much is said of them in this context, Nitish De refers to Albert Speer and Robert McNamara—who accomplish set (of course, vast) tasks with remorselessness pushing aside whatever comes in the way like 'disposable paper napkin" They belong to 'the tradition of jungle fighters" They have the characteristics of all the three categories mentioned earlier. "Now such types are rare". In any event, they cannot survive in Indian administrative ethos.

If the popular expectation is "that our administrative leaders should be super stars", the vegetables and Proteans (who, probably, constitute "the majority of our dramatic personae") cannot make the grade. "With the growth seekers, it may be a different story As is the situation, they are few in numbers".

Thus do we find "the entropy law operating in the field of administration Whereas entropy is a natural and irreversible process, the negation of entropy is not. It calls for efforts, imagination risk-taking and the ability to anticipate turbulent environment and development of corresponding styles of administration, simultaneously flexible and humanly non-manipulable".

Nitish De (perhaps with most "watchers" of the species) does not find it surprising that "our administrative culture slowly and steadily deteriorates and instead of reaching, step by step, to a higher level equilibrium, cascades down to a lower level of equilibrium" Of course the system does not die, it leads an ailing existence with continuous infusion of oxygen and transfusion of blood More and more financial and human resources are poured in to maintain the same level of performance and, at times, ruefully, "a lower level of performance" Naturally Nitish De's preference is for growth seekers who are "our pearls and, indeed, the hope"

And of Con men and Suckers

WHILE NITISH DE looks at the present, Sunanda K Datta Ray writing in *the Statesman*, looks back beginning with Conan Doyle's Gilchrist "a fine scholar and athlete, plays in the rugby team and the cricket team for the college . a manly fellow", only he was "weak and dishonest" Therefore, off to the Rhodesian police where he "undoubtedly trades on his father's title" Sunanda Datta Ray's point is that "colonial society cannot in its innocence, be expected to tell rejects from marketable commodity" As with men, so with goods "Mccabe's clocks, once fashionable in India, came here only because the firm did badly in a British competition" Thus, Datta Ray, "with apologies to Shaw", says that "those who can, do it at home: those who can't, take abroad their indifferent accomplishments" Macaulay described Clive as "a dunce, if not a reprobate", who was "shipped out because he was good for nothing else"

Not Indians alone were taken for a ride, says Datta Ray Americans, "like Indians and other mental colonials still treat British insignia with awed respect" And Russians too It is not Britain's con trick alone that the author speaks of "It is only when foreigners place an exorbitant premium on the English language that the most insignificant Englishman becomes a prize catch". Datta Ray laments that "this aspect of what Mr Raj Narain calls 'English language imperialism' is usually ignored because it reflects embarrassingly on our own artificial values". "The British mask remains unripped because our posturing plays up to that facade The expatriate's

sham of erudition or elegance or whatever, is flattering to local self-esteem, suggesting that lucrative careers in London have been sacrificed so that great gifts can be placed at the service of a foreign race .. The ordinary British graduate's gin-drenched and time-worn cliches are received with the veneration due to classical profundities".

Datta Ray underscores his point, namely, that so long as "westernisation remains the social goal in Asia and Africa", the expatriate "will not be shown up for the shabby, third-rate misfit that he really is"—to the extent that a failure at home could aspire to be the governor of Bengal

As with men and commodities, so with companies, collaborationists with a "philanthropic" mission and international "experts".

Who can say that there is no link between the proteans (not the human vegetables, of course) and these "adventurous", "enterprising" and "generous" expatriates with their goods, wares and even wiles which may not work at "home"

May be there is more to it than being just gullible Do the proteans not "change in their behaviour, in their loyalties in their symbols of speech, to manipulate a culture of false realities, so that they can make the best of any situation"?

And Shri Raj Narain may be saying more than what he means when he speaks of foreign language imperialism. Once English goes, may be even foreign collaboration may go and we will be self-reliant in more than one sense, provided, of course, Hindi does not make for a new kind of "expatriate" within the country

A Deserving Award

The Amnesty International has won recognition for its creditable work in the cause of human liberty and political prisoners and other prisoners of conscience. The award of the Nobel peace prize is a fitting tribute to its 16 years of work. Its President, Mr. Sean Macbride, got the Nobel peace prize in 1974 In the last seven or eight years alone it adopted over 13,000 new prisoners and got over 8,000 of them released.

The Amnesty's role in the cause of Indian democracy and rights of political prisoners should be an added reason for the warmth of Indian response to the award.

Sanjaya

The Great Democrat

CHARAN SINGH

NATION BUILDING, especially in the context of the situation obtaining in a country like India, is an arduous task. We required a Gandhi to lift us from the slough of despond and diffidence that slavery had pushed us into. We required a Sardar Patel to inspire us to unite and realise our inherent strength. Similarly, we required a Nehru to instil in us all the essential ingredients of democracy and human values.

In the glorious era of India's resurgence, each of these titanic figures has their own rightful place. Neither any dust of current controversy nor any din of later day disputations and debate can deny their claims.

Panditji played a historic role during the freedom struggle , later, he led the country for nearly 17 years as Prime Minister after independence. During each of these distinct periods, what he did mattered vitally.

This year's observance of Panditji's birth anniversary is invested with added significance. Only eight months ago, in March 1977, millions of our countrymen—illiterate, poor and afflicted by years of neglect and deprivation—almost unanimously stuck a blow against those forces which had chosen to range themselves against everything that Jawaharlal stood for. It was a vindication at once unique and without parallel The tragedy of the situation was, it was Panditji's daughter—and, therefore, one who ought to have been a legitimate heir to his great legacy—that had wantonly tried to deny the people the precious gift her illustrious father had bestowed. Indiraji proved disloyal to her great father; but the people unequivocally stood true to him.

Nehru's commitment to democratic ideals brought about in him several obvious contradictions. A confirmed socialist, he could not compromise on the question of individual rights. His association with the sophisticated urban elitism, with obvious western leanings, did not deter him from firmly implanting the concept of universal suffrage on the Indian soil. Invested with undisputed powers, he never persuaded himself either to silence opposition or to ignore differing views.

I have publicly taken the position that Panditji's social and economic policies were not in consonance with our factor endowment. Even when he was alive I had stated my opposition. But to differ with him was itself a great privilege One can quote from his own later day writings and speeches to prove that he was having second thoughts about his economic policy, which he had stoutly championed earlier

TRAGICALLY, Panditji's detractors came from those very sections which benefited from his policies Businessmen, industrialists, urban professional classes and foreign collaborators were among those who were ranged against him in his greatest hour of trial during the Chinese aggression The masses chose to stand by him and by the country.

Here is again a lesson for us all. Our loyalty to the Father of the Nation, to his heir's democratic heritage and concern for the poor should compel us not to succumb to the pressure lobbies of foreign collaboration and narrow-minded urban organised sector We should ignore these pressures and be steadfast in our resolve to serve more than eighty-five per cent of the down-trodden people living in our villages as also in our towns.

This is our best tribute to the memory of Nehru.

We are a great country, a country with enormous variety, a variety that is good There is no reason why we should be regimented and be made to look like one person We should keep the variety, but that variety is only good when we are united and there is an essential unity behind it.

JAWAHARLAL NEHRU

Master-Plan for Water Management

T. D. VAISHNAV

INDIA is a land of paradoxes. Areas which reel under drought at one time experience devastating floods at another. Both bring untold miseries to the inhabitants of the area and entail heavy recurring expenditure to meet the situation.

UNEVEN WATER DISTRIBUTION

India is neither deficient nor abundant in water resources; only their distribution over the land is uneven. This is due to the seasonal and regional uneven distribution of rainfall Most of the rainfall occurs during the 3-4 months of the monsoon season During rest of the year, it is insignificant. Regionally, the northern and eastern parts of the country receive heavy rainfall as a result of which the rivers in these areas cause flood havoc while the western and southern parts receive light and uncertain rainfall and are hence drought-prone. For example, while some of the hilly regions of Assam receive as much as 500 inches of rainfall in a year, the arid zones of Rajasthan desert get even less than 5 inches

On an average, India receives, in all, about 300 crore acre-ft. of rainfall in a year, sufficient to submerge the entire country in a 45 inch deep layer of water This is adequate to cater to the irrigational and water-supply needs of the land But this cannot be achieved unless unevenness in seasonal and regional distribution is overcome.

SOVIET AND ISRAELI EXAMPLES

We can take a cue from Israel which has made deserts bloom through development, management and optimum utilisation of its scanty water resources within a very short space of time. In U.S.S.R, the implementation of the multipurpose Volga-Dnieper canal network has completely transformed a vast tract of barren land into a virtual granary

The total area under cultivation in our country is of the order of 390 million acres out of which only 100 million acres is provided with irrigational facilities. The remaining is still at the mercy of rain. Again, out of the 100 million acres, only-two third is under assured and systematic irrigation while the rest depends on small wells, ponds and tanks, which are, if anything, highly undependable in the years of scanty rainfall.

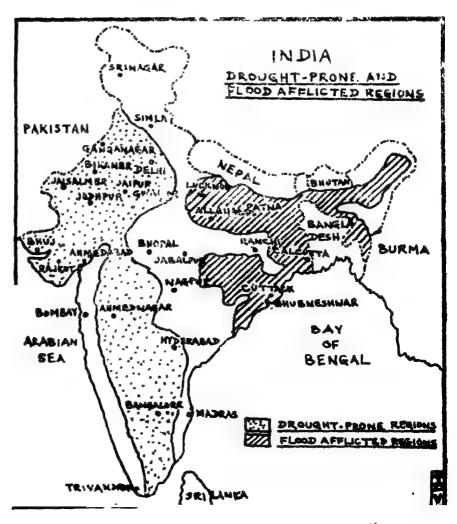
Some 88 districts of Rajasthan, Gujarat, Madhya Pradesh, Maharashtra, Andhra Pradesh, Mysore and Tamil Nadu—forming nearly one third of the country's total area—have economies that sway with the yearly vagaries of the monsoons. The percentage of irrigated land in these districts is far below the national average

It has been estimated that the total irrigation potential of the country is sufficient to provide assured irrigational facilities to more than 220 million acres.

Many parts of the country are perennially suffering from acute water scarcity while more than three-fourth of the total flow of our rivers wastefully drains into the seas without being put to any fruitful utilisation *It is this enormous quantity of unutilised water which causes havoc by inundating vast areas in the northern and eastern parts of the country, in the rainy season.* The mighty Brahmaputra's entire annual flow of 400 million acre-ft. of water runs into the Bay of Bengal.

The utilisation of the ground-water resources is equally bad. The entire useable ground-water resources of the country have an estimated annual potential of 180 million acre-ft. This quantity can fill a tank 500 miles long and 100 miles wide to a depth of 5 ft. At present not even a quarter of this is being utilised. Studies by the Geological Survey of India over the past decades have revealed that adequate quantity of ground-water could be made available in many parts of the country and used to supplement areas deficient in surface waters by digging deep bore and tube-wells.

NATIONAL WATER-GRID

It is very essential that our resources are judiciously utilised to avoid floods and droughts The proposal of a national water-grid of which the Ganga Cauvery link canal forms the first link is a step in this


work of feeder canals will be spread all over the country to transfer surplus waters from the areas of plenty to areas of scarcity. This gigantic project, when implemented in full, will not only cater to the irrigational needs of the drought-prone areas but also help ward off floods.

Another proposal recently put forth is the scheme of underground reservoirs. Under this scheme a considerable quantity of flood waters of the rivers would be stored in big-size underground reservoirs, in wet season, by means of induced percolation or artificial recharge. This stored water would then be pumped out in the dry season for water supply and irrigation purposes, thus starting a continuous cyclic operation of these tanks.

Both these proposals require a colossal amount and electric power for their implementation which could be made available by developing secondary power in the Himalayan region.

National Calamity

The twin problems of droughts and floods are national problems and should be dealt with as such. No inter-state river water disputes should be allowed to come in the way of a permanent solution to this problem. Water should be declared a national asset and there should be free inter-basin transfer of water from surplus to deficit areas. □

Rural Bias For Banking

K. RANGACHARY

IN pursuance of the present Government's objective of giving higher priority to rural development than hitherto, possibilities are being explored for reorienting the lending policies of the nationalised banks to enable them to make an impact on the rural environment.

Some time back, the Reserve Bank of India set up a committee to study the working of the public sector banks, with particular reference to their policy of expansion of branches and supply of credit to the priority and weaker sectors. The views of this committee will be of great use when the final policy decisions are taken.

In statistical terms, there has been an impressive sixfold increase in total bank lendings for agriculture and other "new priority sectors" since the nationalisation of the 14 major banks in 1969. According to latest economic survey, the share of these sectors in total bank credit has gone up from 15 per cent in 1969 to 25 per cent in 1976. However, this is not as impressive as it looks.

An evaluation by the Reserve Bank of working of the lead Bank Scheme in Maharashtra and Gujarat had shown that the lead banks were not displaying sufficient leadership or initiative in the districts in their charge. The results were uneven in particular, they were not doing enough for assisting the small and marginal farmers or agriculturists in non-irrigated or rainfed areas where crop risks were greater. Nor were they helping to promote subsidiary rural occupations in animal husbandry or processing schemes which could create incomes for the weaker sections in off season.

Structural Causes

The Congress Government's decision three years ago to set up rural banks was also an admission of this weakness of the public sector banks and of the partial failure of the primary objective of nationalisation in 1969 which was to help agriculture and rural development. The failure was attributed to structural causes which increased the costs of extending commercial bank credit to the rural sector.

The rural banks scheme is also now being reviewed and the Government may well prefer to watch their performance for some more time before taking a decision to expand or scrap them. All these illustrate the complexity of the problem of making banks a major agency for rural growth and employment.

There is also the larger question of how much credit expansion they can safely undertake and at what rates of interest in the present price situation when overall restraint is needed to prevent credit being used to finance non-productive or speculative types of activities.

The Union Finance Minister has emphasised the importance of branches on systematic lines by concentrating and by establishing at least one branch in each community development block. Today, there are over 24,000 bank branches in the country as compared to only about 8000 in 1969, of these 8000 branches are located in rural areas and another 7000 in semi-urban areas which are close to or in the midst of a group of villages.

Naturally branches cost money for staff and premises and these costs must be justified by the scale of their operations in terms of deposits and advances. Growth takes time but at least after a period of four to five years these operational costs must be covered by each branch to facilitate further expansion in new unbanked centres.

According to the last Reserve Bank annual report on currency and finance, rural bank branches, which constitute one-third of the total, had mobilised only 8 per cent of all deposits by June 1975 and had provided barely six per cent of the total volume of advances.

Needs of Agriculture Ignored

Another significant point which emerges from that report is that only 35 per cent of the advances of rural branches were given to agriculture, indicating that bank officers find it easier to evaluate non-agricultural schemes than crop-loans. It also appears that semi-urban centres often give more loans to agriculture than the rural branches themselves perhaps because this is given to the bigger landholders who offer good security and have contacts at these levels.

All these features indicate the importance of consolidating the existing branch expansion and the need for evolving new guidelines based on recent experience. It was suggested at a recent meeting that state governments should be consulted on the location of branches; one hopes that this will not lead to opening of offices merely to please influential persons even if the prospects of business in any area are not in the opinion of the banks, sufficiently promising. There should be proper yardsticks for such assessments.

Deposits mobilisation should be a major objective of banks in irrigated areas, as the farmers there grow highly profitable crops like wheat rice, sugarcane or cotton, while purposeful lending may be the main task in the less prosperous districts. Many well-to-do farmers also tend to use their own resources for crops

went up and do not need institutional credit.

Such variations in the rural banking operations suggest that there can be no rigid credit-deposit ratio applicable to all rural units, like the 60 per cent suggested at the recent meeting. This can be an overall average ratio but in particular centres it can vary between 50 and 80 per cent.

There can be little doubt that the drive for rural deposits should be intensified in areas where procurement operations and trading in surpluses are large; the additional resources so raised should be ploughed back as far as possible in the same areas in helping the weaker farmers and other poorer sections Such a policy can reduce the inflationary effects of expanded rural credit

Choice of Personnel

For all these activities bank personnel must be well chosen and trained State Governments can also do much more than they have done so far to identify appropriate schemes and areas in which banks can make a positive contribution Besides simplifying procedures, there should be sound credit planning, prompt evaluation of proposals and follow-up action to facilitate proper servicing of loans and recoveries In all these aspects of their working banks need the support of state agencies.

State and district planning authorities should commission periodical techno-economic studies of regions and sub-regions and offer banks the co-operation of their own extension

It is unfair to lay the entire blame on banks for all existing shortcomings in the absence of such support. Sometimes they have to contend with conflicting advice from the authorities On the one hand they are asked to restrict credit limits in order to control inflation and on the other to expand credit to the priority sectors, even when outstandings keep rising, especially when small units become sick or bad crops in any year make recoveries difficult Banks have shown reasonable prudence and taken initiatives in the areas they understand well, like small industries, road transport schemes, dairy and sheep farming, horticulture and so on

Role of the Co-operatives

The co-operative system still provides nearly half the present volume of institutional credit for agriculture and also substantial resources for agro-based processing units or industries like sugar mills or cotton ginning and oil crushing

The role of co-operatives is generally overlooked while putting pressure on commercial banks to do more, though co-operatives should be in a much better position to understand rural problems Many of these issues were generally avoided hitherto in the enthusiasm to show results in purely statistical terms, of branches opened and credit given to the priority sectors The present Government can adopt a fresh approach to the role of banks in an integrated strategy for rural development. □

Floods and Their Control

IN OUR COUNTRY, floods cause damage of about Rs 1500 crore every year. Sir Jesmy Raisman once observed as early as in 1945-46 when he was the Finance Member of the Viceroy's Executive Council that "India's budget is a gamble in rains" Perhaps, this is true even today When Dr. Rajendra Prasad was the President of India he said he was distressed to see the havoc and fury of the monsoon bringing in its wake incessant floods We learn from records how in the past history of our country cities and towns, rural habitations and fields with crops were devastated on innumerable occasions because of downpour, floods and resultant effects.

Floods are generally caused because of the uncontrolled pattern of our rivers and the unplanned river system of the country as a whole. Although a good beginning was made in the direction of flood control through the construction of multi-purpose dams on the major rivers, it is not adequate A lot remains to be done Ours being basically a riverine country with a civilisation along the course of rivers, we have many cities and villages founded on the river banks which suffer most from floods In Delhi the Dhansa Bundh was designed both as a barrier and a controlling channel against the inflow of rain water into the Jamuna river. But this year the rains causing damage to more than 200 villages.

Besides Delhi, several states like Haryana, Rajasthan, Gujarat, Uttar Pradesh, Bihar, West Bengal, Orissa and Assam were affected by the floods of the current season causing great damage.

Grid Scheme

Some time back our engineers had put forward an ambitious project for forming a national water grid by interlinking the various major rivers of the country in order to transfer surplus flow of water from one basin to another not only to harness the flood waters for productive use but also to provide cheap intra-country navigation to carry goods or passengers economically The Central Water and Power Commission recently drew up a proposal of linking up the Brahmaputra, the Ganga, and the Cauvery in the for south connecting en route the basins of Narmada, Tapti, Godavari, Krishna and Pennar The same proposal also comprises other plans for linking up the rivers of the Western Ghats with those of the Eastern Ghats and also for a canal system connecting Chambal in Rajasthan and the Narmada in Gujarat Dr. K L Rao, the then Union Minister for Irrigation and Power took a lot of initiative in this matter This scheme, if accomplished, would not only give a big push to the efforts to modernise the agrarian economy but convert the country into a granary of the world. And as a natural corollary afforestation of large areas would take place which in turn would give a big boost to the economy in all possible ways

Flood Control

The bulk of the average flow of waters in India has been estimated at about 1360 million acre ft. The Brahmaputra and Ganga rivers contribute the bulk of these flows. After the disastrous floods of 1954, the national flood control programme was launched and during the last twentytwo years a large number of flood protection works have been implemented with an outlay of nearly Rs. 445 crore

Important works completed till now comprise mainly storage reservoirs, embankments, diversion works, town protection works, river improvement and anti-erosion and drainage improvement. This has

greatly benefited the people living in an area of 8.5 million hectares; affording permanent protection to cattle and other domestic animals, men and women, dwelling houses, small industries and factories. But in a large country like ours fresh outlays are required to give relief and to foster the growth of rural economy in 20 million hectares of flood affected areas. As the monsoon differs from region to region in the country, flooding of rivers, drainage congestions and bank erosion cause a number of problems, social and economic. These have to be tackled effectively as part of a comprehensive plan. For this, the river system has been divided into four regions: (i) Brahamaputra region (ii) Ganga region (iii) North West region and (iv) Central India and Deccan region.

Several recommendations made by several high level committees set up by the Government are being implemented When completed these measures may save the country permanently from havoc of floods □

Idea of a Teacher

MURIEL WASI

INFLUENCE IS a bad word today. When there is no way to get a good thing done by normally accepted procedure, it helps to approach a friend of a friend of a friend for it So deeply rooted is the general faith in the superior effectiveness of influence over proved ability, that one begins to suspect every new acquaintance who sidles up to one, of contriving to know one for a purpose

The one comfort about all this is that it is not peculiarly Indian It happens all over the world But the expertise that we have acquired in identifying the source of influence and manipulating it would put the rest of the world to shame

A friend who has come round to see me at stated intervals in the last five years has not failed regularly to ask after my health in a concerned way But he has not left without asking for the exercise of what he calls my 'influence' on each occasion.

The fact that his interest in his son's future is natural and that his son has not yet won a scholarship abroad is distressing to both father and son, does nothing jointly to make me more sympathetic to the exercise of the sort of influence that is now assumed to be our normal way of life

And yet what an incredibly valuable thing influence can be ! We celebrate teachers' day once a year to make sure that the teacher *qua* teacher will be remembered But I don't think that a genuine teacher ever runs the smallest risk of being forgotten.

KNOWLEDGE PLUS

Somewhere in *A Passage to India*, Fielding, the principal of government college, Chandrapore, says · "I believe in teaching people to be individuals and to understand other individuals. It's the only thing I do believe in At government college I mix it up with trigonometry and so on"

And this is probably the heart of a genuine teacher's influence He or she teaches trigonometry, algebra, chemistry, philosophy, modern languages, mathematics, anthropology, economics and literature but some part of his work, and perhaps the most enduring part, has little concern with any or all these subjects.

We have reacted strongly in recent years against the teacher's obligation to form 'character' partly because so many amiable incompetents have assumed that even where they do not have a grasp of their subject-fields, they can get by with good teacher-student relations The other superstition that has required to be laid is that if you are ingenious about methodology you can be remembered as a good teacher even where you provide no evidence of scholarship

Between the Scylla of amiable incompetence, and the Charybdis of muddled methodology many honest teachers have decided to stand just for professional expertise 'I teach my field, or a part of it', they say doggedly, and this insistence on knowledge would be upheld by all their serious students.

The ability to communicate is not unknown to flow directly from knowledge of a field and so the notion that methodology is a panacea for poor teaching at college level should have been exploded a long time ago.

Most of us nevertheless concede today that Fielding was generally right. The teacher, the genuine teacher that is, and not what passes for one in many of our schools and colleges, always intends to give his or her students more than a knowledge of the subject-field.

Professional ability is of the first importance, but it is not enough, because professional ability, as a recent film on the Harvard Law School—it was called 'Paperchase'—so vividly demonstrated, can be wholly impersonal. At the end of the course, the law students who have survived its rigours, burst into spontaneous applause that the professor richly deserves because he is professionally outstanding But he knows not one of them as a human being and they are no nearer knowing him The film is a curious commentary on the triumph and failure of teaching over a considerable period of university time

The teacher who will be remembered a million times and not just on September 5, each year is a competent physicist or economist or linguistician or master of literature-- and that is an integral part of his or her influence, for professional expertise is not so common that it can be taken for granted But when all this has been totted up, there will be quite other things for which his influence survives among his students · it will be, perhaps, as it was for G E Moore, the celebrated Cambridge philosopher, that he was so strikingly pure, his integrity was saintlike Or, in quite a different direction, he/she was the person who always knew when there was something dreadfully troublesome in my life that I could not of myself overcome Without seeming to interfere, he/she put things right

ENDURING INFLUENCE

There is a rather sentimental, but still moving novel on a school teacher, called *Good Morning Miss Dove*, that presents such a teacher Here, we have a wholly acceptable portrait of a small town American teacher who knows her society inside out, knows her children, gauges their ability and plans to the extent she can for their future

She remains in the town—Liberty Hill, it is called—and becomes a focal point in it. She is quiet, retiring, unassertive, but deeply characterful and her influence radiates through the town in currents of enduring effectiveness that must bring her great satisfaction

It is not unusual to overhear our students say : when we needed to go down and get jobs to prove our-

selves, to confirm our independence, this and this was the teacher who helped. First, he gave me the right sort of testimonial to get me into the right sort of advanced institution of learning and then he helped to guide me on the job I should go for and then—yes—he helped to prepare me for the job.

And our students add : they did all this because they knew their field and could illuminate their field for us. They taught us how to learn for outselves and so they must have been competent in communication though they carried no diploma in methodology ; but if we remember them today it is for the other things that made their lives part of ours. Their influence invaded us because they knew us and they *Cared For Us.*

And so they continue, though dying or dead, to be with us. The teacher's epitaph should always—but always—be written by his students for they are the best judges of whether the teacher's influence has been transmitted so as to become part of the living. If so, the teacher has had his reward ; he will be remembered

PEOPLE'S PLAN - II

Approaches are Wrong

Dr Harihar Bhakta

PLANNING TRIES to accelerate a continuing development process by utilising existing resources to the maximum and finding new resources. While present resources may be scarce, choices of using them are many. The strategy of planning lies in assigning priorities of investments and efficient mobilisation of resources in the context of the problems facing the economy

The economy is now facing the twin problems of inflation and unemployment Besides, socialism has been accepted as the goal of development. It is on this context, with the advent of the Janata Party government at the centre, that People's Plan II—a developmental perspective plan for twenty years and indicative plan for ten years—prepared by a non-official organisation, namely, the Indian Renaissance Institute, has to be initially analysed People's Plan II is designed with priorities for development of agriculture and small industries, employment-oriented investments and a check on further rise in prices. Besides, investment priorities have been assigned to adequate input infrastructure, supplies of primary consumption goods and improvements in general welfare facilities like health, education and housing

Inflation is a feature of uncontrolled or partially controlled market economy. It results from imbalances in the economy like cash income and expenditure in the development of various sectors of the economy. Sometimes the creation of artificial scarcity of goods is also responsible for inflation. For this, People's Plan II emphasises an increase in the production of consumer goods through development of agriculture and small industries This is not as simple as it may seem.

Not by Investments Alone

For the development of agriculture and small industry allocation of larger resources has been suggested But our experience shows that investments alone do not bring about the desired result. Even benefits of development are not distributed in favour of the weaker sections of society. Therefore, the constraints of development must be looked into. We all know that concentration of ownership of land in a few hands and depriving the tillers of land ownership have been one of the major obstacles in the path of agricultural development. Consolidation of land holdings is said to be an important step conducive for development potentialities In the past, we have failed to solve this problem in spite of our best efforts. This aspect of the problem has been ignored in the plan. Besides, Indian agriculture is still a way of life rather than a business enterprise. Subsistence economy persists. Commodity money production has not emerged fully. This constraint has also not been taken into consideration.

Small industries are labour intensive having a short gestation period Hence, its development will solve the twin problem of unemployment and inflation But government initiative dries up sooner or later. Investments made do not bring fruitful results. Khadi products are surviving only under state protection Products of small industries fail to compete with those of large industries. Therefore, the competitive capacity of small industries will have to be developed through appropriate technology and through protected market. The problem of artificial scarcity of goods can be solved if the state enters the consumer goods on a large scale and strictly control private trading. The public distribution system should cover even remote villages.

In Backward Gear

People's Plan II emphasises labour intensive investments for creating employment opportunities. How has the problem of unemployment arisen? Keynesian diagnosis is deficiency of effective demand. In our economy effective demand is already high It is also said that the use of capital intensive techniques render persons unemployed. But our economy is at a very low level of technology. Agriculture is at a still lower level where the problem of unemployment and underemployment is acute. Thus, unemployment is the result of general backwardness of the economy Its solution lies in lifting the economy. It requires technological development, development of means of production, and productive forces. Corresponding to this socio-economic set-up, relations of production must develop. It requires capitalist development, oriented towards the strengthening of the socialist sector. This will lead to faster development of technology and economy and create more employment opportunities. Labour intensive technique will be a step in backward gear

The framers of People's Plan II, over-shadowed by the problems of unemployment and labour surplus economy, overlooked the constraint arising from scarcity of skilled labourers and managerial and specialised personnel. Sometimes, shortage of skills and experience is serious cause of bottlenecks in the development of the economy. Also manpower balances, that is, requirements and availability, in the economy have not been determined. All this should be done sectorwise, branchwise and also according to trades and qualifications. In the absence of such estimates, solution to the problem of unemployment will be only a far cry.

Socialist Sector Undermined

In the plan the state sector has been increasingly involved only with the provision of services and public utilities and has relatively less to do with industrial growth. Both the state and private sectors have

been given the opportunity to operate, in almost all the sectors like agriculture, industry—large and small and construction Even electricity has not been reserved for state sector exclusively. As regards resource mobilisation during ten year plan period, total tax revenues are over three times more than the total surplus of government enterprises In large industries, private investments are placed higher than government investments. In other sectors private investments are almost at par with the government investments All this shows a trend to undermine the socialist sector.

Thus, it seems that People's Plan II has been prepared on the basis of implicit assumption that economic development takes place in aimless socio-economic vacuum. It has failed to take account of the historical conditions whose importance is all the more in sectors like agriculture and small industries, particularly in the economically backward countries. Socialism as the goal of development has been overlooked The basic causes of inflation and unemployment have not been taken into consideration It does not provide an alternative progressive approach and framework to the Planning Commission document

COAL RESOURCES

Conservation : Why and How ?

A. R. PATEL

INDIA'S energy problem will have to be studied in the context of the 75 per cent of the people living in villages and the availability of commercial and non-commercial sources of energy, more particularly coal The rural population is expected to grow from around 440 million in 1971 to about 800 million by the end of the century Therefore, we shall have to pay attention largely to meeting the growing demand of energy for the rural and agricultural sectors in addition to that required for developing our efficient transport system and industry.

The commercial sources of energy are coal, oil and natural gas, hydro-electric power and nuclear fuels. The non-commercial sources of energy (it is so termed because much of this is not ordinarily bought or sold at any rate in recorded transactions), are the forest sources (which provide considerable volume of firewood and charcoal consumption), vegetable wastes (chiefly consisting of crop-residues) and dried cow dung.

According to the fuel policy committee report (1974) the consumption of commercial and non-commercial energy for the whole of India for the period, 1960-61, 1965-66 and 1970-71 was as under :

Source	1960-61	1965-66	1970-71
Coal in million tonnes	47 1	64 2	71 1
Oil in million tonnes	6 75	9 94	14 95
Electricity in billion Kwh	16 9	30 6	48 7
Firewood in million tonnes	101 04	111 82	122 75
Cowdung in million tonnes	55 38	61 28	67 28
Vegetable wastes in million tonnes	31 08	34 41	37 77

During the year 1975-76, as in the past years, oil generated the highest quantum of energy in India According to official sources, the proportion of energy derived from oil was 30 5 per cent followed by firewood (26 5 per cent). Other sources of energy included coal (21 per cent), hydel and nuclear power (eight per cent) vegetable wastes (eight per cent) and cow dung (six per cent)

Our import bill for oil and petroleum products increased from Rs 194 crore in 1971-72 to Rs 1,245 crore in 1975-76 Crude imports were about 14 m tonnes and petroleum products 2 75 m tonnes in 1975-76 The oil economy plan for 1976-77 provided for an import of about 13 5 m tonnes of crude oil and 2 1 m tonnes of petroleum products, together valued at about Rs 1,300 crore The crude is being imported from Iran, Iraq, Saudi Arabia and the United Arab Emirates The import of petroleum products is mainly from the U S S R Various estimates have placed the demand for oil by the end of the Fifth Plan (1978-79) as ranging from 28 to 30 m tonnes With an annual target of 14 m. tonnes by 1978-79 the country will be able to meet 50 per cent of the oil demand from indigenous production compared to the present 35 per cent.

Along with scientific methods of washing coal, coal gasification and the development of the fluidised bed technology could lead to wider use of the low grade coal An attempt has to be made to leave as little of this valuable commodity in the ground as possible. As part of the energy conservation programme, oil refining technology has to be improved so that it would result in the production of various kinds of petroleum products in such proportions as may be required by the economy

DIVERSIFIED USES

Oil is becoming costly and we cannot afford to continue wasting our foreign exchange on import Coal has been regarded as the primary source of energy in the wake of the rise in crude oil prices Coal is the most important mineral produced in India It accounted for 79 per cent of the total value of all minerals in 1975 With the present production of about 100 m. tonnes India is the sixth largest producer of coal in the world The industry has now been poised for new breakthroughs not only by exploring and exploiting new mines with the latest available equipment but also by finding new users of and uses for coal as in oil extraction and production of fertilisers Coal is also a raw material for synthetic rubber, nyl[illegible] and plastics, insecticides, dyes, tar and refrigerants like carbon-dioxide and ammonia. The coal industry employs a labour force of over six lakhs

The fifth plan target of coal output is 124 m tonnes The estimated demand for coal by various categories of consumers by the end

Sector	1975-76 (Actual)	1978-79 (estimated)
1 Coking coal (steel washery coking plant)	20 08	27 0
2 Blendable coal	0 88	1 70
3 Power	23 04	35 50
4 Railways	14 30	13 50
5 Brick	3 34	1 50
6 Cement	4 44	5 10
7 Fertilisers	—	3 10
8 Export	0 44	2 50
7 Other Industries	18 77	23 00
10 Colliery consumption	3 00	[illegible] 00
Total	88 29	123 90

of the fifth plan is as given in the previous table.

The nationalised coal sector represents a capital investment of over Rs. 650 crore. Over 440 mines are in operation and the industry has an annual turnover of about Rs 600 crore. Since nationalisation, more than Rs. 300 crore has been invested in this industry and by 1978-79 another Rs. 800 to Rs. 1,000 crore is expected to be invested.

As the prime coking coal resources may get exhausted in about 40 years or so and the medium coking coal a little later, efforts will have to be made from now on to conserve coking coal and use it efficiently.

MODERNISATION OF TECHNIQUES

Energy conservation is necessary from another point of view also Large capital is invested in producing energy and capital is scarce Further, our coal resources, though fairly large (85000 m tonnes) are only about 1 5 per cent of the world deposits, while our population is about 17 per cent The long term view, therefore, points to the need of using the coal resources carefully

One of the conservation steps to be taken is modernisation of techniques for coal exploration. The present coal recovery is only 55 per cent Consistent with environmental protection, attempts have to be made to achieve a higher recovery. This is an area which calls for intensive research and development. The larger part of our coal deposits are of low grade with high ash content. Concerted efforts have to be made to develop techniques by which the ash content can be reduced This will also cut down transportation and utilisation costs.

HIGHER THERMAL EFFICIENCY

A significant percentage of the total coal mined would be converted into electrical energy in the years to come. The efficiency of conversion would determine the quantities of coal consumed Modern thermal plants working at high temperatures and pressures have increased thermal efficiency to about 40 per cent. The older plants have a much lower efficiency. In future, we have to use steam parameters which are consistent with higher thermal efficiency as well as the reliability of the boiler itself.

Again, there is a substantial amount of waste heat in the thermal power plants. Wherever possible, attempts should be made to use this waste heat. While there is not much

IGNORAMAN
Wants to know if doing "immoral and improper" actions is the role of the "pace-setter service".

scope in India for using this heat for space heating, it may be possible to use the heat for running cold storages and driers for farm products This also calls for intensive research and development Many industries like paper and sugar have boilers for generating steam for their process needs Often power is generated in these industries as a byeproduct of the production of process steam However, since these boilers work at low pressure and temperatures, their thermal efficiency is not high In future, it would be desirable that such boilers are designed for high pressure and temperatures so that with the same fuel consumption, it would be possible to generate large quantities of power and thereby improve efficiency as well as conserve fuel

The transmission and distribution of electrical energy is accompanied by a certain loss In India, this loss is 20 per cent, which is exceedingly high Attempts to minimise this loss by installing capacitors and improving system conditions are being made. However, the problem of loss connected with rural electrification need to be studied in greater depth and solutions should be sought.

CHOICE OF FUEL

The transport of coal is mainly by rail, though some despatches are by road as well as by sea The net energy transported after taking into account the energy spent in transporting needs to be considered. In some areas the balance may be negligible. An awareness of the cost in terms of energy spent in transportation of energy would be useful in determining the policy and choice of fuel to be used in different parts of the country

An expert group has recommended the establishment of a 'coal-to-oil' project as a precursor to the development of coal-to-hydrocarbon based on chemical technology. The group has suggested Raniganj in West Bengal and Singrauli in Uttar Pradesh as ideal sites for the project. The total capital cost of each plant is estimated at Rs. 701 crore with a foreign exchange component of Rs. 149 80 crore The group has suggested that the project should be taken up in two stages, each corresponding to half the proposed capacity of one million tonnes It will consume about six million tonnes of coal to produce one million tonnes of crude.

ECONOMICS OF SYNTHETIC OIL PLANT

Raniganj has been chosen for the first plant owing to a number of factors favourable to the location, chiefly the fact that the area has adequate proven preserves of coal to sustain a synthetic oil plant and good infra-structural facilities. An analysis of the economic cost calculation of the project reveals that such a plant can stand on its own With an investment of Rs. 635 crore for a million tonne synthetic oil plant, the economic cost of production would be about Rs. 809 per tonne. In this, the economic cost of coal has been assumed at Rs 63 a tonne Against this the economic cost of imported crude based on the prices ruling in January this year was about Rs 909 a tonne. The projected international oil prices for 1982 is $ 144 a tonnes. Assuming a proportionate increase in coal prices, the cost of synthetic crude would be about Rs. 1,400 a tonne India's coal reserves are estimated at over 85,000 million tonnes though these are not evenly distributed. According to the fuel policy committee's recommendations government has decided to regard coal as the prime source of energy. Coal is available to the consumer at one-third the price of the oil. Despite India's recent success in tapping under sea oil and the expectations of self-sufficiency in mid-eighties, coal will remain the principal source of energy for the country of India's size and requirements. Hence the urgency of steps to conserve it and use it prudently. □

Integrated Rural Development

M. PALANISAMI

MANY of our developmental inputs did not yield a return commensurate with the cost and effort involved for want of cooperation and coordination in sufficient measure and for lack of inbuilt feed-back system. Even where cooperation was ensured, it was not effective. Besides, some of the schemes were launched all of a sudden country-wide without their being tried on a pilot basis.

Since more than 70 per cent of India's population is engaged in agriculture and about half of our national income is derived from it, a major plan outlay should deliberately be allotted, in our annual plans, to the development of agriculture and improving the economic conditions of those who are engaged in it. Accordingly, of the total plan outlay for the year 1977-78, 30.4 per cent is earmarked for agriculture and allied services. In spite of a record harvest of 120.8 million tonnes of foodgrain in 1975-76 and a present stock-pile of 21 million tonnes, the prospect for agricultural growth does not seem to be so bright as to generate surplus in future years. Nor is it so bleak as to dismay effort and planning.

STEADY GROWTH IN FARM OUTPUT

For a balanced growth in villages through integrated rural development programmes, agricultural growth rate should be steady. We have more than enough manpower to deploy in agriculture and allied activities. Other inputs like water, power and fertilizer, though available in some measure, are not adequate and, therefore, have to be harnessed or increased. Fertiliser needs are likely to be met but water and power pose problems. We experience floods and droughts alternatively and simultaneously in our country. By scientific management of water, the adaptability of agriculture to these extreme conditions can be enhanced. Hardly one fourth of our nation's water is used for irrigation. The rest has to be harnessed scientifically. Along with it, the available ground water potential is to be exploited to the maximum possible extent to supplement flow-irrigation. It is estimated that not even 50 per cent of the available ground water has been harnessed for irrigation and, as a result, of the total irrigated area, only 30 per cent is covered by ground water. If the national water grids linking major rivers, whose water is drained wastefully into the sea and whose spate creates irretrievable calamities almost every year, materialise, as being thought of now, it would prove to be a boon to agriculture, beat unemployment and boost the economy. By exploiting the ground water potential and providing pumpsets for viable wells, the regions, which are not accessible by rivers or canals, can be assured of irrigation facilities. The fact that about 45 million hectares are under irrigation against a cultivated area of 152 million hectares forecasts the immense responsibility India has to make assured irrigation facilities to the entire cultivated area a possibility

Of the total power consumption in India, the rural share is about one-sixth. More than 2 lakh villages have been electrified against the total of 5.76 lakh villages With the electrification of 81,000 additional villages proposed in the fifth plan, the percentage of village electrification will be increased to 41. More than three million pumpsets have been energized. This figure will cross 3.7 million if the fifth plan target is achieved

POWER NEEDS

Power consumption per unit of land is relatively very low in India The power input in agriculture is 0.4 hp per hectare whereas in Japan it is three to five h.p. and in many of the European countries two to four h.p. Our energy requirement in 1979 is estimated at 1,30,000 mkwh. The installed capacity required to generate this energy will be 33 mkw. There are seasonal variations in power generation owing to the fact that many of the reservoirs where our hydel projects are located have low water levels during summer Load shedding and power-cuts are resorted to and agricultural and industrial production is paralysed. Unless alternative source of energy is found out, there will not be any solution to the shortage of power. Efforts to seek a permanent solution to power problems should not be lost sight of, in view of the likely increase in the number of pumpsets and small rural industries in future.

It is not enough if the basic infrastructure for the development of agriculture as a component of rural development, is alone provided. The farmer for whom our programmes are meant is the pivot of development. Understanding him, his farm, his problems and the varying agroclimatic and social conditions under which he functions for his welfare and the welfare of the society, would help the programme implementers evolve a *modus operandi* by which his participation in the programme can be sought. As there are small and marginal farmers, owner and tenant farmers, and tribal farmers practising shifting cultivation, a suitable development strategy should be evolved for each category to ensure better programme participation. This need was felt in the later sixties by our planners and as a result three agencies, namely, small farmers development agency (SFDA), agency for marginal farmers and agricultural labourers (MFAL) and tribal development agency (TDA) came into being. The objectives of these agencies are more or less same. Briefly they are : to identify the problems of the farmers, prepare appropriate programmes to help them get adequate inputs, services, and credit, find for them supplementary sources of income and evaluate the progress from time to time. At present the coverage of these agencies in terms of population is low. If they are revamped with sound organisation and wider coverage they would definitely accelerate rural development with the full co-operation and participation of their clientele better than the community development and extension services launched in 1952.

RURAL INDUSTRIES

Many rural areas do not have basic infrastructure facilities essential for the growth of small industries The problem of identifying and motivating local entrepreneurs and helping them select suitable product line looms large, as the aptitude to take up a new economic activity and the capacity to bear risks involved in pursuing such activity are relatively low among the culture-oriented and tradition-bound ruralties. Along with it, the difficulties involved in marketing, which the existing units are suffering from, acts as a negative factor in the development of industries and, still worse is the fact that it inhibits even the willing entrepreneurs from taking up industrial ventures Against this background, government has to evolve ways and means to foster industrial growth in areas where the people are totally strangers to that

new activity.

A centrally sponsored scheme—rural industries projects (RIP) was initiated in 1962-63 with the main objective of developing and promoting rural entrepreneurship and identifying potential growth centres, which have the necessary wherewithal for the growth of small industries. In addition to 49 rural industrial projects initially started, 62 new projects were to be included in the fifth plan. These projects have helped more than 24,000 new units to come up and helped about 23,700 existing units to expand further. It is a matter for gratification that more than two lakh people have been given jobs in these new and existing units. RIP covers some selected places in selected districts. After it is ascertained that RIP performs well and strives to achieve its objectives, its coverage can be extended to all the economically backward areas. Once the 'risk-fear' in the minds of the prospective entrepreneurs is reduced, local skill and talent would manifest spontaneously in the form of goods and services.

In all these our steps should be measured so that we do not commit the same mistakes as we did earlier in programme formulation and implementation. Priority should be given to the basic minimum infrastructure needed for further development in the villages. The solution lies not only in the growth of agriculture and industries, in decentralisation of official machinery and delegation of power to the local self-Governments but also in the dispersal of government offices and health and educational institutions to the rural areas This should be done in a phased manner. This would avoid concentration of people in towns and cities, curb migration to town and alleviate urban misery and rural poverty alike □

New Food Policy

Chetan Chaddha

WITH the lifting of all restrictions on the inter-state movement of paddy and rice from October 1, the era of movement controls on foodgrains will come to an end. This decision of the central government, announced as part of the new *kharif* policy, comes as a logical corollary to the similar policy adopted in respect of wheat since April this year. The movement of coarse grains has already been free for quite some time. Barring in 1974-75, when the curbs on wheat movement on private account were lifted, zonal restrictions on the movement of paddy, rice and wheat have been the hallmark of the government's food management policy in recent years. Now, after a long time, the entire country will become a single zone in respect of all foodgrains.

The simple logic of the zonal system was to cordon off surplus and deficit areas to facilitate mopping up of the surpluses and to maximise procurement. Thus each state became a zone and inter-state trade in foodgrains could take place only on a government-to-government basis. There have, however, been at times some adjustments here and there in the demarcation of zones. For instance, a larger rice zone in the south was formed last year which included Tamilnadu, Andhra Pradesh and Karnataka. Similarly, in the north we had a composite wheat zone at one time

All these zonal barriers will now disappear. We do not need them any more because, for the first time, the stocks of foodgrains with public agencies have reached a level where the imperative of maximising procurement no longer exists The highest closing stocks in the past were of the order of 7.88 million tones at the end of 1971. But at the end of 1977, the closing stocks were at the record level of 19.93 million tonnes. Expert studies have shown that the maximum amount of stocks that the country needs to hold to meet the current needs of the public distribution system and to guard against crop failures for two successive years should not be more than 18 million tonnes. Buffer stocking is a costly operation and, as it is, more than 2,000 core of rupees of bank finance is locked up in foodgrains stocks

Buoyancy in Prices

It is, therefore, in the fitness of things that the government has decided to lift all curbs on grain movement and, as a consequence of it, not to fix any specific procurement targets for wheat or rice or other foodgrains. Public agencies would, however, still continue to procure foodgrains to replenish the existing stocks and to provide price support to farmers in the event of the prices in the surplus areas tending to crash. The removal of zonal restrictions and the freedom to the private trade to handle grain distribution from surplus to deficit areas should also provide a measure of buoyancy in prices in surplus areas, while leading to a reduction in the open market prices in deficit areas through larger flows of grains.

Procurement has to continue

With the huge grain stocks in its hands, the government is in a position to meet any manipulations on the part of private traders to create artificial scarcity. At the same time, public procurement agencies are there to prevent any undue depression in grain prices. It is noteworthy in this context that, despite the free hand given to the private trade in wheat distribution in April this year, the total procurement of wheat by public agencies has alredy reached more than five tonnes against 6.5 million tonnes last year It is hoped that rice procurement may also come to three to four million tonnes. This order of procurement through a levy on the millers may be necessary to replace the existing stocks of rice. Last year 3 6 million tonnes of rice was issued through the public distribution system. Even if the demand of the public distribution system somewhat comes down because of the lifting of zonal curbs, the government may have to procure about three million tonnes to maintain the existing level of the rice stocks.

Price Policy

As in the case of wheat, the government has agreed to only a marginal increase in the procurement price of rice. While the wheat price was raised from 105 rupees a quintal to 110 rupees a quintal, the paddy procurement price has been raised from 74 rupees a quintal to 77 rupees a quital, as recommended by the Agricultural Prices Commission. A majority of the state chief Ministers and food ministers who met the union agriculture minister, Shri Surjit Singh Barnala pleaded for a higher paddy price ranging, from 84 to 100 rupees a quintal They also wanted the incentive bonus on procurement to continue But these demands do not fit into the overall objectives of a national policy, which has to take into account the existing stock and storage position as also the general price situation in the country. Even while granting increases in the procurement prices of wheat and rice, the government has decided to maintain the existing issue prices of foodgrains at fair price shops If the procurement prices are raised subs-

tantially, not only will the open market prices tend to rise correspondingly, but it will be difficult to maintain the existing issue prices wihout involving a much higher subsidy and the consequent constraints on the whole economy.

The government has decided not to change the existing procurement prices for coarse grains. But for gram, a major pulses crop, it has made a good gesture by raising the support price from 95 to 125 rupees a quintal. This is intended to induce farmers to grow more of gram by bringing additional area under grain cultivation. In conclusion, one can say that the country has entered a new phase of food self-sufficiency where imports are practically stopped, grain movement is free and the public agencies have a comfortable stock position. A special responsibility now develoves on private traders to maintain this healthy trend by eschewing hoarding and profiteering. Otherwise the government does have the wherewithal to deal with them. □

CURBING POPULATION GROWTH

Just Raising Age of Marriage Will Not Do

M. N. SRINIVAS

SHRI RAJ NARAIN, Union Minister for Health and Family Welfare, recently announced that the Cabinet had aproved of a proposal to raise the minimum age of mariage to 21 years for men and to 18 years for women and that this should be given legal shape soon. This decision should be welcomed as an onus of the government's intention to take up family planning seriously.

As every one is aware the compulsory sterilisation of large numbers of males and females, including sometimes the very old and the very young during the Emergency, produced such a severe backlash particularly in north India that the Janata government had to go slow on family planning for a while.

However, the need to bring down rapidly the rate of population growth is urgent and the relative inactivity on the family planing front during the last several months has only added to the urgency.

It is in this context that the proposal to raise, through legislation, the minimum age of marriage for men and women has to be viewed. It may be added that it is not a new proposal. Indeed, it has been, as they say, on the anvil for the last ten years or so and what the Janata government has done is to give effect to the thinking of the last ten years. This is not said, however, to lessen the significance of the Janata government's decision.

IMPACT ON POPULATION GROWTH

According to the 1971 Census estimate the mean age for marriage for men was 22.4 years while for women it was 17.1.

The corresponding figures for 1961 were 21.6 for men and 15.9 for women But these overall figures conceal significant rural urban differences. Then again according to the 1971 census the mean age for marriage for women was 19.1 in urban areas and 16.5 in rural areas.

The mean age for girls in rural areas is thus 1.5 years less than the minimum age prescribed under the proposed Act. The mean age for marriage for rural girls, namely 16 5 years is higher than the current minimum age as distinguished from that proposed in the new legislation

It is safe to assume that the marriage age will have to be raised by two years or more to reach the legal floor of 18 years. Will the government be able to do it? That is the crucial question. It may be added that the proposed minimum age for men as the current minimum age is very close to, if not a little higher than, that proposed.

It however, the government is able to enforce this measure and that it will not be merely a symbolic gesture like the prevention of Dowry Act, How effective will it be in lowering the rate of population growth ? The period of high fertility among women is from 20 to 29, especially 25—29. But the present legislations is incapable of making a dent in it If the new minimum age comes into force it may be assumed that women at marriage will be in better health. Given better maternal and child care in rural areas, more mothers and infants will survive. This is good. But it will add to the rate of population growth.

Let me now turn to the enforcement aspect of the proposed law. It is notorious that birth statistics in our country are unreliable. Unless steps are taken to have universal compulsory registration of birth especially in villages how can prosecutions be made of violators or rather how can the violators be indentified ?

The registration of marriages is also necessary, as, otherwise, government officials may not come to know of marriages especially among the weaker sections of the population. The possibility that corrupt officials may harass poor and innocent villagers who are ignorant of this law, is not also ruled out.

One would also like to know what the government proposes to do by way of selling the new law to the people.

Presumably mass media will be used. But how will the government be able to convince villagers that it is better for girls to marry at 18 instead of at 15? The villagers might reject the increased age on the ground that it leads to immorality. Has any thought been given to educate rural folk in this matter? Alongside the legislation certain other steps are essential if the rate of population growth has to be brought down

GIVING WOMEN POSITION

The first and the most important of such measure would be to find employment outside the home for all able-bodied rural women or at least for as many as possible Further, if such employment is of a continuous nature, rural women might become career-minded like their urban sisters. And even the husband might start appreciating the contribution they make to the family kitty.

Women should be organised in unions and co-operatives in order to enable them to deal with their menfolk for a position of strength It goes without saying that creche and other facilities must be made available in villages.

Education especially for the rural areas must be linked to employment, particularly self-employment.

With women's employment, more purposive education and better health facilities, the immediate result might actually be to put up the rate of population growth but very soon rural people will begin to appreciate the advantages of having small family.

Yojana Quiz

1. Does a bird always sing the same song ?
2. Why does a snake coil up to sleep ?
3. Do we always wake when we have had as much sleep as we want ?
4. Why does iron feel colder than wood ?
5. Is smell a wave in the air ?
6. Why do motor-cars have numbers ?
7. What is Dead Men's Fingers ?
8. A male brain has an average weight of 49½ oz What is the average weight of the brain of a female ?

ANSWERS

1 It is sure that various kinds of birds have various kinds of songs of their own, but a study of other living creatures shows that individuals differ as we do. It has been noticed that certain kinds of birds change their song as the year advances. The tune is not quite the same in early spring as in summer. 2. Partly to an old primitive instinct that if the animal makes itself small when it is asleep it is less easily noticed and is not so open to attack. Another reason is that there is probably more relaxation of the muscles in the curled up position, so that is more comfortable. 3. The waking is the proper fruit of the sleep. A child could not sleep too long, because directly sleep has done its work the brain must wake ; that is what sleep is for. 4. Our feeling entirely depends on the rate at which the thing takes heat from our fingers. Marble and iron take heat quickly from our fingers, they quickly make our fingers cold, meaning really they make us cold. But wood and cotton do not take heat away nearly so quickly from anything warmer than themselves, and so we feel they are not so cold 5. Smell is not a wave in the air, they are called contact senses. They are due to actual touching of the tongue or part of the nose by particles of certain kinds 6. Motor-cars have numbers on them for purposes of identification. 7. Dead Men's Fingers or Alcyonium digitatum is a common marine animal of the coelenterate order Alcyonacea, sub-class Alcyonarea, class Anthozoa found in deep and shallow waters on European coasts 8 The female brain is about five ounces less than the male brain

Quotation Box

I believe that when democracy is at stake, the utmost firmness should be shown.

Arabs propose but Israel disposes.

—The Economist

BOOKS

Nehru and Growth of Economy in Socialism

Dr V S. Motial

IN THE silver jubilee year of India's independence it has been thought fit to evaluate the growth of Indian economy in socialism and to expound and examine Jawaharlal Nehru's economic ideology and philosophy of democratic socialism, both in retrospect and prospect. Prof. Adarkar, in his foreword to the book "Growth of Indian Economy in Socialism" has remarked : He (Shri Nehru) was a visionary and often his ideas and actions lacked pragmatism and the finesse which is often essential in handling international issues However, there was no doubt that he wanted his country to have the best of everything, a high position in the counsels of the world, a strong and prosperous economy, the best social philosophy which, in his opinion, would ensure a decent life for everyone and especially for the poor and the backward, and a high degree of internal political stability and national unity The people of this country have reason to be proud or him that at a time when the goal of independence was reached, they could have the leadership of a man of the stature of Shri Nehru. There is no doubt that he gave to his country the best of what he was capable of neither sparing any effort nor grudging any inconvenience of suffering".

On the Indian economic thought, Nehru's values and institutional arrangements for the management of national affairs evoked different responses from diffrent segments of the Indian elite. The propagationists of free enterprise felt that his way of planning stifled individual enterprise while, on the other hand, the leftists felt that the management of public undertakings by bureaucrats was against the spirit of socialism His another pillar of nation-building was political democracy in the form of periodic elections and adult franchise, through which he wanted to create consciousness among the people and develop their faith in the democracy. Here again we have one opinion which thinks that we should have a communitarain type of democracy with the place of pride given to the village panchayats On the other hand is the capitalist view that democracy had created greater social conflicts in the country and that sectional demands had assumed significant importance The third view is that of socialists who allege that the democracy became a tool in the hands of the capitalists.

Economic Content to Democracy

Nehru undoubtedly had a great influence on the minds of people of different ideologies and ways because of his deep concern for human suffering The betterment of the people formed the core of his philosophy. He could shoulder the gigantic burden of one of the greatest democracies because of his deep appreciation of mass sufferings His belief in science and technology as powerful instrument in bringing about modernisation of the tradition-bound Indian society was strengthened by his concern for the uplift of the downtrodden. Today when the foundations of democracy seem to be crumbling in many parts of Asia and Africa, India that was built by Nehru stands as an entrenched fortess, unshaken mainly because he tried to give economic content to democracy and freedom Basically believing in the socialistic pattern of society, where the principal means of production were to be under social ownership or control, his approach to the public sector and private sector was pragmatic

In a nutshell it can be said that in his actions Nehru tried to attempt a compromise between extreme totalitarianism and a system ensuring the freedom of the individual to develop his personality in his own way he tried to create the machinery of the state which would assist him in doing so Nehru's thoughts, to a greater extent, have been translated into action through planning, through the concept of mixed economy and its mechanism and through the establishment of socialistic pattern of society

Review of Agriculture

Heavy imports of foodgrains to meet the needs of the country reflect the above mentioned observations In spite of zamindari abolition and restrictions on agricultural holdings, the expected progress could not be achieved because of the lack of finances at the disposal of the most of the agriculturists who have fragmented holdings and form the major constituent of the community The growth of institutional finance has been slow As has been pointed out, "whatsoever finances are available instead of helping the poorer sections and small holdings have so far helped the richer farmers with larger holdings" Moreover, instead of flow of resources from institutional sources helping in removal of disparities particularly in agricultural development among various regions of the country, trends so far indicate that inter-regional differences have been further accentuated Rich and irrigated regions have benefited at the cost of undeveloped, rainfed and dry areas The role of cooperatives, which were expected to play an important role in the development of rural economy and relief in rural indebtedness, has been very dismal Nehru emphasised, "Co-operation is not government control If it is governmental control, good or bad, it is not cooperation whatever else it may be" Contrary to his ideas, cooperatives in India have still to realise the importance of efficient management Most of the cooperatives are managed by the bureaucrats with the result there is more of administration than business

Industrial Situation

Nehru's initial stress on industrialsation paid dividends when industrial production increased at the rate of eight per cent from 1955-56 to 1965-66 and nearly seven per cent from 1968-69 and 1969-70. To protect the interests of workers, the government devoted much time, energy, legislation and budgetary funds towards improving their lot In spite of this, the growth of trade unionism has not set up healthy trends and most of

---

Growth of Indian Economy in Socialism : *edited by Shri Ashok V Bhuleshkar, Published by Oxford and IBM Publishing Company for Jawaharlal Nehru Memorial Institute of Development Studies*

he time, their attempts have been to go on strikes on he slightest pretext without realising the difficult period he nation is going through. It is significant that loss of production through labour unrest has been much greater in the public sector than in the private sector The obvious explanation is that employees of public sector enterprises and services are well aware that they can bring greater pressure on the management of public sector enterprises.

Role of Politician

Even though Nehru guided the destiny of the nation and the country for over sixteen years after independence, he always felt that in a socialist democracy, a politician can have no private life. His life must be an open book above public doubt and suspicion Probably that is why he was respected equally by his friends and opponents and inspired a deep love and affection amongst the masses Viewing his personal political life, one feels that the wealth and income of all politicians from top to bottom should be made open to public gaze and scrutiny Would it not be desirable to disqualify all persons, having wealth and income above a certain prescribed limit, from holding elective and other political offices.

Nehru vs Marx

In his "Introduction", Shri Choksi, while analysing Nehru's thoughts on socialism has aptly said "In Nehru's way of thinking means were as important as ends In the Marxian view the ends justified the means on the premise that if a classless society was established, all exploitations and evil would end, one and for all, thereby sanctifying the use of any means to achieve the desired end It is a measure of the vitality and dynamism of Nehru's thoughts that he never accepted shibboleths, such as those of ultimate utopias, however, high and mighty the source of their origin, intuitively perceiving their static and deadening character History seems to be vindicating the breadth and the vision of Nehru's thoughts"

Portents of Coming Universalism

The Development Progress of Hong Kong and Singapore *by Theodore Geiger and Frances M Geiger, The Macmillion Press Ltd, London,* 1975 ; *Pages XIX*—239 ; *Price Rs.* 10

THE phenomenal economic growth of Hong Kong and Singapore, characterised by the authors as modern city-states, has admittedly evoked worldwide attention and appreciation. They have played very pivotal roles during the first and second development decades in promoting international trade as well as the cultural harmony of the desirable kind amongst the population. However, it has taken the excellent interdisciplinary labour of the two learned authors to portray this story in all too convincing a fashion They have also underlined the specific policies that could be deduced as being applicable to other countries based on the exprience of these two States.

Part I recapitulates the entire story of success and gives the summary, conclusions and backgrounds of the development process from the earliest stages to the latest thresh-old wherein the most valuable pardons deal with the Chinese socio-cultural background that is generally neglected by most among modern economists. This is also a dark area for some of our Indian scholars and hence represents an invitation to a more discursive understanding for bettering mutual relations.

In Part II the emergency of Hong Kong from a centre of entrepot trade to manufactory has received meticulous treatment. In part III Singapore has been given an equally exhaustive analysis. The burden of these two parts is to emphasise on the dynamism of the local Chinese businessmen under free market conditions and the judicious policies followed by the respective governments in fostering the same. The authors have paid high tributes to the dedicated public services rendered by British civil servants, who in their words, "are not docile handmaidens of the Chinese and British community but are least corruptible". Again, "their judgement standards tend to resemble that of high-minded mandarins who sought to achieve the confucianist ideal of disinterested administration and paternalistic concern for the welfare of the society" (p. 146).

The conception of good life of the citizens and the calculated efforts made to distribute the gains of rapid economic growth in both city-States throw up challenges to the newfangled economic policies of several developing countries including those that seek to impose curbs on the operation of multinational corporations. In regard to Singapore's conception of good life the authors are critical and give due consideration of the puritanical paternalism" of the political leaders. There is a lot of food for thought here.

The entire study is weighted in favour of grasping the socio-cultural, albeit particularistic, style of the life and credoes of the Chinese population, its ethnicity and its remarkable resilience in the face of heavy odds. The book, however, is not to be mistaken for an unvarnished adulation of either the qualities of enterprise of the Chinese people or the virtues of the free market economy The identification of the Indian youth in Singapore with the Republic's ideals and aspirations has been happily commented upon with candour by the authors The analysis of the political institutions in their socio-cultural and economic background has great depth and reveals if anything at all, a mastery of details and their interactions

The authors identify the current trends in both city-states as being the gradual if substantial strengthening *of universalistic characteristics* However, they do not deny that it is the particularism of the ethnic groups that had been its strength as well as weakness The entire book is in some respects a forthright plea in favour of a universalistic society (with multinational corporations) that is capable to a significant extent of managing its processes of socio-cultural change over a period of time Short of emerging into this state, Singapore, particularly, stands the chance of facing serious unemployment and halt in its growth of real income. Here then is the quintessence of the wisdom of the National Planning Association (NPA), Washington, D.C. presented by two serious scholars. The only draw-back of their effort is the price of the book which is prohibitively high for readers in India

—B. N Nair

Development Notes

Barauni Refinery Makes Record Profit

The Barauni Refinery, a processing unit of the Indian Oil Corporation, has made a record profit of nearly 26 crore for 1976-77, the first time since it went on stream in 1964. Last year the refinery earned a profit of Rs. 17 crore.

This year's record profit is inspite of a major setback last year when the Refinery had to be closed for nearly 20 days due to unprecedented devastating floods. The Refinery has also paid a sum of nearly 42 lakhs to its employees towards bonus @ 20 per cent for 1976-77.

Exports of Electronic Goods Up

There has been 67 percent increase in the export of electronic goods and the production has risen by Rs. 46 crore. Consumer electronics goods registered the highest growth of 25 per cent during the year followed by professional electronics goods at 10 per cent. Radio and TV sets account for about 80 percent of the production in the consumer electronics area. Production of TV sets rose from 96,800 to 1,43,500 in 1976 and of radio receivers from 26 2 lakh in 1975 to 29 8 lakh in 1976.

Irrigation Schemes for Tribal Areas

Rs. 17.62 crore would be spent on four medium and 395 small irrigation schemes in Bilaspur and Raigarh districts of Madhya Pradesh this year. The schemes include 47 small works in the tribal areas of Bilaspur district under the tribal sub- plan and 64 small works in the tribal areas of Raigarh district under the same plan.

Completion of the above schemes will mean the extension of irrigated area in the two districts by 86,000 hectares.

Exchange Earnings from Tourism

India achived 14 8 per cent growth in tourist arrivals in 1976, in spite of continued general setback in long haul traffic in the world. According to the 1976-77 annual report of the Ministry of Tourism and Civil Aviation tourist arrivals crossed the half million mark in 1976 with 5.33 lakh tourists (excluding nationals of Pakistan and Bangladesh) visiting India compared to 4 65 lakh tourists in 1975. There was a large increase in tourist traffic from West Asian and Gulf countries

Rubber Reclamation Factory for Ratlam

A Rs. 81 lakh medium size rubber reclamation factory sanctioned by the Central Government will be opened in the private sector at Ratlam in Madhya Pradesh.

The industry with a production capacity of 2640 tonnes will manufacture moulding powder out of old rubber pieces. The factory will start production in a year's time and offer employment to over 100 persons.

Micro Milk Chiller Developed

A Micro Chiller which is ideal for preserving smaller quantities of milk collected in remote milk collection centres has been developed by Larsen and Toubro. The micro chillers offer the advantage of bulk coolers and instant chillers at a lower price. These 500-litre units are ideal for villages where the milk available for marketing does not justify larger investment in conventional milk-cooling equipment.

This Micro Chiller has been developed in India for the first time. The chilleder consists of a refrigeration unit which produces chilled water for cooling of milk. Integrated channels in the milk tank walls, through which chilled water is circulated, ensure rapid cooling of milk. The unit cools the entire quantity of milk simultaneously at a fast rate. The cooling cum—storing tank is made from a special aluminium alloy. An exclusive feature of this tank is its design which makes it an efficient heat exchanger. It enables milk to be preserved for 24 hours without spoiling.

World Bank Aid for Irrigation Projects

A World Bank loan of Rs. 52 crore approximately has been negotiated for over a dozen medium irrigation projects in Orissa involving an innovation in the traditional lending procedures of the Bank. Instead of the Bank's assistance being tied to specific projects, the Orissa irrigation credit which will be from the IDA, will be used for as many of the projects as listed by the State government. These projects have been selected on the basis of their fulfilment of the technical and economic criteria laid down by the World Bank, including a 12 per cent return on investment

Punjab Plan to Line all Water Courses

A programme for lining 4,000 km of water courses would be accomplished in Punjab by the end of this year as against 1,400 km water courses lined during the past 30 years The project is estimated to cost Rs. 19 crore. It is also proposed to undertake lining of all water courses in the state–50,000 km—in five years. Punjab would thus be the first State in the country to achieve cent per cent lining of water courses.

Master Plan for Tourism

A Rs. 12.75 crore master plan prepared for promoting tourism in Madhya Pradesh is to provide facilities to middle income tourists, who form the bulk of traffic, both domestic and foreign.

The plan envisages development of tourist facilities at places of historical and archaeological interest, wild life interests, holiday resorts and pilgrim centres and wayside amenities. The plan also provides for increasing transport facilities, organisation of festivals, fetes, exhibitions, cultural programmes, encouragement to local talents and creation of permanent recreation centres. The State attracts approximately 25 lakh tourists every year.

The Democratic Temper and Temper of Peace

We as a nation have been conditioned in a democratic and peaceful manner. This conditioning is opposed to the type of conditioning which a country like China has had, especially in the last dozen years or so. Even previously for 30 years, China has been in a sense at war, and it has constantly put forward the idea of war. We have, on the other hand, constantly spoken about peace and we are, in spite of using excited language sometimes, a peaceful people and we have pleaded for peace in our own country and all over the world. Naturally that conditioning is different from the conditioning which China has had Having so conditioned their people, the Chinese Government can turn the people's thinking in any direction they choose.

Democratic countries cannot normally behave like this In India we have to face the new situation against a background of democratic freedoms. To some extent, these freedoms have to be limited. There is the Defence of India Ordinance which is not functioning wholly as it is meant to **We do not like to enforce even the Defence of India Ordinance unless we are forced to do it. At the moment we are inhibited in acting even in regard to stopping a man from writing or publishing something.** But in China there is a completely regimented apparatus controlling private life and public life. That may be helpful in a war effort, but I do not think it is helpful ultimately

I do think that a democratic background is ultimately the stronger of the two. You have had a glimpse of such strength even in the last two or three weeks in India in the wonderful response which we have had from our people That is not a regimented response. That is a spontaneous response which has come out of the people's minds and hearts It does show that our fifteen-year-old democracy has taken roots in the people They may quarrel with each other and make all kinds of demands, but when they see that there is a danger to their democratic set-up, they respond in the manner in which they have done That is a very healthy sign. That is a very hopeful sign which has heartened all of us.

So I do think that the democratic apparatus is ultimately good even from the point of view of war, provided the apparatus and everything else is not swept away at the first rush We can be sure that it will not be swept away Therefore, it becomes a question of utilising people's enthusiasm in a democratic manner with such limitations as war impose upon us and directing it to defend the country. We have to think from a long-term view. It should not be a case of losing our breath too soon We may have to run long, long distances, and we have to carry on with determination and with fortitude for a long, long time

Essentially, the parliamentary form of democracy is based on laws and conventions Even more than the law of the Constitution, it is based on conventions, and the behaviour of the people who participate in its working . . .

To my mind, the freedom of the press is not just a slogan from the larger point of view but is an essential attribute of the democratic process. I have no doubt that even if the government dislikes the liberties taken by the press and considers them dangerous It is wrong to interfere with the freedom of the press. By imposing restriction, you do not change anything, you merely suppress the public manifestation of certain things, thereby causing the idea and thought underlying them to spread further. Therefore, I would rather have a completely free press with all the dangers involved in the wrong use of that freedom than a suppressed or regulated press . .

If information—including conflicting views and sometimes even contradictory views—comes from every quarter, we are more likely to arrive at the truth out of that welter than if only one aspect of it was presented. The whole concept of freedom of information rests on this idea. I entirely agree that sources of information should be as free and as varied as possible.

. We live in a changing world and a changing world brings changing problems I am convinced that the more freedom there is the better Suppression, even of what I may consider wrong, is bad I am prepared to take the risk of allowing truth and the so-called right and the so-called wrong to appear on the scene . Toleration of an opinion, even though you disagree with it, is a sign of culture and civilisation But before you tolerate something, you must know what it is Therefore, I consider that the principle of freedom of information through the press, the radio and other mass media is very important

Strength does not lie in strong language and shouting, but in other matters It is perfectly true that we want peaceful settlements of our troubles with China and Pakistan, and we shall endeavour to realise them, however, difficult they may seem today. Taking a long distance view it is essential that we should exist peacefully with these two neighbours of ours, more particularly with Pakistan. We cannot live in conflict for a long time. I hope a time may come when India and Pakistan might draw closer to each other; there is no other way

"The desire of a ruling nation to maintain the *status quo,*" says Trotsky, "frequently dresses up as a superiority to 'nationalism', just as the desire of a victorious nation to hang on to its booty easily takes the form of pacifism. Thus MacDonald, in face of Gandhi, feels as though he were an internationalist".

I do not know what India will be like or what she will do when she is politically free. But I do know that those of her people who stand for national independence today stand also for the widest internationalism . . .

Politicians and statesmen strive for peace through the technique of politics which consists in devising carefully worded formulae .But somethingfi more is necessary than mere formulae . What we need is a passion for peace and for civilised behaviour in international affairs. It is the temper of peace and not the temper of war that we want.

On Gandhi

This little man has been and is a colossus before whom others, big in their own way and in their own space and time, are small of stature. In this world of hatred and utter-most violence and the atom bomb, this man of peace and goodwill stands out, a contrast and a challenge. In an acquisitive society, madly searching for new gadgets and new luxuries, he takes to his loincloth and his mud hut. In man's race for wealth and authority and power, he seems to be a nonstarter, looking the other way, and yet what authority looks out of his gentle but hard eyes, what power seems to fill his slight and emaciated frame, and shows out to others! Wherein does his strength lie, wherein this power and authority? . . .

Often we do not understand him, we argue with him and get angry sometimes. But the anger passes leaving us rather ashamed of our lack of balance and restraint Only that pervasive influence remains and he seems to become the vehicle and embodiment of some greater force of which even he is perhaps only dimly conscious Is that the spirit of India, the accumulated experience of the millenia that lie behind our race, the memory of a thousand tortured lives?

I have sometimes found it difficult to understand Gandhiji's approach because my mind functions differently While fully appreciating the political aspects of non-violence in our struggle, I have been unable to appreciate many of its implications Gandhiji, though he lays emphasis on certain ethical and other aspects, does not ignore political aspects, as every one knows It is perhaps a question of emphasis for him. He has developed a certain technique of action which has yielded great results to our movement for freedom

In many matters I have ventured to disagree with him and probably I may continue to disagree with him But at the present moment I have no doubt that we must give full and loyal cooperation to him, so that he may have full opportunity of developing the movement

This does not mean my accepting all the implications of everything that Gandhiji may put forward, but I do propose to function as a disciplined soldier as long as I can

Gandhi, laying stress on India's past treasures of the mind and spirit, told us not to close our doors and windows to the winds that blew in from the four quarters of the world, but he warned us not to be uprooted or blown away by these winds . . . Gandhi was the man of action, the true revolutionary, single-minded in his aim and going as the arrow from the bow . . . Gandhi did not talk or perhaps read much of poetry or art and yet his life .. was a poem in action, and he wanted to put himself in harmony not only with nature, but with the lowest in nature. And so Gandhi crept into the hearts of those who were disinherited and whose life was one long tale of unhappiness

He taught us the love of truth and straight dealing not only in our individual lives but also in public affairs and in the intercourse of nations He taught us the dignity of man and of man's labour. He repeated the old lesson that, out of hatred and violence nothing but hatred and violence and destruction can result And so he taught us the way of fearlessness, of unity, of tolerance and of peace

How far have we lived up to this teaching? Not very far, I fear.

New Approaches to Economic Policy

Statute Change : Great Act of Renunciation

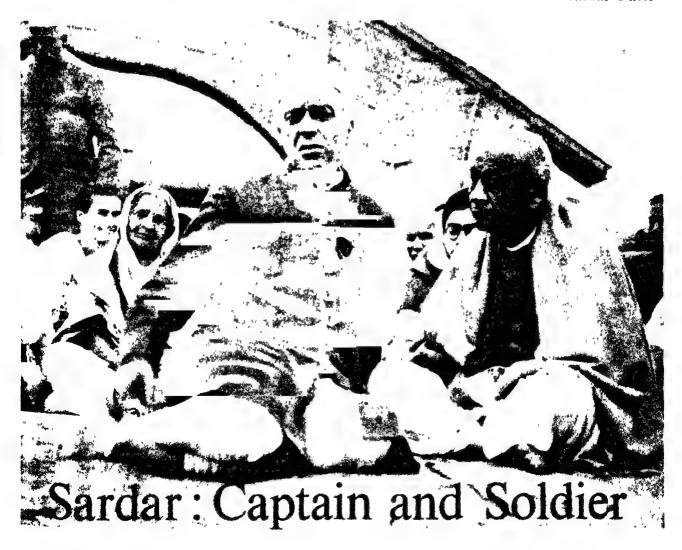
PM for New Communication Policy

Onward to Rolling Plan

Let the Officer bow Before the Peasant

The peasant does not belong to the third world or the last estate but to the first estate. The rest are parasites. He is the food giver. If he was idle, the whole world would starve. His is also comparatively the purest life in the world. Character always depends on whether a man works for his own bread or works others for his bread, and the peasant is the least dependent among all mankind. I resent the description of the peasant as a poor, wretched creature No, if any one has the right to walk with his head erect on earth, it is the peasant. Why should he bow his knee before any one, be he a zamindar, or an officer of the government ? Let them bow to him without whom all of them must starve.

Sardar Patel

Sardar : Captain and Soldier


The Whole of India is my Village

I do not believe in any caste or community. The whole of India is my village and men of all communities are my friends and relations. I have come today in the hope of making you see this ocean of humanity. There should be no need to speak of our virtues. They speak for themselves. But our faults far exceed our virtues Do we grudge our neighbour his prosperity ? When we see him well off, do we feel happy or do we feel envious ? When our cousins or even our real brothers grow prosperous, we do not feel happy. Whether you belong to a 'high' or a 'low' family has nothing to do with your qualities. A man with character, a man who practises virtue is definitely superior to one who claims to belong to the best families. Forget all distinctions such as 'high' families and 'low' families. Today the most ancient of kingdoms are being destroyed. All people belonging to the various castes and communities are the children of the same God. After a man dies, does anyone ask, is the corpse that of a brahmin or of a chamar ?.. ... To what do you attach the meaning of high or low and what is the death of which you are afraid ? Whoever is born is to die one day Why then should one die as a coward and not as a man ? To live or to die is in the hands of God. To what purpose, then, should we be greedy ? Why should we be jealous of our neighbours ? Why, in short, should we do anything wrong or evil ?

Sardar Patel

(from speech in his home village in Karamsad)

It is no use having palatial building worthy of the capital city if, along with them, you have unsightly and insanitary structures which disfigure the whole city. I should much prefer that we go to another place where we can live in more compact, less ostentatious but cleaner and simpler buildings.

From Sardar Patel's Letter to Shri Mohanlal Saxena, Minister for Relief and Rehabilitation, October 23, 1949.

There is no school equal to a decent home and no teacher equal to honest, virtuous parents. Modern high education is a deadweight on the villagers. Their children will never be able to get it, and thank God, they will never miss it if they have the training of the decent home.

—Mahatma Gandhi

What are we Planning for ?

THE REPORT of the Capoor Commission on the Rewasa episode and the revelations made before the Shah Commission about harassment, illegal arrest, insensitivity in high places, unimaginable sadism and worse are significant on more than one count. The erosion of ethical sense started long before the infamous emergency was proclaimed. The horrendous events of Rewasa and nearby Bhiwani took place in March-April, 1974. In these and the later events, the highest in the political hierarchy had a share. The top civil bureaucracy was prepared to participate in the most fantastic oppression and cruelty. Some policemen, far from acting as the guardians of the law, were almost eager, it would seem, to violate even its rudimentary norms.

Even if some of the members of the central cabinet can plead innocence, ignorance and helplessness in the emergency setting, no such plea is possible or available in the case of the events of 1974. Among the redeeming features of the Rewasa horror was the courage of a woman minister of Haryana and some lawyers of the State. Promptly they were dealt with in accordance with the prevailing norms of public ethics, public life and public administration. Did the other colleagues of Mrs Chandravati raise their voice against the indecency of what happened in that hapless village ? Did other lawyers launch a movement of boycott ? What was the famed pace-setter service doing beyond asking for special pays, selection grades, deputation posts and foreign assignments ? Where was the conscience of the police service ? What about other functionaries ?

And can members of the central cabinet, members of parliament, the press and the professions say with any degree of honesty that they did everything to rouse the nation's conscience ? On the other hand, the repeated importunities of the harassed people did not even get so much as a hearing. The women went from minister to minister, from official to official but these high dignitaries had other things to do than listen to the woes and work for the redress.

Places of worship were demolished with impunity. An old woman was burnt to death Brother and sister were subjected to indignities beyond description. And this was not during the emergency either.

If a whole people were silenced by this orgy of terror, what is even more tragic that the gruesome revelations do not appear even now to have stirred the nation to righteous indignation. Business goes on as usual.

We may plan for plenty, for dams big and small, for industries, giant and tiny, for schools, for roads, for water and what have you. The planning commission may do exercise in projections, perspectives, financial outlays, resource mobilisation, physical targets and defence preparedness. If a quarter century of planning has only led to conditions of mediaeval terror, destitution of the spirit, the erosion of the ethical will, the emasculation of the people and the arrogance of the rulers, the planners have much to answer for. So, of course, have our political leaders, the civil servants, the journalists, the lawyers and the rest.

Judging from speeches and statements of leaders of government and members of planning commission, a great exercise is now on about a radical new approach to planning. Will these wise men take some time off and ask themselves what they are planning for ? The least that the planning commission can

individual greed, but helps in the process of a great nation and a noble people regaining the strength to withstand even the worst despotism, private or public, and defend their honour and self-respect as well as the honour and self-respect of their fellow-men.

us, by all means, plan for bread. But let us also p for the basic quality of a human being. All our pl so far have only made slaves of a free people beasts of men.

Towards a Janata Party Economic Policy

AT THE time of writing this, the executive of the Janata Party is engaged in the arduous exercise of giving meaning and content to its election promises in the economic area. On the broad political front, the party has acted with assurance and speed. Not only are the liberties and independence of democratic institutions being restored at a breathtaking rate, but the prime minister and the home minister have gone to the heart of the matter by recognising and even pleading for the adversary role of the media including the government media and by advising policemen, administrators and statutory bodies to resist unethical political (including ministerial) highhandedness and illegal orders The police commission will be headed by an administrator and its terms of reference will be fundamental. The enquiries into the emergency infamy have vindicated the government's decision to order them.

The main criticism of the party has been the tardiness in economic policy formation. Even here, the critics have recognised the immensity of the task of correcting the mismanagement of the economy in the immediate and, in some ways, the not so immediate past. Public sector expansion has not been so planned as to yield the necessary surpluses while consuming a large chunk of investment resources—thus leading to stresses of different kinds Industrial production, in a circumstance of subsidised consumption, protected market and dependence on governmental largesse, has led to problems of viability, without significantly adding to employment capacity A viable agricultural sector has received less than due attention and is starved of capital. Licensing and controls in the name of socialism have led to monopolies and widespread corruption. Inflation in the absence of growth and in the context of growing unemployment as well as deepening poverty has been a continuing feature of the kind of planning this country has witnessed so far.

The problems are real and no serious critic is suggesting that solutions are round the corner The main criticism is that even in areas where decisions are possible, the government has been slow in acting, as for instance, in the wages and incomes area What is refreshing, however, is the growing convergence of views among the diverse Janata leadership on the basic approaches. This is reflected in the panel report suggesting a forty per cent allocation to agriculture, restriction on flow of private foreign capital, more efficient running of the public sector, decentralised industry, speedy land reforms with a lower limit of 2 5 acres, strengthening the public distribution system, organisation of service cooperatives both for rural industry and for agriculture, creation of new avenues of rural employment, enlargement of the internal market, ban on new industry in or around metropolitan areas and reversal of monopolistic trends.

ALMOST SIMULTANEOUSLY Shri Charan Singh's book embodying broadly his views on economics has come out. The home minister has com be recognised as a person who has devoted consi able thought to a radical new direction to econo policy. The problem has been posed by him as between freedom without equality and equality with freedom. The middle path between capitalist democr and democratic centralism of the communists would cording to him, seem to lie in narrowing income dif entials with maximum freedom to the citizen in " choice and operation of his economic life". The sta intervention is as bad as capitalist exploitation. T the small man—shades of Schumacher and the shac of the Mahatma—becomes crucial in Shri Cha Singh's scheme There is no other way of bring about maximum egalitarianism consistent with ma mum freedom, ending unemployment, dismant monopolies—whose assets according to the home m ister, have grown from Rs 2,335 crore to Rs 5, crore in a decade—and securing democracy aga authoritarianism. In going about this business, would caution against ignoring the "endowment fact which he has clarified to mean the maximising of yields from land, labour or capital recognising limiting factors in each case

By and large, the Janata Party's panel report is accord with Shri Charan Singh's emphasis on "sr independent peasant farms, interlinked by service operatives" and on cottage and small-scale enterpr again to be served by cooperatives In this sche if the monopolies have no place the state has li place even in the distribution process ; for product and distribution, as prescribed by Gandhiji, would near simultaneous. Self-employment has a big pl in the home minister's strategy

Shri Charan Singh's other ideas on the nexus l ween politician and businessman and on multinatio have been endorsed by Shri Vijay Kumar Malhotr a paper for the meeting of the Janata party execut He has drawn attention to the party manifesto cautioned against dilution of the idealism of that ma festo He has laid stress on personnel and pri policies so as to rid the public sector of bureauc ineptitude

THE JANATA party's election promises incl an economic charter which sets a ten year de line to eliminate destitution, lays down a policy narrowing the income differences between the to and the villages, enjoins a gradual reduction in inco disparities towards a goal of one to ten ratio ir decade, and calls for the "right to work" of all citize

Now, criticisms are certain to abound. These be of more than one kind. The newspaper writ will reflect the veiled attempt on the big business scuttle policy in its self-interest or the naivette of urban liberal whose capacity to think beyond set f mulations has not been much in evidence. There also a category of informed and genuine critic committed to a basic ideology without be

imprisoned by contrived jargons. One such published criticism has been that the Janata party panel has not sought to reduce public sector investments and eliminate fresh investments in the unviable industrial sector in order to find the increased resources for agriculture, the panel is silent on the subsidy question while its reference to the distribution system may imply greatly increased subsidies with possibilities of further inflation. The assumption that agriculture cannot absorb more men is also sought to be disproved by citing the Japanese example where the farm productivity rate of five times the Indian average has been achieved through modern methods and yet agriculture has absorbed much more than double the number of people so absorbed in India per unit of cultivated land

The example of Punjab has also been invoked. Intensive agriculture even with technology has great scope for labour absorption. If this is accepted there would be no need to reduce the level of technology elsewhere, cloth for instance. **Finally the legal and administrative compulsions of any new radical policy do not seem to have been fully appreciated. There is need to dismantle much of the administrative apparatus, with a frightening consumption and wasting capacity.**

WITH ALL this, the Janata party may still be able to win appreciation for not fearing the new. While the party may continue to listen, read and learn, it need not be afraid of making mistakes, even big mistakes, so long as they are not silly ones. And, whatever the policy, the time is now for implementation. The planning commission, while providing the expertise, cannot but function within the political and economic policy of the party in power in our scheme of parliamentary democracy. If this is to be ensured, the party has a simultaneous obligation of mobilising public involvement in the planning process.

Onward to the First Rolling Plan

A POINT which is likely to be missed in the guidelines issued by the planning commission to the state and central authorities is the emphasis on the delivery of basic amenities and services in villages like drinking water, health care, elementary education and non-formal adult education Add to this an appropriate communication policy and outlay as well as pre-emption of funds for investment in irrigation and you have as radical an approach as anyone would like to have. Dr. Raj Krishna has also said that seventy districts with an employment rate of ten per cent have been identified for block level planning. Some doubts have been expressed about performance evaluation of the work of the block agency These are genuine doubts even as the difficulties are real. They can be overcome only if new organisational patterns outside the present administrative system are worked. It is because of the neglect of this important detail that the previous initiatives in area planning have been defeated.

The argument that, since the commitments for long gestation projects are not variable and the new emphasis on rural development will limit the options, manoeuvrability under the rolling plan idea will be severely limited is not very convincing The accent is on time-bound targets for the removal of unemployment, elimination of destitution, and reduction of income and wealth disparities. Further, the size of the plan will correspond to real savings, there is, therefore, scope not only for worthwhile annual assessment and reassessment but even for a continuous watch over movements in several directions Earlier it was assumed that a desired growth rate is not a function of different aspects of policy including realistic resource mobilisation. Realism is neither a substitute for nor an argument against innovation The climate for such innovation is very favourable with the food and foreign exchange situation continuing to be bright The scope for innovation can never be said to be exhausted, it is not so, in any event, now, not only because of some fortuitous economic factors but more importantly, because of a new mood in the country.

The view that the planning commission believes in no more than continuity and consolidation is not only uninformed but a little uncharitable and, if one may say so, malicious. The weakened resource base has obviously been taken into account judging from Dr. Raj Krishna's observations For some thirty to forty per cent increase in the outlays for the coming plan, compared to the one which is to be terminated in March next year, the commission is confident of raising resources through market borrowings and additional taxation It is strange that the very critics who have been arguing that several sources of taxation have not been tapped should continue to talk of narrow resource base.

DR. RAJ KRISHNA has clarified that while the tempo of public sector investment will be maintained and even increased, the direction will change in favour of rural infrastructure, public distribution, basic industries to serve agriculture and small units and supporting infrastructures to meet the financial and commercial requirements of farmers and rural artisans. All this will provide a strategy of growth "that will spread the employment pattern faster" than before Dr Raj Krishna has said that the planning commission is working for the allocation of resources to small as well as large units in the eight reserved industries—grain milling, sugar, vegetable oils, textiles, wood processing, leather, light metal fabrication and ceramics. The most appropriate technologies to maximise capacity utilisation (of facilities and manpower) will be located Public distribution schemes would include fair price shops at every public works site

The employment strategy would aim at sustained increase of labour absorption in irrigation and agriculture including processing, storage, transport and distribution. The service sector will be another area of fruitful employment, besides, of course, cottage and small scale industries and self-employment.

The planning commission has stressed the need of coordinated (as different from compartmentalised) economic policies linked to priorities

BESIDES TARGET orientation and accent on the social aspects of development, the caution against enthusiastic targeting, without the backing of resources, is a salutary aspect of the planning commission's guidelines The states have been asked not to neglect existing health, education and farm support services to be financed from the non-plan budget Assets already created must be maintained well and utilised equally well. Irrigation and power

projects at an advanced stage of building should be completed and commissioned quickly. The minimum needs programme should be linked to the felt requirements of target groups, that is, requirements like house sites, rural water and electricity, market roads and health care.

Though the time table for the NDC discussion and launching of the new plan is rather tight, the commission will do well not to give the impression being in undue haste. A somewhat enlarged pa cipation of the professional and the not so pro sional sections of the people in the discussion of w is, in essence, a national task would help cla many issues. The least important in such discuss is the entrenched bureaucracy, particularly the fin cial bureaucracy.

Statute Change: Act of Renunciation

IN THE discussion on the changes in the Constitution in the context of undoing the mischief of the 42nd amendment, what has perhaps not received due attention is the unique gesture of renunciation shown by the government. It is all very well for Shri Masani to quote from the Janata Party manifesto and to draw attention to the original sin of the 42nd amendment in the manner of its being bulldozed through Parliament with the opposition in jail, the press muzzled and the people emasculated. It may also be good to say that the opposition majority in the Rajya Sabha cannot acquire the status of a veto, and should, in fact, be shown up for what it is before the general public. In the bargain, Shri Masani has hinted at some possible vested interest. He has also quoted JP's words about parliamentary supremacy calling it "something sordid, something revolting to a democrat". There can be no dispute about the argument that no organ of the state is or should be supreme and that the President must also have some role in the constitutional set-up

But, why does Shri Masani ignore that a constitutional amendment is not a ritual to be attempted without regard to a certain prevailing compulsion ? And why does he not recognise that, besides giving up most or all the powers conferred by the 42nd amendment, Shri Desai has even gone out of the way in proposing to subject any proclamation of President's rule in states to judicial review ? Shri Namboodripad also will be better able to sell his ideas if he handsomely recognises the degree of renunciation of powers in favour not only of liberty but also of federalism involved in the government's proposals The rigors of preventive detention are proposed to be almost altogether eliminated through a constitutional injunction The fine balance between the people and parliament, parliament and the judiciary, the judiciary and the executive, the states and the centre, the citizen and the government, will be restored The gross iniquity of the state having all the rights and the citizen having all the duties will be removed The President can refer back to the cabinet, at least once, any advice tendered by it The courts will be enabled to call for rules of government business The term of the Lok Sabha and the assemblies (where the Janata party has comfortable majorities) is to be reduced to five years. The privileges, powers and immunities of legislatures are to be codified. The special majority needed in some cases for a Supreme Court verdict is sought to be annulled It is proposed to give back to the states education and forests. And finally, the central powers of unilateral decision on the dispatch of forces to the states, of arbitrary declaration of emergency and equally arbitrary amendment of the Constitution are proposed to be given up.

WHATEVER THE criticism, one cannot but recognise that such renunciation of powers is unique, without parallel and exemplary. Shri D and his colleagues will need all the goodwill and s port to carry their intentions through. Once thi done, we will be able to take off from there for r destinations of democracy, freedom, people's sov eignty, that is, *lok shakti*.

An Idea Dimension to Planning

MAHATMA GANDHI was once asked a spec question: "If distribution could be equalis would not mass production be sterilised of its evils He replied, "No; the evil is inherent in the syste Distribution can be equalised when production is lo lised; in other words, when distribution is simultane with production."

Gandhiji recognised the limits of such localisation production. The trouble, very often, is that absol vitrue is made of the ideas of men like Gandhiji was largerly talking of approximations, as is clear fr his writings.

Take for instance cement. This is recognised a basic development input The mini cement plant te nology evolved by the Cement Research Institute, t great extent, answers to Gandhiji's description T Director of the Institute, Dr H C. Visveswaray has relevantly drawn attention to this aspect He said that this new technology will avoid wasteful mo ment of materials and localise the utilisation point

There are dedicated civil servants and social work in this country who have sought to relate their id to the social consequence of development. Only t are far away from Yojana Bhavan It is time planners reckoned with these men of ideas, humil endeavour and social responsibility and went bey the insular and in-breeding bureaucracy of the co mission rooms.

Dr. Visveswarayya has also referred to other adva ages of the mini cement plant technology based vertical shaft kiln compatible with Indian paramet This will greatly reduce packing charges, enable development of the industry in terrains where mo ment of machinery and cement is difficult, make p sible the use of small deposits of limestone scatte all over the country, bring down the unit cost of cem transportation and thus reduce the strain on the nati transportation infrastructure.

The other advantages are equally obvious. Emp ment in villages can be created on a dispersed b The mini plant technology will contribute to the de lopment of local economies, bring the cement indu within the financial access of the small entrepren invest a sense of ownership in men with relati smaller means, reduce per unit capital investment (c trary to the prevailing notions of economies of sca

a myth exploded by the examples given by Schumacher) and help realise quicker return on capital because of the low gestation period.

WHAT HAS been achieved by the Cement Research Institute is nothing less than a revolutionary breakthrough. A complete analysis of a small cement plant was carried out. Each dissected component was technically evaluated. The critical areas of design features and operational snags were pinpointed. Design alternatives were tested; and, finally, the most suitable solutions were found. The characteristics of raw material and fuel to be used, the process system engineering and detailed designs of components were studied in depth.

The present cement manufacturing capacity in the country is around 20 million tonnes, and there is 90 per cent utilisation. Increases in production have necessarily to be through new units Large plants are both costly and long in coming. The various assistance schemes put forward by the industry will raise some social questions. Machinery replacement and rehabilitation will also be posing problems.

The Cement Research Institute has also done work on the use of fly ash from thermal power stations in areas were limestone is scarce. Use of steel plant sludge in the place of limestone is also being investigated. Steel plants can, in the bargain, make some money and solve the problem of waste disposal

The Industry Minister is all for the mini plant, and industry cannot be averse to it Even with intensive use of manpower, the cost of a mini plant is unlikely to be more than four or five crore rupees. One presumes the planning commission will help set up a very large number of such plants, particularly in the villages.

THERE IS also news from the Bhabha Atomic Research Centre Dr. V K Iya of the isotope group has held out hope of a new method of recycling sewage using isotope radiation technology for the treatment of sewage sludge with gamma radiation obtained from the cobalt-60 source. Besides making available organic fertiliser, this will improve public health standards. Gamma radiation cleanses air and water of micro organisms (present in sewage) which often lodge in human bodies as parasites through the contamination of drinking water or through atmosphere. Isotope radiation has other uses, for instance, assessment of water reserves, extent of depletion and rate of recharge, which can help solve drinking water and irrigation problems Ground-water hydrology is useful in determining the flow rate of river waters, which can help resolve inter state river disputes. Isotopes can be used to study the effluent discharge pattern and control water pollution.

BARC has already developed labelled fertilisers, which, when applied to particular soils, monitor data on the right quantity and type of fertilisers for various floral species. Only two other countries have produced labelled fertilisers.

THE CENTRAL Building Research Institute has developed a prototype domestic solar heater which is now being manufactured under licence from NRDC The storage tank can maintain the heat for almost two days. The unit can be installed anywhere.

Several other projects to use solar energy have been identified. Priority projects include water pumps, crop driers, distillation and desalination equipment for clean drinking water and development of solar thermal energy hardware and systems, including direct energy conversion device. It is heartening to learn that design and development of collectors for low, medium and high temperature applications have been undertaken as part of a national programme.

New Information Policy

THE EXTENT of media misuse in recent years has understandably led Shri Morarji Desai to promise constitutional safeguards for the freedom of the press. And he is not going to grudge if the freedom of the press is "used with a vengeance". He said it was "the business of the press to annoy the government". He has equally set his face against any propaganda by government media. Their task is the presentation of totality of information. Even where government control of certain media like the films is an inescapable social responsibility, it should be such as to preserve the core of freedom of information. On behalf of the central media at least, he has promised that they will be truly national and not partisan.

One is not very sure if the communication bureaucracy fully understands the import of Shri Desai's policy statement. The planning commission has also not given any indication of understanding the significance of the new communication policy. The incremental approach is sought to be applied even here, whereas a basic idea debate is what the situation calls for.

Communication policy will have to fit into the general scheme of raising the cultural, social and economic levels of the rural people. Government must shed the wholly untenable responsibilities like organising film festivals, financing films, regulating the titles of journals, bringing out a year book on the press, film censoring and the like. Both film censoring and allotment of titles should be governed by law and violations can be settled by courts, through autonomous agencies like the press council with statutory powers.

News agency financing should be by parliamentary enactment, not through government doles. Most of the central and even state communication infrastructures must be dismantled here and now and the ministry of information and broadcasting has no rationale to exist, except that a minister of information may be a kind of chief spokesman of the government. Even if this extreme step is considered inopportune, a great simplification of the communication infrastructure is called for

As for Radio and TV, we will have to think of a few thousand low power transmitters, to be administered by local bodies, even if they do it irresponsibly. Similarly, exhibitions, people's art, posters, publication of literature, film production and projection, oral communication etc. should become the pace-setters of a cultural revolution, which is possible only if at least in each block there is an autonomous infrastructure. The dynamics of such a policy will be such as to lead to an efflorescence of people's culture.

But then, as in other matters, a few "experts" are likely to reduce a national endeavour to pet ideas and schemes of spending. Even history cannot defeat the planning "experts" of this hapless land. And if the course of the Shah Commission has revealed anything, it is this . that a few clerks—call them chief secretaries, secretaries or directors—did rule this land. The existence of information ministries and departments are at least partly responsible for this great disgrace.

Federalism : New Demands

SHRI MORARJI DESAI'S suggestion that land revenue and land management be given to the

panchayats and that all government functions performed by local bodies be transferred to these bodies takes the controversy over federalism to its logical end. Shri Desai, in his address to the central council for local self-government and urban development has affirmed again a view widely held that democracy and decentralisation go together. His reference to obligatory elections to local bodies at stated intervals and immediately after any supersession would imply a constitutional basis for local government.

Shri Desai posed to the state leaders asking for more powers whether they would stop interfering with the functioning of decentralised authorities. Proper functioning of panchayats, concerned with eighty per cent of the people, was crucial to the country's political health The metropolitan and other urban municipal bodies must set the pace of good local administration. They should stop demanding more resources without first showing some worthwhile return in the shape of services like keeping towns and villages clean and healthy.

Shri Jyoti Basu and Shri Namboodiripad who have been consistent in their demand for state autonomy, without the blackmail tones of the more rabid protagonists of devolution of power, may do well to spell out their views on these aspects. This will make it easier for them to demand from the centre as much power as they themselves are prepared to surrender to the local self-governing bodies

The Congress regime, more so in the last decade, had made a mockery of whatever federalism was provided for in an overwhelmingly unitary form of constitution. Shri Basu's suggestion that with the delegation to the states of effective financial, political and regulatory powers, the centre would be in a better position to guide them is worth examining. He was anxious that nothing should be done which might make the centre weak. Without any such risk, the states could have some plenary powers in planning, licensing and language policy These demands have been voiced by a cross section of political opinion in the country from time to time. The time for a constitutional exercise based on Shri Desai's views and strengthening as well as broadbasing the federal concept is now opportune

Shri H. M. Patel speaks

IN HIS speeches to the chief executives of banks, to tax executives and to newsmen in Calcutta, Shri H. M. Patel has sought to restore the perspective of his government's economic policy. With so much said of emphasis on agro-based industry, it needed to be stressed that government was aware of the role of the large sector. Shri Fernandes has also been seeking to clear the misunderstanding

Shri Patel did well to reject the irresponsible demand from the private sector for concessions. Such concessions, in the past, had only led the monopolistic trends. Government cannot any longer accept any role for ensuring adequate returns for private industry. The era of controls which had only served to give "protection" and maximise private profits should be deemed to be over. It is for the private industry either to accept new entrepreneurial challenges or just pack up and leave the economy in better hands. Shri Patel has speculated that the investors may be marking time The economic trends are not as bad as advertised A good monsoon, a down-trend in prices, slower rate of increase of money supply are all pointers to an evolving policy. Only industrial growth rate may be lagging behind—and the fault is not government's.

The Janata Party's emphasis on agriculture and agro-based industry for employment and other goals, increase in the availability of wage goods, control of inflation and removal of sectional and regional imbalances, goes with recognition of the place of organised and large scale industry in power, petroleum, fertiliser, steel, cement and engineering. But this sector cannot hope to have the kind of protection which it has so far had and which few other countries offer to industry. Investments in the right direction with a social commitment would bring in returns of a varied nature, not merely profits and dividends. The private sector in India has seldom been known for this kind of entrepreneurship and "aggressive investment policy".

Shri Patel has also done well to ask the nationalised banks to channel credit to the "tiny" sector. More branches will have to be opened. Within the next six or eight months, each block should have at least one branch. Direct credit to the weaker sections without intermediaries would lower the cost of borrowing Government funds would be used to subsidise interest rates so that the flow of bank credit to needy sectors increased—a kind of a "soft third window".

Employment and Irrigation Plans

THE INDUSTRY minister's reiteration of policy and Prof. Raj Krishna's observations about area plans have been reinforced by Shri Surjit Singh Barnala at a seminar on employment strategy. He has said that full employment will be assured in about 50 per cent of the development blocks in the next five years, through agriculture, irrigation and allied activities Priorities in planning are being recast. The design and structure of the five year plans are being changed and it will be possible to have realistic annual plans within a scheme of long-range perspective Shri Barnala has said that experience has shown that poverty, unemployment and under-employment are not likely to be solved by isolated sectoral programmes. What is now proposed is optimal use of local resources through purposive inputs of science and technology and involvement of the people

If an integral approach to problems of rural poverty is to succeed, the planning commission cannot escape thinking of an extra-departmental operational strategy.

It is from this point of view that the target of 17 million hectares to be covered by new irrigation schemes in the next five years has to be seen. Shri Barnala has spoken not only of the necessary outlays but also of the manner of their use Water management has never been easy and some kind of federal arrangement is necessary The constitutional exercises should take into account the need for even a federal negotiating agency, autonomous of the central and state governments but consisting of representatives elected by the legislatures.

Command area development would include construction of field channels, land shaping and preparation, input supply, crop planning, drainage, land consolidation and choice of different kinds and sizes of irrigation projects. New decentralised agencies outside the present administrative structures need to be created The central water and electricity authorities have to be broken into several units, which together with order similarly decentralised agencies, can constitute a new kind of area development infrastructure ; this, besides

doing a job, will also lay the basis of a wide dispersal of talent and of cultural change in the countryside. This is crucial.

Master plans for river basins with a view to tapping all available water resources much before the end of the century would also call for departure from a purely "processing" approach of specialised bureaucracies and for new national forms of thinking and action. A federal agency, associating a broad front of professional and political opinion, can make the task easier. State-level multi-disciplinary teams recommended by state irrigation ministers should be supplemented by a radical scheme of extra-departmental approach.

It is refreshing that irrigation ministers have recognised the folly of neglecting tanks in drought-prone areas. A priority programme of their renovation and checking of silting has been suggested. Low-lying areas in villages can be converted into tanks.

Of even more fundamental importance are the recommendations on pragmatic personnel transfer and training policies, delegation of financial powers to engineers, statistical support to irrigation departments, preparation of histories of major projects and social and environmental consequences of irrigation schemes. But it is doubtful if acceptance of central responsibility in various matters including cement allocation is the best way of encouraging local initiative. Target orientation would presuppose an injection of some kind of commercial culture in public sector operations.

There has been doubt about the competence of the central apex body to process schemes of a gigantic nature like the garland canal scheme and Shri K. L Rao's ideas of water transfer from surplus to deficient areas. Besides, vested interests develop in any established bureaucracy. Imagination and innovation are the first victims of career-based services. Unless the government makes the task of development "national" and not "departmental", the next twenty-five years will not be vastly different from the past twenty-five years.

"Drought proneness" in India goes with "flood-proneness". What a pity that not even a third of the surface flow of water in our rivers is used for irrigation! Arid and semi-arid areas accounting for some 30 per cent of grain production continue to be neglected in irrigation plans. Commercial methods of financing projects are repeatedly overtaken by short-sighted surrender to equally short-sighted lobbies. Even a sum of Rs. 20,000 crore is not stupendous if only there is a will to convulse the country in an ecstasy of forward movement.

The only way is to bring the people into the picture. The new planning commission is yet to show any evidence of appreciation of this major factor

Labour Law Renovation

IT IS good that state labour ministers have been able to agree on most of the recommendations of the 30 member committee about a comprehensive law on industrial relations. A bill is proposed to be placed before Parliament in the current session. Different acts dealing with trade unions, industrial employment and industrial disputes are to be integrated. Some state laws are also likely to be incorporated into the new measure. One major effort will be to make conciliation speedier as well as more effective and useful.

Security of employment, uniformity of minimum service conditions and relief during adjudication of disputes are all contemplated. What, possibly, has not been taken into account is the impact of all this on the new policy for the unemployed. Trade union economism has been a major factor of underdevelopment. Even politically-oriented trade unions have shown little concern for the vanguard role of the working class in social revolution. It is not as though a legal framework, talked about by Shri Ravindra Varma, for cordiality in industrial relations, does not altogether exist. Further refinements are always possible but the main problem is that each new genuine effort becomes the springboard of further trade union irresponsibility. Shri Varma has spoken of the "legitimate interests of workers and industry". What are these "legitimate interests"? As understood by them, these seem to be more wages, allowances and other benefits on the one hand and more profits, greater protection, never-ceasing assistance and escalating concessions on the other. There is neither the excitement of work nor the challenge of enterprise. If the caprice of the employer is to be curbed, as it should be, the total insensitivity of the workers to social responsibility has also to be tackled and tackled firmly.

The wisdom of involving government directly in industrial relations is doubtful. There could have been an independent statutory body to which implementation of a parliamentary policy could have been remitted. One hopes the energetic union labour minister and his counterparts in the states have not been stampeded into a certain course of action by the present state of industrial relations.

A basic approach to industrial relations in tune with the new employment strategy would have been more appropriate. The manner in which this particular problem has been tackled illustrates the harm of compartmentalised approaches to basic social and economic matters.

Partisanship Between Peoples

BOTH EXPLICITY and otherwise, Jayaprakash Narayan has repeatedly and abundantly made it clear what, he thinks, should be our attitude to struggles for freedom and democracy in other countries including some of our immediate neighbours. The government, of course, has been at pains to explain that JP holds no official position, in order that it may not be accused of interference in the internal affairs of other countries. This "high" principle of international "morality", one presumes, would not come in the way of our recognising that some other governments were not trammelled in this manner in openly espousing the cause of Indian democracy during the emergency.

JP himself is conscious of the sensitive nature of this issue. He does not want India to depart from diplomatic conventions. But the people, he has said, "who have only recently liberated themselves from dictatorship" will not hesitate to lend their support to the struggles for democracy elsewhere.

He has drawn the attention of dictatorial regimes to the lesson of history and asked them to give up repressive policies, restore fundamental freedoms, hold free elections, abandon the course of mass arrest and liquidation of political workers and move away from theocratic politics.

The people of India cannot pretend that they have no stake in freedom and democracy elsewhere. "Democrats of the world, Unite" should be the standard of a new international movement when the machine and the state are threatening to annihilate humanity.

Fearlessness In Administration

SHRI CHARAN SINGH has had more than one occasion in recent days to speak and write about

norms of behaviour in administration including police administration. He has also spoken with anguish about double standards in judging arrests of top administrators and men of lower status. The Shah Commission, only a few days ago, heard of how a junior government teacher—a woman—and a senior officer, more or less similarly treated during the emergency—received different kinds of solicitude in high places. Shri Charan Singh has been of the view that corruption cannot be removed unless it is dealt a mortal blow at the top echelons of government, political as well as administrative. Seeking the support of the press and other sections of society in this "gigantic and thankless" task, he has said that without this support, the Lok Pal or other vigilance devices will not be as effective as they should be.

Consistently, he has asked the public service commissions not to entertain any recommendation from politicians and others, however highly placed. It is a little refreshing to hear a home minister telling policemen not to obey orders, even from a minister, which they considered illegal. Honesty and fearlessness, besides efficiency, are more necessary in the police force than in other branches of administration. Shri Charan Singh has promised that the proposed national police commission would be asked to ensure that the police force resists illegal orders.

The question often asked is how anyone will be able to decide on legality. The answer is simple. It is each individual. The problem is not one of knowing, but one of fearing the consequence of defiance. That was why Shri Charan Singh would not blame a policeman in a circumstance of fear even in very high places. But our salvation lies only in ethical sense and preparedness to accept its consequences.

Need For a Thorough Probe

IT IS happy augury for the future course of Indian politics that two members of the AICC have asked for a highlevel probe into some recent plane accidents involving important political leaders. Shri Chavan's presence at the airport to greet Shri Morarji Desai on his return from Jorhat and Shri Brahmananda Reddy's message had already set the tone and pace of a new political ethos in the country.

The two AICC members, in a joint statement, have referred not only to the Jorhat accident but to the fact that aircraft carrying leaders like Shri Chandra Sekhar, Shri George Fernandes, Shri Biju Patnaik and Shri Bahuguna had suddenly developed faults. About the Jorhat mishap, these two congressmen have expressed surprise that this could have happened to an IAF plane.

The Times of India, after saying that the countrywide joy over Shri Desai's miraculous escape is tempered by the tragedy attending the brave members of the crew, has remarked that what the pilot executed was clearly a nose-dive not a belly-landing, suggesting that the crew might have decided to sacrifice their lives for a greater cause. The nation's gratitude to these courageous and dedicated men will be beyond measure.

We must suspend judgement till the obligatory enquiry is over. The taped record of the conversation between the pilot and the control tower may throw some light.

Even so, a lingering doubt—implicit in the commercial pilots' statement—will continue to exist whether there has been negligence, even if there was not dirty work at the crossroads. The government owes it to the people to make them feel assured that some deep conspiracy was not afoot. The threats to our nationals abroad should not also be taken to emanate from one source only. Safety of our nationals apart, unearthing of any possible mischief by people with a lot of resources is equally important.

New Direction To Education

JP's NOTE to the government stressing the priority of educational reform has come not a day too soon. "The foundations of freedom and equality have to be laid as much by education as by the reconstruction of political, social and economic institutions". He has begun at the beginning. The men who head the key institutions should be of the right kind. Their colleagues should also be men who are not "primarily careerists". Commitment to values should decide their appointments. Dead uniformity in university courses should be avoided. Universities can use resources to better purpose by division of diverse educational goals. Even in a single subject like economics, if metropolitan universities specialise in banking, for instance, provincial universities can develop agricultural economics. Massive programmes of non-formal education will also have to be undertaken. The young men and women who left college to take part in the Bihar movement should be able to get education of a kind more meaningful than what they gave up. The bureaucratic approach has frustrated early crash efforts to mobilise teachers and students. There is enough idealism in the country The disproportionate outlay on higher education should be corrected. Such education should be made self-financing, except that deserving students from economically backward families could be given loans to be repaid in instalments when they start earning. Professional education, highly rewarding, should finance itself

Referring to the brain drain—particularly the emigration of doctors—JP has said that the right facilities should be created for these specialists to work at home, particularly in the villages. Rejecting the notion of high incomes for beneficiaries of higher education, he has stressed the need of a well-conceived incomes policy. He has posed this as a challenge to our economists and social scientists. He has pleaded for special facilities for the under-privileged groups not only at the point of entry but throughout the educational carreer. The policy should be such as not to create a new elite among these groups indifferent to their fellowmen

He has asked for a national debate on these ideas as a prelude to revolutionary and enduring change within the framework of free institutions. Will our professional intelligentsia think more of these matters than of their privileges, status and emoluments?

Politics of Prices

ARISING FROM the decision on sugar policy—both distribution and pricing—is a comment from Shri Balraj Mehta in the *Indian Express,* which concludes as follows :

"A fundamental reorientation of pricing policy, which will give precedence to the requirements of social consumption and economic development over the current consumption demands of what are called "viable" groups and classes has far reaching implications. It is doubtful, of course, that a total and decisive break with the established price pattern will be

possible for the government. It will hurt far too much sections, groups and classes which constitute what may be called the viable and reliable social base not only of the present government but of the established power system and structure and will be considered politically not feasible. But at least, some element of rationality will have to be introduced and the more marked distortions and anachronism in the structure of relative prices will have to be given up with the aim primarily of minimising losses on past investments, recovering a substantial part of the cost of production of such intermediate goods as coal, steel, cement and fertilisers and eliminating subsidies which are patently monopolised by the upper income groups in urban and rural areas. The finance ministry, harassed by subsidies and lean domestic resources in its hands, is known to be keen for some adjustments in prices on these lines and is trying to caution against succumbing to populist pressures on prices The planning commission should be expected to back up this effort if its "realistic" scheme of financing developmnt is not to be wrecked by the current trend towards squandering resources in current consumption."

Subsidies, in any event, are not, as is often supposed or advertised, always for the poor and the down-trodden ; often they are at their expense.

Preventive Detention

SHRI DESAI is credited with the view that, along with the obnoxious aspects of the inglorious 42nd amendment, other legal traces of the emergency should be wiped out soon. A bill for the repeal of MISA is on the cards. Ironically, the J&K ordinance (preceded by the Madhya Pradesh one) has come in the context of a general public disapproval of detention without trial The reasons given by the state governments concerned may be sound enough There is always a threat from various kinds of sources—whatever the intentions, honourable or not so honourable—more so in the sensitive states. But the answer to these threats is more openness of polity and governance, not less. Preventive detention, in one form or the other, has been on the statute book almost since the British left (and before, of course) Charges of misuse are no longer challenged

A free society, an open society, clearly is exposed to all manner of risks Either we opt for a completely closed society or we are brave enough to face their risks Compromises lead to degradation There is no escape, in a free society, from creating in the people a stake in such a society. Honest administration, national consensus on basic issues, a firm rejection of the politics of cleverness and petty confrontation, increasing levels of openness and heightening the people's consciousness are the best ways of meeting the threats.

It is a self-deception to think that security or safety is best preserved by extraordinary police powers At best this is panic, at worst, this is an index of irresponsible politics at different levels

Farewell to Alms

THIS IS how a reporter describes the proposal to end beggary through welfare measures The 1971 census put the figure of beggars in the country at more than a million It is proposed, as reported, to combine public vigilance with humanitarian social approach to tackle this problem. Diversified institutional patterns to classify beggars as able-bodied, disabled and habitual are being thought of. Many states have laws banning beggary.

The new approach is very unlikely to be rewarding. Only two simultaneous actions can work—one, an assurance of full employment as well as homes for the unemployed, disabled and destitute ; and two, a public movement against beggars in the circumstance of such full employment.

Multinationals

THE HINDUSTANI Movement has asked for a great reduction in the share of multinationals and big business houses in the producing of soap and other consumer items Without this, all talk of encouraging the small sector will be idle. The reduction suggested is as much as 75 per cent of the present output by these big houses The method proposed is prohibitive excise.

The main point made by the Hindustani Movement is that, the big marketing network of these houses and other advantages, they can thwart any competition from the small sector.

Among the items mentioned which can be allotted to the small sector are detergents, talcum powder and toothpaste It is amazing that multinationals have been allowed in these fields at all. What is tragic is that small units, located, in small townships, have been wiped out by these multinationals. One company alone has usurped some Rs. 200 crore of production from the small sector It seems financial institutions have been underwriting the shares of these sharks

If this was self-reliance, talked about by the protagonists of the previous regime, let us have less of this self-reliance And let us have a more native and intelligible version.

Educational Concessions

Under the directives of the Ministry of Education and Social Welfare, the State Governments/Union Territories have been giving a number of educational concessions to the children of officers and men of the Armed Forces killed or disabled in action during the 1971 conflict with Pakistan, in institutions under their control.

Some of the concessions available up to and inclusive of the first degree course were

(i) Complete exemption from tuition and other fees levied by the educational institutions concerned, including charges for the school bus and the actual fares paid for railway pass or bus pass certified by Head of Institutions ,

(ii) Grant to meet hostel charges in full for those studying in boarding schools and colleges;

(iii) Full cost of books and stationery , and

(iv) Full cost of uniform where it was compulsory

These concessions were subsequently extended to the children and widows of Officers and men of Armed Forces killed or disabled in 1962 and 1965 hostilities also

However, a number of war widows belonging to rural areas could not avail these facilities as some of the schools e g central schools did not have hostels attached to them To help the children of such war widows it has been decided that their children be admitted to such schools and colleges, whether of Central Government or State Governments which have attached hostels and that some percentage of seats be reserved in the hostels for these children.

Greatness of Sardar Patel

Charan Singh

IT IS always the tragedy of great men that some signal contribution made by them to a national or international cause is so often emphasised as to obscure a whole life of striving, achievement and sacrifice.

Sardar Patel's misfortune seems to be that he planned and executed brilliantly the integration of the princely states with the Indian mainstream. In describing the Sardar as the architect of Indian unity, we do him a disservice in the sense that we ignore that this role devolved upon him as a natural culmination of a great political career, marked by determination, dedication, discipline and loyalty.

How Sardar Patel, used to a life of comfort, came under the spell of Mahatmaji is well-known. That he got the title of Sardar from his courageous leadership of the Bardoli Satyagraha is also equally known. Perhaps what is not as well known is that at the Bombay AICC at the Gowalia Tank maidan in 1945 immediately after the release of national leaders, Sarat Babu said Vallabhbhai Patel was no longer Sardar of Bardoli, he was Sardar of India.

As Chairman of the Congress Parliamentary Board, he displayed great understanding and firmness in ensuring that the Congress Ministries formed in 1937 did not lose sight of the basic goals of the organisation.

The Sardar is always called the "steel man of India". But those who have known him intimately have always spoken of his gentleness in dealing with men and affairs and of his deep humanity. Many people including Panditji and several Congressmen, had reservations about continuing the administrative tradition of the British-bred I C S. But the Sardar's attitude was one of recognition of the good work done by the officials in the crucial formative years of our independence. All the civil servants, who had worked with him, speak of him with affection as much as with deep respect.

Loyalty and self-effacement

The Sardar had a strange quality of commanding the loyalty of those with whom he worked—colleagues as well as what may be called subordinates. This was as much due to his preparedness to accept responsibilities even for the lapses of others and stand by them when they were under attack, as to his ability for self-effacement in a cause. This was the greatness of the trimvirate who led our freedom struggle. Mahatmaji, Panditji and the Sardar did not agree with one another on many things. On several matters the differences were fundamental. Yet, never once did they give the impression of a divided leadership. They were prepared to subordinate their individual strong views to a great cause. This did not mean that there was a facade of unity or any attempt to brush the differences under the carpet. The differences were fully discussed and even when they were not resolved, they were not permitted to come in the way of a dedication to a greater cause.

Even as Panditji and the Sardar accepted without question Mahatmaji's leadership, the Sardar accepted without reservation Panditji's leadership, even though he was 14 years older than Shri Nehru. His respect for and loyalty to the chosen Prime Minister were complete to the extent that when the Jaipur AICC passed a resolution against Panditji's wishes, the Sar[illegible] was the first to say that he would rather resign th[illegible] see Panditji's wishes being ignored.

This is a quality we all greatly need to imbibe in [illegible] political life today, when the nation seems to be [illegible] the crossroads of history and is beset with a vari[illegible] of bewildering social, economic and political problem[illegible] Even if we have fundamental differences with o[illegible] another in the same party or between different parti[illegible] we should learn to discuss them fully and also wo[illegible] unitedly for a great national cause. The only cond[illegible] tion we should insist upon is bonafide acceptance [illegible] the imperatives of a democratic polity, seeking [illegible] bring about a non-exploitative egalitarian socie[illegible] based on human values, honesty and burning passi[illegible] for serving the down-trodden.

The greatness of men like the Sardar was the[illegible] vision of India and her future. For that cause, the[illegible] would compromise everything. What they would n[illegible] compromise was the country's integrity and i[illegible] dependence and its democratic development.

New Administrative Culture

Shri Jaya Prakash Narayan has said that if the Sard[illegible] had lived he would have fashioned a new administra[illegible] tive culture. I fully agree with J P. Our best tri[illegible] bute to the Sardar would be not only to preserv[illegible] India's integrity and democratic structure but to in[illegible] duce in the administration a new culture of efficiency selflessness, incorruptibility, discipline and fearles[illegible] ness. The Sardar would have been the unhappies[illegible] man to see that an administration, which he had don[illegible] so much to bring into being, was overtaken by demo[illegible] ralisation during the emergency. Equally distress[illegible] ing is the extent of corrupion in our public lif[illegible] political, administrative and professional. We mus[illegible] work objectively for a new administrative system wher[illegible] the scope for corruption will be greatly reduced, i[illegible] not eliminated, and where casteism will not dominat[illegible] the thinking of the senior civil service, generalist o[illegible] specialist.

It should be our common endeavour to imbibe fro[illegible] the Sardar the qualities of self-effacement, discipline loyalty, determination and, above all, uncompromis[illegible] ing patriotism.

Sardar's Work in Gujarat

Prabhudas Patwari

ON THE death of Sardar Vallabhbhai Patel, o[illegible] 15th of December 1950, Shri Vinoba Bhave befor[illegible] a gathering of villagers at his ashram, observed tha[illegible] "a towering personality of the eminence of kin[illegible] Janaka has passed away from our midst. Amids[illegible] palatial glitter and royal pomp he had lived a detache[illegible] life of King Janaka. Due to his presence in th[illegible] government, the people felt that the ship of the countr[illegible] was safe in his hands." This, to a degree epitomise[illegible] Sardar's character and also refers abstractly to thos[illegible] services of the Sardar at the altar of Mother Bhara[illegible] that brought him a perennial name.

In all humility, when I think of the Sardar of th[illegible] later twenties when he had galvanised into life th[illegible] entire peasantry of the Bardoli taluq to giv[illegible]

ureaucracy one of the most decisive fights of the day with the matchless weapon of non-violence, I feel too hat it was God's abundant mercy upon me to be able o devour with avidity those stirring sermons of the Sardar that instilled vigour and heroism in people ike a magic touch and transformed their timidity nto real valour. Like Gandhiji, Sardar made men ut of clay.

SYSTEMATISED RELIEF

Sardar's work in the relief field is practically an nknown matter outside Gujarat. But in that, he ook special delight and it will be truer to say that is through this service of the *daridra Narayana* that ardar derived his superhuman strength to serve the ational cause.

It may rightly be said that the Sardar was a pioneer f systematised relief work in Gujarat. As a Munici- al Councillor (1918), amidst the outbreaks of plague nd influenza, the Sardar would rather be by the side f people than leave the city for safety. Barrister Vallabhbhai of those days used to walk from *cherri* o *cherri* to give a word of comfort to the afflicted eople and cheer their sunken hearts. Can one icture the Sarder opening even temporary hospital or providing medical relief to the plague stricken but this is what Sardar did it without any ostentation.

The flood relief operations organised by the Sardar overed practically the whole of Gujarat when it was aid low by the unprecedented monsoon rains lasting ontinuously for almost a week (1927). On the mid- ight of the day when rains began to pour in torrents, he Sardar was sleepless. Coming out of his house, e walked towards a friend's house in pitch dark and ursting rains and took the friend with him. They ent round all the vulnerable spots of the city, and his done, they went straight to the Municipal Engi- eer, and waking him from his sleep, took him with hem to the Municipal Office. In no time, the staff ere summoned to duty and speediest steps were aken for the drainage of rain water and the city was aved from further ruination This was the exemplary ense of civic duty in the Sardar

Gandhiji was then convalescing at Bangalore He ired to the Sardar that he had no strength in him to ove from place to place and yet he would come if he Sardar approved of it To that Sardar replied to he effect that if he would wish to test them how far hey have imbibed his teaching of self-help and co- operation, better would it be if he could stay over here and recoup himself And Gandhiji heeded to he Sardar's advice, for he had abundant faith in the Sardar's innate and profound capacity to overcome his calamity on Gujarat. The Sardar's relief work ad then reached the remotest and far-flung villages f Gujarat. The efforts were so systematic and orga- ised that he could restore normalcy in Gujarat hardly n two months.

INSPIRING STORY

The Government was stunned at the promptness and horoughness of this effort, and thanks to the Sardar's itiative, it felt impelled to earmark funds to the ine of Rs two crore and more in the form of cheap ans and gratuitous money for the reconstruction of ouses of the thousands of homeless. The full story this mission of mercy will take pages. But suffice to say here that this episode is a most inspiring page his life-story and it had left its imprint on the life Gujarat to such an extent that whenever such lamities overtake Gujarat that distant scene of 1927 becomes vivid to our eyes and inspires us to render service to the people in distress.

Vallabhbhai

VALLABHBHAI Jhaverbhai Patel, one of the six children of Jhaverbhai Patel and Ladbai, was born on 31 October, 1875 at Nadiad in the Kheda district of Gujarat. The family was an agriculturist one, of the Lewa Patidar community. It was poor and had no tradition for education. Vallabhbhai's childhood was spent away from books in the simple atmosphere of his village home He received his early education at Karamsad and then at Patlad, a small town, some eleven km away. He matriculated from the Nadiad High School in 1897. He passed the district pleader's examination three years latter and set up as a lawyer at Godhra.

He moved in 1902 to Borsad a town in Kheda where his elder brother, Vithalbhai Patel, had set up practice and had more work than he could cope with singly. Vallabhbhai became quite popular as a defence lawyer. He became such a terror to the authorities that the magistrate's court was transferred from Borsad to Anand. But the court was transferred back to Borsad after a year. The reason for the great success of Vallabhbhai in the criminal cases was not so much his knowledge of the intricacies of law as his abundant commonsense and his knowledge of human nature. He started for England in 1910 and joined the Middle Temple He took his study so seriously and conscientiously that he topped in Roman law, securing a prize, and was called to the Bar at the end of two years On his return to India in 1913, he set up practice in Ahmedabad and made a great success of it

It was in 1917 that Patel came in contact with Gandhiji, having been impressed by his leadership in the Champaran Satyagraha. In 1917 he was elected for the first time as a municipal councillor in Ahmedabad From 1924 to 1928 he was chairman of the municipal committee. In 1917 he was also elected secretary of the Gujarat Sabha, a political body which was of great assistance to Gandhiji in his campaigns Vallabhbhai became one of the comrades of Gandhiji in solving the labour trouble of Ahmedabad He suspended his lucrative practice and plunged into the national struggle

The association with Mahatma Gandhi became closer during the Kheda Satyagraha in 1918, which was launched to secure exemption from payment of the land revenue assessment since the crops had failed. Gandhiji said that if it were not for Vallabhbhai's assistance "this campaign would not have been carried through so successfully"

The five years from 1917—1922 were years of popular agitation in India Vallabhbhai left his practice for good and gave himself up wholly to political and constructive work Then came the Bardoli Satyagraha.

THE BARDOLI SATYAGRAHA

There used to be a periodic assessment of land revenue in Bardoli taluk after every thirty years. After a survey by the settlement commissioner the land revenue was increased by 30 per cent. This sudden arbitrary increase hit heavily on the smaller farmers So a group of peasants approached Vallabhbhai. Patel wrote to the governor to postpone the recovery of the revised land revenue The request was turned down. Now Vallabhbhai devoted all his

time and energy to organising, uniting and rousing the people.

The epic struggle of Bardoli launched in 1928 constitutes one of the most glorious chapters in the history of India's struggle for freedom. It was a grim and bitter fight. The basic traits of Sardar Patel's personality, as highlighted by this struggle, were an indomitable will and perseverance, a fine sense of strategy and calculation, complete identification with the espoused cause, total disregard of sentimentalism and an iron discipline imposed upon himself. Bardoli, in fact, was a unique personal triumph for Vallabhbhai who was given the title of 'Sardar' by the nation. This achievement at Bardoli brought him to the forefront of all India leadership. Vallabhbhai was the first of the national leaders to be arrested in the famous Salt Satyagraha launched by Gandhiji In March 1931 Vallabhbhai presided over the 46th Session of the Indian National Congress held at Karachi which was called upon to ratify the Gandhi-Irwin pact after Bhagat Singh had been sentenced to death. It was in that tense atmosphere that the Sardar guided the deliberations. The Karachi session was notable for the adoption by the Congress of fundamental rights which were later enshrined in the Constitution of India. The failure of the Round Table conference found Vallabhbhai Patel lodged with Gandhiji in the Yeravada Jail where they were together for sixteen months from January 1932 onwards. Vallabhbhai spent another year in the Nasik Jail

In the Wider Arena

After the withdrawal of the civil disobedience movement in 1934, the Gujarat Vidyapith was revived. Vallabhbhai was made its Vice Chancellor and later, after Gandhiji's death, Chancellor. He was among the front rank leaders who appreciated Gandhiji's intention of resigning from the Congress in 1934 to devote himself to the revival of village industries. After the Bombay Congress the Sardar extensively toured India This helped the Congress win a resounding victory in the elections for the central assembly. Vallabhbhai was in overall charge of the Congress election campaigns both in 1937 and 1946 and established an effective machinery not only for winning the elections but also for co-ordinating the work of the ministries and ensuring that the congress policies were implemented faithfully.

When the Congress accepted office in 1937, Sardar Patel became the chairman of the parliamentary subcommittee of the party to guide and control the activities of these ministries. In this capacity he had to co-ordinate the work of the ministries, deal firmly with opportunists and recalcitrants in its ranks and guard against the machinations of the governors Vallabhbhai Patel was arrested on 17 November, 1940 for individual civil disobedience launched by Gandhiji He was released on 20 August, 1941 on grounds of health The famous Quit India resolution was passed in Bombay on 8 August, 1942 Vallabhbhai, along with other members was arrested on 9 August, 1942 and detained in the Ahmednagar Fort. He was released on the eve of the first Simla Conference As one of the chief negotiators of the Congress he made a valuable contribution to finding a peaceful constitutional solution to the problem of India's independence.

In September, 1946 when the interim government was formed, Sardar Patel became the Member for Home Affairs and Information and Broadcasting. When India attained independence, he became the Deputy Prime Minister and also assumed charge the newly created ministry of states.

Reorganisation of States

The Indian nation will remember with gratefuln Sardar Patel's work in reorganising the Indian sta and integrating them with the Indian union. As t minister in charge of states, he was called upon tackle the intricate and baffling problem of the sta integration. There were 560 princely states to b integrated with the Indian Union. He accomplish this task with the ruthless efficiency of a great a ministrator. Except the rulers of Junagadh ar Hyderabad, the remaining Indian princes read th writing on the wall and gracefully cooperated wi the fast moving times The geographical position Junagadh made it obligatory on the ruler to acce to the Indian Union. Junagadh was merged wi Saurastra Hyderabad was a hard nut to crack Th Nizam, was considered to be the richest man India. He issued a *firman* on 11 July, 1947 that o the lapse of paramountcy on 15 August, 1947 Hyderabad would become a sovereign independen state. After some consideration when reason faile with Nizam, Patel was convinced that police actio was the only solution Indian forces marched int Hyderabad territory on 9 September, 1948 to put a end to the threat to the security of India. On 2 November, 1949 the Nizam accepted the soverei of India

The merger of several adjoining states, with the varied and diverse problems, into different units wa a task demanding all the best from an administrato and statesman Sardar Patel first turned his atten tion to the states of Orissa and then to the states o Rajputana and Kathiawad The 222 states of Kathia wad heeded Patel's advice and on 15 February, 194 the united states of Kathiawad was formed No this movement of merger gathered speed and ve soon the states of Rajasthan, Punjab, Himachal Pra desh and central India merged themselves into unio of Rajasthan, Pepsu, Saurastra, Himachal Prades and Travancore and Cochin. Later on Pepsu wa merged in East Punjab, Baroda and Kathiawad int Bombay, Indore into Madhya Pradesh Travanco and Cochin became Kerala. Mysore remained a sepa rate province This completed the work of integratio without any bloodshed but with the goodwill of th people

He sorted out the problems of partition, restore law and order and dealt with the rehabilitation o thousands of refugees with great courage and fore sight. He formed a new Indian Administrativ Service, to provide a stable administrative base to ou new democracy Vallabhbhai devoted his organisa tional talent and energy to achieve the difficult task He was thus one of the chief architects and guardian of India's freedom and his contribution towards con solidating the freedom of the country remains un rivalled

His death at Bombay on 15 December, 1950 re moved from the Indian scene one of the most ou standing figures of modern Indian history.

Work is undoubtedly worship but laughter is li Anyone who takes life too seriously must prepa himself for a miserable existence Anyone wh greets joys and sorrows with equal facility can rea get the best of life.

Sardar Pat

ROLLING PLAN

A Step Towards Democratisation

DR. J. DUBASHI

IF YOU are driving on a straight road with very light traffic, all you have to bother about is your oot on the accelerator. You can maintain a steady peed without worrying too much about the other raffic and also be pretty certain of arriving at your estination in time.

On the other hand, if you have to drive through eavy traffic on a busy road crowded with all kinds f vehicles from bullock carts to oil tankers, speed the least of your worries. You have to keep your yes on the brakes, the gears and the accelerator, and lso watch the traffic signals You are in fact not ntirely your own master and there may be times when ou have to give way to others.

This is, in rather simple terms, the main difference etween the old type of planning we used to have nd the new concept of rolling plan that the Janata Government has now introduced This is not such a evolutionary thing that it is made out to be; in fact, nder the circumstances growing and mixed economic, raffic, this is the only sensible approach A rolling lan is designed to keep track of the situation as it hanges from time to time, from year to year, in fact, nd make suitable amends and all alterations as one oes on, without losing sight of the ultimate destination, but also without getting stalled in the middle, s has happened a number of times in the past.

When planning began in this country, things were retty simple. There was only one big steel plant, nstead of the present five. There was only one nedium-sized fertiliser factory instead of at least a lozen large ones today There was no oil refinery—ow there are eight. There were power stations only n the large cities—now we even have atomic power tations. You can see, therefore, how the traffic has ncreased and why one man—or even a group of people-sitting in air conditioned rooms in the planning commission cannot take a decision that can be binding or the next five years. Life today is much more complicated and many things are beyond one's control. For instance, when the crude oil prices shot up fourfold in 1973, the entire planning in this country collapsed. The fifth five-year plan had to be scrapped and it took three long years to prepare another one In the meantime, prices began rising—they went up by 30 per cent in a single year—but since the government was committed to the plan, there was no check on spending. If we had a rolling plan then, the plan programmes would have been immediately revised and spending brought under control. If we had introduced the system of flexible planning five years ago, we would not be in such a mess today.

AWAY FROM RIGIDITY

India is still basically an agricultural country. Nearly hree-quarters of our people are engaged in farming nd roughly half our national income, that is, the ersonal income of all of us added together, is still erived from rice, wheat, jowar and similar farm products. Now, when there are droughts, and we have evere droughts at least once in five years, there is a sharp fall in income from this source, with the result that the entire pattern of resources is effected. However, since the planners are committed to their plan and demand their pound of flesh, the investment pattern cannot be touched. In the absence of real resources, the government is forced to resort to deficit financing by printing paper money which is not backed by anything tangible and is, therefore, useless money. The net result is that prices go up, and everybody suffers, particularly the poor people and people in rural areas.

We should not, therefore, be surprised at the results that the old kind of planning has achieved. While national income—real income, that is—has gone up two and a half times since planning began, prices have gone up nearly four times, an extraordinary achievement indeed. If there had been rolling plans, or what we may call, developing plans, the government would have been forced to cry halt to unnecessary spending out of non-existent resources created by keeping the currency note printing presses busy working overtime. The government's hands are tied by the rigid plans which do not permit any alteration to suit the changing circumstances.

There is also another point which those who have never been involved in the planning mechanism may not be aware of Who draws up the five-year plans ? The planning commission But the planning commission is a huge body which occupies a whole five-storeyed building in Parliament Street in New Delhi next to the Reserve Bank There is a small group of economists who sit down with their slide rules and work out targets for different products for the next five years, and even for the next fifteen years. These people have very little direct experience of industry or its working and do not normally come into contact with people who actually work in industry and who have a feel of the market Their forecasts are exercises in imagination which, of course, they are very good at But it is one thing to fiddle with nice-looking formulae on paper, and quite another to convert imagination into reality. You will be surprised to learn that nowhere in the world have long-term projections ever come out right in practice.

In England, there was once an attempt to work out detailed projections by computer, but the results were so farcical that they became the laughing-stock of the country No wonder, the first plan the British ever drew up was dropped like a hot brick

IMAGINATION AND REALITY

The new concept of the rolling plan will not do away entirely with the slide-rule boys in the planning commission but it will have its ears cocked towards the actual shape of the economy as it develops from time to time. A plan that ignores feedback information from the people—for whom the plan is actually meant—is self-defeating. In fact, it goes against the grain of democratic functioning Ordinary people who buy and sell in the open market should have as much say in the formulation of the plan as the so-called experts The second plan was drawn up by one man, Prof P. C. Mahalanobs, and it was pushed through very much against the opposition of quite a few people, including Congress leaders like Dr. B. C. Roy and economists like Prof. C N. Vakil. It was high time that the planning process was democratised and left to a handful of the so-called experts. War, they say, is far too serious a matter to be left to generals, planning is also far too important a matter to be left to planners.

The rolling plan is a compromise between imagination and reality and to that extent it will take into account both the long-term perspective and short-term day-to-day problems. The current old-style plan which is now in its fourth year will be chopped off at the end of the financial year, that is, by April, 1978, when the first year of the new rolling plan will begin. The new plan is likely to have a horizon of five years. But a new annual plan will be added.

At the end of every year, with firm targets for the first year and flexible targets for the next four years—this concept is actually in use in most large companies with world-wide interests and operations, and with sales that sometimes exceed India's national income. Our own defence ministry also follows the rolling plan concept. Even in the old-style planning, the planners conveniently took a plan holiday when things became a little tough, as they did for three years from 1966 to 1968 which happened to be the very first three years of Smt. Gandhi's prime ministership. In the new system, there will be no plan holidays; in fact, the planning commission will have to be quite alert and function with much greater discipline than before So, the plans will become flexible, and for very good reasons, the planning process itself will be much more disciplined This will increase the efficiency of planners all round.

PEOPLE, NOT THINGS

The new concept has come at a time when very objectives of planning are changing. All plans so far have been concerned with things—pow steel, machinery, fertilisers etc. rather than with pe ple. While the country may now be economica speaking more powerful than before, the people as whole have not benefitted from the plans, as the acc has not been on mass benefits. It is well known t there are more poor people today than were wh the plans began. Something, therefore, has go wrong, which the rolling plans with their accent employment are expected to put right. What is, af all, the use of big, grandiose plans if the final res is increasing poverty among the people and, at same time, growing power in the hands of a hand of people in the government ? The new-style plann will bring the people much nearer the governme and *vice-versa*, which is as it should be. The pri aim of the new government is to build an open socie and there cannot be an open society without an op economy, that is, an economy where decision-mak is also an open process and is not left in the hands a few experts We have had too many experts for too long; let the people have a say for a change. □

Multinationals and India

IN THE past quarter of a century, the world has witnessed dramatic development of multinational companies into a major phenomenon in international economic relations. Their size and geographical spread, multiplicity of activities, command and generation of resources around the world and the use of such resources to further their own objectives rival, in terms of scope and implications, traditional economic exchanges among nations

In a study entitled "Multinational Corporations in World Development", the United Nations defined multinational corporations as "enterprises which control assets—factories, mines, sales offices and the like—in two or more countries. This broad definition includes all foreign companies which operate in India through a branch or an Indian subsidiary

Multinational Corporations account for one-fifth of the world's output, excluding the centrally planned economies. Their production in recent years has been growing at the rate of ten per cent a year nearly twice the growth rate of the world output, and half as much as the world trade. The estimated level of production of the multinationals exceeds 750 billion dollars a year, which is greater than the gross national product of any country other than the United States Their direct investment is about 300 billion dollars, nearly half of which is from the United States. They are spread far and wide. In 1974, developing countries accounted for about one-third of the book value of foreign investments, as against one-sixth of the world's domestic product and one-fifth of the world exports.

SIZE, NATURE AND OWNERSHIP

Multinational Corporations (MNCs) are generally large-size firms with annual sales running into hundreds of millions of dollars. More than 200 multinational corporations have surpassed the one billion dollar mark. H. V. Perlmutter observes in his book, "Towards A Theory and Practice of Social Architecture" that by 1985 about 300 large multinationals will account for half the world's total industrial producti

Most of the multinationals enjoy predominantly o gopolistic market positions and are characterised by importance of new technologies, special skills or p duct differentiation and heavy advertising which s tain or reinforce their oligopolistic nature by mak entry of competitors more difficult.

The large MNCs have many foreign branches a affiliates Although almost half of some 7,300 MN have affiliates in one country only, nearly 200 of th have affiliates in 20 or more countries. In all, U firms account for about a third of the total number foreign affiliates. The U S. together with compan based in the United Kingdom, the Federal Republic Germany and France, account for over three-quart of the total foreign affiliates. Of a total estimat book value of foreign investment of about 165 billi dollars most of which is owned by MNCs, the U accounts for more than half; over four-fifths of t total is owned by the four countries

While the network of MNCs is world-wide, the bu of their activities is located in the market econom of the developed countries. Over two-thirds of the es mated book value of foreign direct investments a located in this area. Although developing countr have received only about a third of this total, t presence of foreign MNCs in these countries is ger rally of much greater significance relative to the s of their economies. Among developing countries, t western hemisphere has attracted an estimated 18 p cent of the total stock of foreign investment, Africa per cent and Asia and Middle East five per cent a three per cent respectively.

Manufacturing is at present the major activity MNCs. It represents a little more than 40 per ce of the total estimated stock of foreign direct investme of the main developed market economies. Petrole accounts for 29 per cent, mining and smelting 7 p cent and industries 24 per cent. Whereas

developing countries half of the estimated stock of investment is in extractive industries and a little more than a quarter in manufacturing, in developed market economies half of it is in manufacturing and about 30 percent is in the extractive industries.

By and large, MNCs exercise effective control over their foreign affiliates through complete or majority ownership, although at times such control can be exercised from a minority position as in the case of Japanese MNCs, where a somewhat more sizeable proportion of the affiliates are minority-owned ventures. About 80 per cent of the United States affiliates and 75 per cent of the United Kingdom affiliates are either wholly-owned or majority-controlled.

Only a few developing countries have a stock of direct foreign investment of more than one billion dollars. These include Argentina, Brazil, India, Maxico, Nigeria, Venezuela and five groupings of Caribbean Islands. These countries account for 43 per cent of the total stock of investment in developing countries, which is roughly the same proportion as that of their combined gross domestic product to the estimated total for all developing countries. In 12 countries in Africa, the Middle East and Latin America, the investment in either petroleum or mining exceeds 200 million dollars. More than 200 million dollars is invested in manufacturing in Argentina, Brazil, India, Mexico and Philippines. In India and Malaysia, investment in agriculture exceeds 200 million dollars.

U.N. Study

In recent years, there has been a growing concern over the operation of MNCs in the developing countries. The reasons why MNCs have come into worldwide attention was the exposure of an attempt by one of the largest MNCs to overthrow the elected government of Chile, followed by the U.S Senate Committee's exposure of the underhand dealings of the Lockheed Aircraft Corporation which led to the fall of the government in Japan. These incidents have created a fear among the developing nations and an apprehension about the financial power of the MNCs.

In 1973, the United Nations by its Resolution No. 1721 took note of the growing size of the multinationals and recommended a study in depth of the rise of MNCs and its impact on trade and development of other countries in all its interconnections. A group of eminent persons led by Shri L. K. Jha submitted a report on the subject in June 1974. The Department of Economic and Social Affairs of the United Nations also brought out a working report on "Multinational Corporations in World Development"

Important points made in the report by the group of eminent persons were :

(a) international corporations are organisations largely beyond the control of any single government ;

(b) their overall goal is worldwide profits without regard for what is best for an individual country ;

(c) the interests of the country where a subsidiary is established for the development of export markets are subjected to the market interests of the parent company ;

(d) parent companies do not make the most modern technology available to their subsidiaries ; and

(e) international corporations prevent the growth of locally-owned enterprises by aggressive and unfair competition.

That the developing countries are generally afraid of the activities of MNCs was also evident at the 21st Commonwealth Parliamentary Conference held in New Delhi from October 21 to 25, 1975. Deighton F. Grifty of Barbados pointed out that MNCs "did not regard themselves obligated to the interests of the region they were located in. They neglected training of the local people for top management position". There is also an "inherent danger in the existence of multinationals because at the time of crisis, these corporations were capable of diverting vast sums of money from one area to another which could bring about the collapse of the economic system".

Limcho Hock (Malaysia) pointed out that there was a genuine fear in south-east Asian countries that their economics might be controlled by MNCs : "Some MNCs operated in dubious ways and bribed politicians. In joint ventures, these corporations had only 40 per cent but their decisions were always over-whelming. Developing countries should exercise greater control to minimise the danger posed by such corporations to their economy and sovereignty".

The three-day seminar on MNCs which ended in Nagpur on 2 January 1977 also agreed that MNCs should not be allowed to go beyond the scope prescribed by host countries.

MNCs in Our Country

MNCs operate in India in two ways : (a) through branches established in the country and (b) through Indian companies which are subsidiaries of foreign companies which held more than 50 per cent of the paid-up equity capital.

There were 540 branches of MNCs operating in 1973-74 in India, the MNCs being incorporated in 34 countries outside India There were 482 branches of MNCs on 31 March 1977. Of these as many as 319 were branches of U.K -based companies U S - based companies had the second largest number of branches—88. Japanese, West German, Swiss, French and Canadian companies came next with 21, 12, 11, 8 and 7 companies respectively.

The assets of all branches of foreign companies in India at the end of 1973-74, aggregated about Rs. 1,790 crore. The British and the American based companies had the bulk of the assets with U.K.-based companies accounting for Rs. 1238.5 crore. Branches of companies of other countries with sizeable assets were Yugoslavia (Rs. 52 6 crore), Bahama Islands (Rs. 27 crore), Netherlands (Rs. 25.7 crore), Japan (Rs. 23 crore) and France (Rs. 22 9 crore).

Out of 540 branches operating in India in 1973-74, as many as 163 came under the broad head of commerce. Branches in the field of agriculture and allied activities numbered 115, business services, 87 and processing and manufacturing 82 These four industrial groups thus accounted for 447 or nearly 83 per cent of the total number of branches. Transport, communication and storage had 39 branches and construction and utilities 33. There were seven branches in mining and quarrying and 14 in personal and other services. Readers Digest Private Ltd. is the only multinational company operating in the field of journalism.

Indian Subsidiaries

There were 195 and 188 subsidiaries of foreign companies in India at the end of 1972-73 and 1973-74 respectively, and most of these were incorporated in the U.K. which had 131 branches. There were 171 subsidiaries of foreign companies as on 31 March, 1976.

The total assets of Indian subsidiaries amounted to Rs. 1363.7 crore at the end of 1973-74. Of this, the lion's share, that is, Rs. 829 crore or 60.7 per cent was commanded by the subsidiaries of U.K. Assets of subsidiaries of U.S., Canada, Switzerland and West Germany were Rs. 176.9 crore, Rs. 85.1 crore, Rs. 75.4 crore and Rs. 66 crore respectively, at the end of 1973-74.

As many as 137 subsidiaries or about 73 per cent of the total number were operating in the broad sector of processing and manufacturing with assets worth Rs. 1,255 crore. The next highest number of subsidiaries were in commerce—30, followed by transport and communication—23.

Majority of the Indian subsidiaries had assets less than Rs. 5 crore in 1973-74. There were 53 subsidiaries each with assets less than Rs. 50 lakh, and they accounted for 28 per cent of the total number of subsidiaries but their assets amounting to only Rs. six crore formed 0.4 per cent of the total assets of all subsidiaries. On the other hand, there were only 18 subsidiaries which had assets more than Rs. 20 crore and their total assets aggregating to Rs. 763 crore, accounted for nearly 56 per cent of the assets of all subsidiaries.

Profits before tax (PBT) of 180 subsidiaries in 1973-74 amounted to Rs. 195 crore. The ratio of PBT to assets and that of PBT to turnover for these subsidiaries worked out at 14.3 per cent and 9.3 per cent respectively.

Export Performance

A recent study on the export performance of Indian companies with foreign holdings was conducted by the Economic Times Research Bureau which looked at the export performance of companies with majority foreign holding in 1973-74 and 1974-75 in context of the guidelines issued by the government of India regarding the dilution of equity participation by foreign companies. The study showed that per unit realisation from the non-traditional manufacture (including government incentives for exports) in most cases was less than the realisation from the Indian market.

Exports constituted a little less than five per cent of the aggregate turnover of 46 companies with foreign holdings for which comparable data was available for the two years—1973-74 and 1974-75. In 1974-75, only four of these 46 companies had a ratio of exports to total sales of more than 10 per cent, the highest of such ratio being 20.6 per cent. Most of the companies operated at a ratio of less than or equal to 5 per cent for exports to total sales.

It is noteworthy that a large number of the companies under study had been subjected to the export obligation schemes of the government of India and, by the known records, have not fulfilled their export obligations to the extent expected. The government of India's import trade control policy, which provides for severe cuts in import licences to business units in a number of industries if the units export less than five per cent of their output, has, however, forced most multinational companies to export more.

Foreign Exchange Regulations

Under Section 29 of the Foreign Exchange Regulation Act, it is obligatory for all branches of foreign companies operating in India as also for Indian companies with 40 per cent and above foreign holdings to obtain general and special permission of the Reserve Bank of India to continue their existence.

On 1 January 1974, the Reserve Bank issued certain guidelines. These were :

(a) branches of foreign companies will be required to convert themselves into Indian companies ;

(b) branches and companies engaged in manufacturing activities in sophisticated areas in which India did not have indigenous know-how and which were predominantly export-oriented will be allowed to continue on the basis of the existing approvals, subject to Indian participation being not less than 26 per cent of the equity of the company ; and

(c) companies engaged in trading activities or in manufacturing activity will be required to bring down their foreign holding to 40 per cent.

Though some units had paid not much attention to the FERA guidelines, quite a number of units, including MICO, Philips, Bayer, India Aluminium and Associated Bearings, reduced foreign holdings as a result of expansion and diversification of business. Some companies including Brooke Bond, Hindustan Lever, Metal Box and General Electric are in the process of diluting the share holding by diversification of business. During the last three years, about 33 foreign-owned companies entered the capital market through the process of additional equity issue or disinvestment of share held by the parent companies. Some companies diluted the foreign holding by merger.

Government Policy

The policy of the government is to ensure that operations of foreign companies as also that of indigenous concerns conform to the overall socio-economic policy of the country and their activities including their size of operations are regulated within the policy guidelines announced by the government from time to time All foreign companies are also subject to the discipline of industrial licensing even in areas where exemptions are available to other categories of industries. Cases of excess production are being brought before the licensing committee for a decision on a case by case basis In cases where it is established that the capacity installed by the company was more than licensed capacity and this resulted in production in excess of licensed capacity, suitable action will be taken as permissible under the law.

I may have thought the road to a world of free and happy human beings shorter than it is proving to be, but I was not wrong in thinking that such a world is possible, and that it is worthwhile to live with a view to bringing it nearer.

—Bertrand Russell

Towards Abolition of Untouchability

THE CONSTITUTION of India ensures every citizen justice—social, economic and political, liberty of thought, expression, belief, faith and worship and equality of status and opportunity. It aims to promote among the citizens fraternity assuring the dignity of the individual and the unity of the nation.

In realisation of these noble goals, the practice of untouchability was prohibited. Article 17 of the Constitution says "Untouchability is abolished and its practice in any form is forbidden." The enforcement of any disability arising out of 'Untouchability' shall be an offence punishable in accordance with law. Article 15(2) prohibits the discrimination in the use of public utilities on the grounds of religion, race, caste etc. It states that no citizen shall, on grounds of religion, race, caste, sex, creed, place of birth or any of them, be subject to any disability, liability, restriction or condition with regard to (a) access to shops, public restaurants, hotels and places of entertainment, or (b) the use of wells, tanks, bathing ghats, roads and places of public resort maintained wholly or partly out of the state funds or dedicated to the use of the general public.

The Constitution also prohibits discrimination on the ground of caste in matters of public employment. Article 16(2) lays down that no citizen shall on the grounds of religion, race, caste, sex, descent, place of birth, residence or any of them, be ineligible for or discriminated against in respect of any employment or office under the State.

Article 338 of the Constitution provides for the appointment of a special officer for the scheduled castes and scheduled tribes who is to investigate all matters relating to the constitutional safeguard Article 340 also provides for the appointment of a commission to investigate the conditions of socially and educationally backward classes.

Mahatma Gandhi's Role

Apart from these constitutional provisions for the protection of the interests of the backward classes, there have been many social reformers like Swami Vivekananda, Raja Ram Mohun Roy, Dayanand Saraswati, Rabindranath Tagore and Mahatma Gandhi who did yeomen work for the cause of these socially backward people.

Mahatma Gandhi was the champion of the cause of these people. It was he who first used the word "Harijan" for the scheduled castes. Instead of calling them "untouchables", he called them "men of God".

Mahatma Gandhi did pioneering work for the upliftment of these people. He campaigned unceasingly against untouchability through the press and platform. Through his weekly *Harijan*, he tried to educate the people so that the practice of untouchability might be removed from the soil of India. Gandhiji asked the so-called caste Hindus to clean latrines and himself undertook the task on many occasions so that the stigma could be removed from the Harijans who had to perform this task. He even adopted a Harijan girl as his daughter and lived in Harijan quarters on his tours. In Delhi, the bhangi colony was his temporary headquarters.

In addition to abolishing untouchability, Article 17 of the Constitution also prescribed that Parliament would make such offences punishable as might involve enforcement of disabilities connected with untouchability. Accordingly, the Untouchability (Offences) Act was enacted on 8 May 1955 prescribing punishment for the practice of untouchability. This Act provides penalties for preventing a person, on grounds of untouchability, from entering a place of public worship and offering prayers or taking water from a sacred well or spring. Penalties are also provided for enforcing any kind of social disability such as denying access to any shop, restaurant, public hospitals or educational institution, hotel or any place of public entertainment; or denying the use of any road, river, well, tank, watertap, bathing ghat, cremation ground, sanitary convenience, *dharmashala, sarai* or *musafirkhana* or utensils kept in such institutions and hotels and restaurants. The Act prescribes penalties for enforcing occupational, professional or trade disabilities, or disabilities in the matter of enjoyment of any benefit under a charitable trust, in the construction or occupation of any residential premises in any locality or in the observance of any social or religious usages or ceremony.

The Act also lays down penalties for refusal to sell goods or render services to a person on the ground of untouchability; for molesting, injuring or annoying a person, or organising a boycott of, or taking any part in the ex-communication of a person who has exercised the rights accruing to him as a result of the abolition of untouchability.

Higher penalties have been prescribed for subsequent offences For purposes of awarding punishment, incitement or abetment of the offence is treated in the same manner as the commission of the offence. The offences under this Act are cognisable and the onus of proving innocence is on the accused

Elayaperumal Committee

Ever since the Act came into force, there was criticism about the effectiveness of the Act. The Commissioner for Scheduled Castes and Scheduled Tribes also pointed out that the punishments awarded under the Act were too few and too inadequate. In view of this criticism, the Government appointed a Committee on Untouchability and Economic Development of the Scheduled Castes under the Chairmanship of Shri L. Elayaperumal in 1965, which was asked to make recommendations for amending the Act. In its Report submitted in 1969, the Committee noted the inadequate and ineffective enforcement of the Act. The offences were committed with impunity. More often than not, the victims of the practice of untouchability would not lodge complaint for fear of social reprisal and deterrent economic consequences. The Harijans would be beaten up, their children given blows and women assaulted. The landlords, money-lenders and rural oligarchs would not give them work on full wages, or just not give them work and resort to their boycott to bring them under their socio-economic subordination. The Committee recommended the establishment of an enforcement machinery, and made proposals for plugging the loopholes and lacunae in the statutory provisions.

In pursuance of its declared policy, the Government of India decided to implement the recommendations of the Elayaperumal Committee. Accordingly, the previous Act was amended comprehensively by the Untouchability (Offences) Amendment and Miscel-

laneous Provision Act, 1976. Where the minimum term of imprisonment does not exceed three months, the offences are triable summarily. Direct or indirect preaching of untouchability or its justification on the historical, philosophical, religious or traditional grounds has been made an offence. Privately owned places of worship allowed by the owner to be used as places of public worship have been brought within the purview of the law. There is a provision for imposition of collective fines on the inhabitants of any area where such inhabitants are concerned in or have abetted the commission of untouchability offences. Persons convicted of untouchability offences have been debarred from contesting election to the central and state legislatures. Public servants who wilfully neglect the investigation of any offence punishable under the Act are deemed to be abettors.

Directions to the States

Section 15 of the Act lists out measures for the effective implementation of various provisions of the Act. It also provides for the central government to take such steps as may be necessary to coordinate the measures taken by the state governments.

One of the special features of the Act is that special responsibility has been placed on the state governments to ensure that the rights accruing from the abolition of untouchability are made available to, and are availed of by, the persons subjected to any disability. In sub-section (2) of section 15A of this Act, the state governments have been asked to take the following measures :

- (i) the provision of adequate facilities including legal aid to persons subjected to any disability arising out of "untouchability" to enable them to avail themselves of such rights;
- (ii) the appointment of officers for initiating or exercising supervision over prosecutions for the contravention of the provisions of this Act;
- (iii) the setting up of special courts for the trial of offences under this Act;
- (iv) the setting up of committees at such appropriate levels as the state government may think fit to assist the state government in formulating or implementing such measures ;
- (v) provision for a periodic survey of the working of the provisions of this Act with a view to suggesting measures for the better implementation of the provisions of this Act ;
- (vi) the identification of the areas where persons are under any disability arising out of "untouchability" and adoption of such measures as would ensure the removal of such disability from such areas.

Some states have already taken steps for the implementation of the above measures. The progress made in these fields is mentioned below :

The state governments of Andhra Pradesh, Bihar, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan and Uttar Pradesh have initiated several schemes for the grant of legal aid to the scheduled castes in certain types of civil and criminal cases, including the untouchability offences. For this purpose, a means test has been prescribed as an eligibility criterion for availing legal aid.

The state governments of Andhra Pradesh, Bihar, Gujarat, Karnataka, Kerala, Madhya Pradesh, Orissa, Punjab, Rajasthan, Tamil Nadu and Uttar Pradesh have set up special cells at different levels to supervise the implementation of the Protection of Civil Rights Act. The government of Haryana has ensured that prosecution for the contravention of the Act is to be conducted under the personal supervision of the district attorney. The government of Maharashtra has directed the Inspector General of Police, Bombay, to establish local crime units at district levels empowering them to register and investigate offences against scheduled castes.

Special Courts

The government of Gujarat is setting up mobile courts in selected areas for speedy disposal of untouchability cases.

Advisory/review/implementation committees at different levels have been set up by the state governments of Andhra Pradesh, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Rajasthan and Tamil Nadu.

The governments of Andhra Pradesh and Haryana have entrusted the work of periodic survey to district level committees. The government of Gujarat has proposed to carry out surveys through social research institutes, universities and government agencies like the Bureau of Economics and Statistics and the Directorate of Social Welfare. The Orissa government has entrusted this work to the Harijan welfare advisory boards at sub-divisional levels.

The Andhra Pradesh government has a proposal to give suitable incentives/awards for furnishing information on the existence of untouchability in appropriate cases. The Gujarat government has entrusted district vigilance committees and social justice committees of the district panchayats to do the work of identification of areas. In Haryana, the district-level committees will undertake this work. The Orissa government has asked the sub-divisional level committees to perform this task. In Tamil Nadu, the state government in consultation with the Inspector General of Police will identify the areas.

The Janata Party, in a meeting of its Members of Parliament belonging to scheduled castes and scheduled tribes held in New Delhi on 16 September 1977, decided to set up "vigilance committees" both at the central and the state levels to prevent ill-treatment of Harijans and tribal people. The committees would rush to the spots of reported atrocities and ill-treatment to any such person, make an "on-the-spot" survey of the situation and if necessary, recommend to the central or the state government immediate remedial measures

Prime Minister's Letter

In a letter to the state chief ministers in September this year, the prime minister, Shri Morarji Desai, pointed out that the use of force by landlords to grab Harijan lands be made a cognisable offence to enable the police to intervene directly. He noted that while the use of force to grab land was culpable, violent attacks on Harijans for the purpose were reprehensible

Along with his letter, Shri Desai also sent to the chief ministers the guidelines issued by the Orissa government to its district authorities in this regard for their consideration Under these guidelines, it would be the responsibility of collectors and superintendents of police to take prompt action in respect of incidents where Harijans had been subjected to violence or intimidation.

They should ensure that the incident is immediately inquired into by a specially designated officer not below

the rank of deputy superintendent of police or a deputy collector. This officer should submit his report without delay.

Other suggestions made to prevent harassment of Harijans in an effective manner are :

(i) periodical drives to be launched to reassure the scheduled castes and other weaker sections that their rights will be protected ;

(ii) areas where recrudescence of such instances of harassment is likely to occur should be identified and adequate preventive measures taken ;

(iii) offences involving violation of civil rights on account of caste considerations should be investigated as special report cases and entrusted to specially-designated officers ;

(iv) Prosecutions in such cases should be swiftly launched ;

(v) victims of serious atrocities should be given immediate relief and procedural difficulties should be promptly remedied ;

(vi) imposition of collective fines under the provisions of the protection of civil rights act should be considered in cases where such instances have occurred more than once ;

(vii) legal assistance to the members of the scheduled castes and scheduled tribes should be provided for their defence ; and

(viii) Non-official agencies should be suitably mobilised in this task of providing protection to Harijans and weaker sections of society. □

STRONG YES, BRUTAL NO

I hope that our nation, much less my humble self, will never be brutalised because it is a strange idea that one can only be strong by being brutal. I reject that idea completely. Our strength lies in other factors. Brutality is a thing which we have associated with certain movements which we have objected to or rejected. By becoming brutal and thinking in those brutal ways we lose our souls and that will be a tremendous loss I hope that India, which is essentially a gentle and peace-loving country, will retain that mind even though it may have to carry on war, with all its consequences to the utmost.

There is a definite distinction between strong and being brutalised. I need not mention an instance which has lent prestige to our history—the instance of the long period when Gandhiji was controlling the destinies of our movement for freedom No man can say that Gandhiji was brutal. He was the essence of humility and of peace. No man can say that Gandhiji was weak. He was the strongest man that India or any country has produced. It was that peculiar mixture of strength with sacrifice to the uttermost, yet a certain humility in utterance and a certain friendly approach even to our opponents and enemies, that made him what he was. Those of us who were privileged to serve with him and under him do not, of course, claim to be better than him. We are humble folk who cannot be compared with the truly great, but something of the lesson that he taught came down upon us and we learnt it in a small measure. In the measure we learnt it, we also became strong though, I hope, not brutal. So I would like to stress that I do not want to become brutal ; I do not want that aspect of the cold war and the hot war which leads to hatred and dislike of a whole people and to looking upon them as something below normal.

—**Jawaharlal Nehru**

State Farms Corporation

THE STATE Farms Corporation of India Ltd. (SFCI) was set up in May 1969. To begin with, the Corporation acquired from the Government of India five farms—the state farms at Suratgarh and Jetsar (in Rajasthan) Jharsuguda (Orissa). Jullundur (Punjab) and Hissar (Haryana). At present it is engaged in the development of 12 farms.

The Corporation has an authorised capital of Rs. 7 crore. During the first year of its establishment, equity shares of the value of Rs. 1 crore were issued. Against this an amount of Rs. 62,32,668 was received from the Government of India. The Corporation also borrowed a sum of Rs. 25 lakh from the government. In the first year it earned a net profit of Rs. 27.84 lakh and in 1973-74 the profit reached Rs. 109.00 lakh. However, the Corporation showed losses during 1974-75 and 1975-76. The loss was mainly on account of fall in prices of seeds. Prices were lowered to make available quality seeds to the farmers at reasonable prices

It is a well known fact that India is a land of small farmers with land ownership seldom exceeding a few acres. However, certain objectives, such as the production of high quality disease-free seeds, can be better realised on large farms. The Corporation was set up with two major objectives : (i) production of seeds of various crops, and (ii) reclamation of waste land. Apart from this, the Corporation engages itself in production of foodgrains, fibre crops, plantation crops, oilseeds, fruits and vegetables.

Its 12 farms now command a total area of 109,000 acres.

In respect of production of seeds, the Corporation is satisfying an important need with its farms located in different states with different agro-climatic conditions. Sometimes the seeds have to be produced out of season. There is thus need for an all-India production agency.

MECHANISATION OF FARM OPERATIONS

As a result of research, new equipment is being produced to carry out the various farm operations more efficiently and cheaply. Small farms are not able to use much of the new equipment for economic reasons , only large units are capable of introducing the latest technology. Aerial spraying of crops with urea and mechanisation of potato cultivataion is possible only on large farms. The SFCI has thus an important role to play in mechanisation of farming in the country.

The importance of training in farm management is being increasingly recognised. The agricultural universities impart theoretical training in this field. For practical training one has to turn to large farms like the ones under the SFCI. The Corporation imparts practical training and it also has the capacity to absorb qualified persons. It can maintain a cadre of highly skilled farm managers.

The Corporation is expected to provide the major base for the future seed industry in India. This is because it is already in the process of developing big farms for the purpose of quality seed production in compact areas, thereby minimising the costs on quality checks, processing, cleaning and storage. Locations already under consideration for developing them into seed farms are Suratgarh, Sardargarh and Jetsar in Rajasthan, Hissar in Haryana, Ladhowal in Punjab, Bahraich in Uttar Pradesh, Raichur in Karnataka, Chengam in Tamil Nadu and Aralam in Kerala.

(Contd. on page 24)

Planning for Men or Things?

C. BAL KRISHNA, writing in the *Indian Express* has drawn attention to the weaknesses of mechanistic planning. For instance, the farm—not the farmer—has been usually the focus of attention Similarly, tribal people are often uprooted from their scattered but nicely-located hutments on the hills in a misguided notion of bringing these people into the mainstream of national development. They are asked to move to well-planned colonies, but all that the tribal people want is to improve the houses they live in.

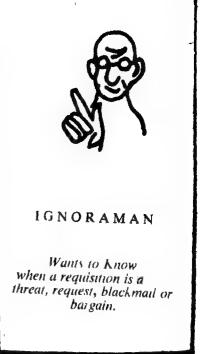
With the best of intentions, government offers them loans for building *pucca* houses, but forgets that cement cannot be transported, as approach roads even for cycling just do not exist. And since the planners often assume that they know what is good for the people, they refuse, it seems, loans to the tribal people for improving their houses using locally available material

Bal Krishna says the plan documents assume human beings as mere cogs in a wheel "The problem of human resources formation and development is by and large neglected in most developing countries with the possible exception of a few countries like Tanzania where the concept of Ujaama village does not ignore this aspect."

To this neglect of men and emphasis on "things" is to be traced the decline in the ratio of allocation for primary education The contingency expenditure on stationery and other items, it seems, is not allowed to exceed one rupee fifty paise a month even for primary schools with a strength of 100 students in the villages of Udaipur district. (Of course, the allocations are higher in towns! One is reminded of Krishna Menon's barb aimed at a pompous British delegate defending in a UN Committee the higher allocation for an English student than for an African in colonial Kenya The tartar in Krishna Menon could not resist hitting back, "Naturally an African child can learn more and with far less than an English child")

THERE ARE still fossils in Yojana Bhavan hidden behind the technological mask who say with Dr M S. Swaminathan that questions of formal literacy can be bypassed by TV, SITE and the rest Debunking the modern-looking antediluvins, Bal Krishna speaks of the immense harm of reliance on such "wonder substitutes" for formal or non-formal literacy programmes. Short-cuts will only dilute the already meagre resources for bringing the teacher and the taught face to face (which even the TV cannot do)

What a travesty of planning that, in a country where large numbers of educated youth are groping for a worthwhile purpose, we think still of TV and SITE for education! The other aspect pertinently mentioned by Bal Krishna is that the teacher, through TV or SITE, may have no means of learning from the millions of "illiterates" who have an abundance of wisdom Somalia and Tanzania have understood the significance of this fascinating encounter between the illiterate and the literate, between sense and nonsense Such an encounter will not only check the rural-urban migration, as pointed out by Bal Krishna, but bridge the cultural gap between the villages and the towns

The Soviet Union, China and Cuba on the one extreme, South Korea on the other extreme and Tanzania in between have found ways, largely traditional, of simultaneously tackling the problems of illiteracy and rural backwardness There is, of course, one problem in India. Our villages are not homogeneous social entities—a fact ignored by the CD programme based on a wrong assumption of a village community which simply does not exist. Each village is a community of communities. Bal Krishna refers to the fact that a village is often controlled by the money-lender, the big landlord and four or five others A purely economic programme depending primarily on better technology cannot bring about any kind of justice—distributive or social


IGNORAMAN

Wants to Know when a requisition is a threat, request, blackmail or bargain.

DO OUR planners, while allocating funds, ever think of setting apart ten or even five per cent of the outlays on programmes to raise the level of conciousness of the people? Why not as much as even Rs 10,000 crore on what is clearly the basis of democratic development? Such an approach will certainly enlarge the employment base, the cultural base and the base of resistance to rural oligarchy The bloodsucking urban process can be reversed only by a massive investment in village school, village communication and the like

When we speak of rural schools, we suddenly hear of "pseudo" revolutionary ideas of open schooling, whereas the city-bred should have the most modern structures. Not that anyone is pleading for extending to the villages the ugly monsters of urban construction. But we cannot say a village does not need some kind of a school building and children can read under a tree This would probably have been eminently acceptable, if the entire social structure conforms to ancient teacher-disciple system. What we are today faced with is a wholly disproportionate expenditure on facilities in towns and next to no spending in villages on social services The result is that a pampered urban class can hold the entire country to ransom

Bal Krishna has written about the pitiable condition of primary schools in villages where, apart from poor accommodation, one teacher has to look after one hundred children, besides being the watchman, administrator etc. Even a black board is a rare sight in the class room.

The problem of our planners is that they always think in terms of a direct relationship between a facility and its consequence. In the case of a village school, the end is not merely literacy or education. The end is much bigger. The school is a centre of village deve-

lopment, it is a catalyst for raising the level of consciousness of the people, it is an instrument for breaking caste and other barriers, it is a way of using dedicated youth for a worthwhile cause. Therefore, one has to think not only of a good school building, harmonious to the environment, of good teachers (not necessarily highly paid) of good and frequent training, of maintenance, of a village reading room, of a village policeman who will serve under the village head-master, of village postal, telegraph and telephone facilities, of dormitories for children, of new curricula based on Gandhiji's ideas, of clothing and feeding the students, of giving them learning aids and of stipends to parents. The school, as Bal Krishna points out, is also a centre of political, civil and social education.

RURAL INDUSTRIES can wait, not rural schools, rural communication and rural roads. Nor should one engage in a controversy over formal or non-formal education. From schooling to de-schooling, from communication to anti-communication, from aided help to self-help, from self-interest to collective interest and then to no interest, from law and order to self-government. For all this the starting point is the village school.

Bal Krishna's article could not have ended more appropriately than with the following quotation from Gandhiji :

> **"The village movement is as much an education of the city people as of the villagers. Workers drawn from cities have to develop village mentality and learn the art of living after the manner of villagers."**
>
> **"This does not mean that they have to starve like the villagers. But it does mean that there must be a radical change in the old style of life."**
>
> **"While the standard of living in the village must be raised, the city standard has to undergo considerable revision without the worker being required in any way to adopt a mode of life that would impair his health."**

Sanjaya

GANDHI MAHARAJ

We who follow Gandhi Maharaj's lead
Have one thing in common among us
We never fill our purses with spoils from the poor
Nor bend our knees to the rich.

When they come bullying us
With raised fist and menacing stick
We smile to them and say :
Your reddening stare
May startle babies out of sleep
But how frighten those who refuse to fear ?

Our speeches are straight and simple,
No diplomatic turns to twist their meaning :
Confounding penal code
They guide with perfect ease the pilgrims
To the border of jail
And when these crowd the path to the prison gate
Their stains of insult are washed clean,
Their age-long shackles drop to the dust
And on their forehead are stamped
Gandhiji's blessings.

RABINDRANATH TAGORE

15-2-1940

STATE FARMS

(*Contd. from page* 21)

The total demand of seed in 1980-81 would be 2,14,500 tonnes The Corporation is expected to contribute 1,00,680 tonnes of seed under the National Seed Project which comes to 46 9 per cent of the total demand.

Brief Notes on State Farms

The Suratgarh farm is located deep into the Thar desert where green revolution has taken place. Launched in 1956, it is a symbol of Indo-Russian friendship and co-operation. The farm has an area of 27,494 acres. During the year 1975-76, kharif and rabi production reached 53,297 and 1,39,985 quintals Its major crops are wheat, paddy and gram. Net profit of the farm during 1975-76 was Rs. 30.84 lakh This is the only farm which showed profit during 1975-76.

The Jetsar farm also shows how, given proper inputs and modern technology, deserts can be made to bloom. The farm was started in 1964 and has an area of 13,316 acres. Its major crops are wheat, cotton, gram, and cotton.

The Hissar farm furnishes an example of what can be achieved through reclamation of waste land. The farm was started in 1968 and has an area of 6912 acres. The major crops are wheat, cotton, gram, and bajra

The Ladhowal came into being in 1971 and has an area of 2 921 acres. Its major crops are wheat, paddy, maize and potatoes.

The Rae Bareli farm shows how the sick saline and alkaline lands can be brought back to life The farm was started in 1973 and has an area of 471 acres Its major crop is paddy.

The Bahraich farm is a multi-purpose farm with plans for diversified farming, including crop production, fisheries, sheep rearing and cattle breeding The farm was started in 1973 and has an area of 5,700 acres Its major crops are wheat, paddy and vegetables, etc

The Raichur farm is located in the cotton growing belt in a backward area of Karnataka and is becoming the hub of cotton development work, particularly the Varalaxmi variety The farm, started in 1969, has an area of 7,310 acres. Its major crops are cotton and jowar

The Khammam farm is also located in one of the backward areas and will undoubtedly be instrumental in taking the green revolution to this part of Andhra Pradesh The farm was established in 1972-73 and has an area of 2,428 hectares

The Chengam farm is well-known for raising dry land crops The farm, established in 1971, has an area of 9,648 acres. Its major crops are maize, groundnut and vegetables.

The mizoram farm demonstrates to the Mizos how to increase agricultural production through modern agricultural practices.

The Kokilabari farm is also fulfilling the same purpose in agriculturally backward areas of Assam The farm, started in 1971, has an area of 4,906 acres Its major crops are paddy, wheat and potatoes

The Aralam farm, set in picturesque surroundings is engaged in developing plantation crops like pineapple, coconut, cashew nuts and cocoa. The farm was started in 1970, and it has an area of 7,559 acres.

Textile Mills Versus Handlooms

SULTAN SHAHIN

THE HOME MINISTER's suggestion that the output of textile mills be earmarked for export and the home demand be fulfilled by handlooms has been criticised by certain sections as "hare-brained". On the other hand Shri Charan Singh's idea may help generate sixty lakh jobs immediately. This alone should have qualified the idea for serious consideration, if not unanimous approval.

The textile lobby, however, seems to be active to strip the poor to the skin. Prices of cloth have risen by as much as 83 per cent since 1972. The per capita cloth consumption has consequently been going down steadily. The controlled cloth scheme introduced in 1964 has not achieved its objective. Cheap cloth consumed by the common man is seldom available in the market. And all these years, the Congress government had been shouting that India is the third largest exporter of cotton textiles, that it ranks first in installed capacity and that our mills produce as many as 3,000 varieties of fabrics.

The mill sector shares about half of the 8,000 million metres of cloth produced every year. The remaining half is produced by the decentralised sector of which handlooms produced 2,330 million metres of cotton cloth in 1976, besides weaving almost all the silk fabrics of the country. The powerlooms produced about 1,100 million metres. The parity between the mills and the decentralised sector, however, ends here. As far as the employment potential is concerned the mills provide direct employment to only about nine lakh people and indirect employment to a few lakhs more—the people who are engaged in cotton cultivation, ginning and processing of cotton, cottonseed crushing and marketing. On the other hand, the handlooms provide direct employment to as many as one crore people who are running 35 lakh cotton handlooms and about 3 lakh silk, art silk and woollen handlooms. The quantum of cloth generally prepared by 12 handloom workers is equal to what is prepared by one textile worker. Obviously, handlooms are much more labour-intensive than the mills and yet they have received little encouragement from the Government.

Problems of the Handloom Sector

A comparative study of the gigantic problems the handloom industry has to face and the patronage the mills have all along received are quite revealing. Every now and then the weavers clamour, unsuccessfully of course, for adequate and timely supply of yarn, dyes and chemicals, at reasonable prices. A high-powered Study Team on the problems of handloom industry set up by the Government of India in July, 1974 found out that "As far as composite mills are concerned, the handloom sector can rely on the supply of yarn only to the extent that it is surplus to the requirements of the mills. These mills first utilise yarn in order to meet their requirements in full and make supplies to the handloom sector only out of surpluses, if any". Moreover, constantly plagued by the fear that their product may not be sold, handlooms are compelled to market their products largely near the centres of production, whereas the products of the organised sector, find their way to all parts of the country. The recommendation of the Study Team that modernisation of handlooms should be undertaken is still lying in the cold storage.

In almost all States, there is a complete lack of infrastructure for distribution of yarn and for providing credit to the weavers. No suitable programme has so far been evolved for training the weavers in order to improve their efficiency. While loud protestations have been continually made for giving the weaver a fair deal, his artistry and sophistication have remained utterly unmatched by any effort to effectively organise production and marketing in his best interests. While a few states had initiated measures for improving the condition of weavers, there has never been any nationally directed programme for development of this sector.

Huge Profits by the Mill Sector

On the other hand, the mill sector has enjoyed all possible privileges to enrich itself at the cost of the nation. The huge profits this sector earns is common knowledge. A study of the 249 cotton textile companies made by the Textile Commissioner showed that their net profit rose from Rs. 11.04 crore in 1971-72 to Rs. 31.34 crore in 1972-73. A similar study of 223 mills revealed that their net profits jumped to Rs. 63.55 crore in 1973-74. Seven other mills made profits ranging between 50 to 300 per cent in 1973 over their gains in 1971. These figures are based on their balance-sheets. Knowledgeable sources believe that the balance sheet figures are illusory and the actual profits are much more than that. Similarly total exports of the textile industry rose to Rs 500 crore in 1976-77 from Rs. 296 crore in 1974-75. The per unit export realisation went up to Rs. 3.41 per square metre in 1974 from Rs. 2.81 per square metre in 1973. From about Rs. 5.50 per kg. in 1966, the unit value realisation on cotton yarn jumped to as much as Rs. 16.15 per kg. in 1975. Exports of apparel rose from Rs 30 crore in 1972-73 to Rs. 95 crore in 1973-74 and to Rs. 184 crore in 1975-76.

Over and above these huge profits, this industry has been benefitting greatly from all sorts of government largesse extended to it from time to time. Imports of polyester fibre, for instance, have been decanalised and placed on the free-licensing system. Imports of cellulosic staple and polynosic fibre have been permitted free of duty and placed on Open General License from July 24, 1976 to October 31, 1977. The Government is spending Rs. 25 crore from the public exchequer to supply the industry with imported cotton.

In spite of all this, the industry has remained firm in its determination to thwart every attempt to clothe the poor. When the controlled cloth scheme was introduced in 1964, and the share of the controlled cloth to the total cloth output was fixed at 50 per cent, the powerful textile lobby lost no time to put its weight against the measure. It pressurised the then Government to reduce the share of the controlled cloth to 40 per cent. Not satisfied with this the industry started producing controlled cloth of such a poor quality that few people wanted to buy it. The consequent lack of interest was exploided by the lobby to prove that there was no genuine demand for controlled

cloth in the country. The following year the common man's share was further reduced to 25 per cent and later on to as little as 10 per cent. To add insult to injury, the textile, industry has been claiming that it incurs an annual loss of Rs. 80 to 90 crore on account of being compelled to produce controlled cloth. What is worse, the Congress Government took their agitation much too seriously. The price of controlled cloth was raised as many as six times and the quantity of broad varieties of controlled cloth to be produced by mills was reduced still further. It was decided that production of controlled saris and dhotis would be entrusted to the handloom sector and the mills could get the remaining controlled varieties through the powerloom sector.

Deliberate Sickness

The textile industry has, indeed been leaving no avenue unexplored for cheating large funds out of public exchequer. They keep running their obsolete machinery for as long as possible without making any effort to modernise it. Once it becomes absolutely useless they declare it 'sick', banking on the belief that, cloth being a basic need of the people, the Government will surely come to their rescue. This racket has been going on for decades. So far the National Textile Corporation has had to take over 103 sick units from the private sector.

This state of affairs amounts to a gigantic fraud on the people. The huge profits—varying from 50 to 300 per cent—that the textile industry has been earning has been invested in other more profitable indus'ries like electronics, chemicals and engineering while legitimately they should have been invested in improving the health and productivity of the textile industry itself. During the entire fourth plan period, the actual expenditure on modernisation was a paltry Rs 15 crore against the recommended minimum of Rs 375 crore. A World Bank team described the majority of cotton textile mills as 'industrial slums'. The team felt that the productivity of even the worst mills could be improved by updating and reconditioning the machinery to give 80 to 90 per cent of the performance of new machinery at 40 per cent of the cost of new machinery.

According to a study conducted by the National Productivity Council (N.P.C.), the industry is losing 184 million kg. of cotton and 182 million kg. cloth per annum on account of economically inefficient and technically obsolete machinery. Giving details the N.P.C. report says that while 60 per cent of the total installed capacity is more than 30 years old, another 20 per cent of the capacity is weak. This apart, over the last 18 years, the industry has not been able to utilise its installed capacity to more than 73 per cent in the case of looms. So much for our having the largest installed capacity in the world.

Clearly the textile mills sector needs a vigorous shakeup. The new Government will have to deal firmly with the monopoly houses which have been thriving at the cost of the poor. The situation also calls for large-scale efforts to develop the handloom industry. The difficulties of the weavers in getting adequate and timely supply to meet their essential requirements as well as in marketing their products in an organised way should be removed forthwith. A Raw Materials Bank could be set up to ensure a continuous and timely supply of yarn, dyes and chemicals at reasonable rates.

But here again the government will have to be cautious. At the moment while certain range of handloom products are available to the lowest income groups of the community, there are fabrics at the other end of the consumer spectrum which are suitable pricewise only for the well-to-do such as the urban elite or for the foreign markets. Indeed, despite the blessings it brings to millions of families in the form of employment, the handloom sector has yet to make any significant impact in meeting the requirements of the large mass of the people in the middle income groups who ask not only for quality but also for durability and reasonable prices. At the same time no effort should be spared to see that the Indian consumer begins to exercise an increasing and conscious preference for the products of the handloom industry. Meanwhile a study team can be set up to go into the various aspects of the suggestion and find out how the switchover can be effected without causing any dislocation in the industry or any harassment to the consumer.

Indian Planning—A Review and Recast

Partha Pratim Mitra

INDIAN PLANNING has been based on a paradigm which looks into economic history. Fundamentally, this paradigm relates development with urbanisation. At least this is how the noted scholar Prof Simon Kuznets puts it in his book 'Economic Growth of Nations'. According to him basic elements of the historical growth experience are the same in the capitalist and the socialist world. Development calls for change of the state of rural and an agro-based underdevelopment to the prominence of an urban industrialised sector. As urbanisation continues, the importance of agricultre in the share of the total national income diminishes. A higher industrial wage rate encourages migration from villages to the newly developed townships and cities. But this does not imply that agriculture is neglected. On the contrary, owing to capital investment average productivity of labour in this sector, shoots up and tends to approach the same level as in industry.

In most countries of Latin America, South and South East Asia and Africa, the above pattern has been accepted as the model for development. But unfortunately, the process of growth is yet to start since the conditions which prevailed in the advanced world during the [illegible] century no longer exist in them.

Our Plan Strategy

The main objective of our five year plans, in particular the second and third plan, has been "development along socialist lines to secure rapid economic growth and expansion of employment, reduction of disparities in income and wealth, prevention of concentration of economic power and creation of the values and attitudes of a free and equal society".

The emphasis in our plan strategy up to now has been to usher in self-reliance by the building up of economic and social overheads, exploration and development of minerals and the promotion of basic industries such as steel, machine

also been felt that the low
rds of living, under-utilisa-
human resources and inequa-
the pattern of income distri-
have been the result of basic
evelopment and over-depen-
on agriculture. Thus rapid
ialisation and diversification
economy has been the basis
development so far.

second five year plan,
hough a continuation of the
pment process initiated dur-
first, has been conspicuous
shift in priorities with a grea-
phasis on industrialisation,
lly the heavy industry. The
nodel has been based on the
of Prof. P. C. Mahalanobis,
is essentially a variant of the
it forward by Prof. Feldman
Soviet Union.

goes without saying that
h a change in strategy of our
mic planning in the second.
1 the third plan, satisfactory
ss has been made on the in-
il front. But unlike the Soviet
this achievement has been at
pense of other sectors.

RRELEVANT COMPARISON

comparison of the conditions
g prior to the commencement
Soviet and the Indian first
shows that the two countries
een standing on a different
g altogether. The per capita
bility of fooodgrains per annum
Soviet Union in 1928, the in-
al year of planning, was about
g. Thus food was never a
aint in Soviet planning. The
problem had been to collect it
he rich farmers (Kulaks) and
ute it at reasonable rates in
dustrial centres and cities. To
this problem, the collectivisa-
movement was launched by the
Government. In 1928, ow-
good crops, grain levies
ited to about 8 million tonnes.
gh during the first plan period,
ltural output in Soviet Union
about 20 per cent Stalin was
o mobilise sufficient quantities
in to feed his workers. Despite
sed food production, food
heap to continue the industria-
n programme.

in India, the position has
quite different. In 1955, the
ear of the second plan, the
pita availability of food grains
aried arround 160 kg per
gure was still lower during the
plan period. Between 1951

been 175 kg. in 1965 and the lowest
153 kg. in 1973. In the remaining
years, the annual availability of
grains has varied around 160 kg.
per head. These figures indicate
amply the difference in the pre-
planning conditions in the Soviet
Union and India. The situation
was comparatively much better in
the former than the latter. Whereas
the heavy industrialisation program-
me of the Soviet Union could be
pursued without undue pressures
on the economy this was not possi-
ble in the case of India. An ana-
lysis of the planning achievements,
will give us an estimate of the
penalty we had to pay for opting
for the heavy industry.

DEFICIT FINANCING

Economic planning called for
rapid mobilisation of financial re-
sources, especially after 1956, when
the emphasis shifted towards indus-
trialisation. To overcome the
absence of a free and smooth flow
of funds into the development pro-
ject there was no alternative but to
resort to the printing press. In the
first plan, deficit financing was
Rs 333 crore or 17 per cent
of the total outlay of Rs. 1960
crore In the second plan the
amount shot up to Rs. 948
crore out of a total plan expendi-
ture of 4600 crores or 20 6 per cent
of the aggregate In the third plan
the figure went up to Rs. 1133
crore out of a total plan outlay of
Rs 8557 crore or 13.2 per cent.
During the 3 annual plans deficit
financing was to the tune of Rs 682
crore which was about 10 per cent
of the total plan expenditure of
Rs. 6756 crore In the fourth plan,
the amount was Rs. 1,203 crore out
of a total of about Rs. 16000
crore The lessons of excessive defi-
cit financing have still not been
learnt even after the crisis of
1973-75.

The cumulative rise in deficit
financing over the years, has been
mainly due to the fact that the gov-
ernment spending has been in excess
of the revenue earnings. As the
extra expenditure is not backed by
adequate supply of goods that
deficit financing has led to inflation.
And when, prices start rising,
the general cost of production is
pushed up and a larger supply
of funds is needed to conti-
nue development work, which in a
poor country like India can be had
mainly through deficit financing.

Thus the vicious circle goes on,
for example after a 16 per cent fall
was 30 per cent rise at the begin-
ning of the second plan with 1939
as the base year. The inflationary
pressures which made their appear-
ance during this period have
stayed with us right through with
short interruptions. The third plan
witnessed a price rise of 46 per cent
with 1960-61 as the base year. The
fourth plan started on a note of
caution but as old habits die hard
unwarranted fiscal practices on the
part of the government culminated
in the crisis of the early 1970s
when in a single year a 30 per cent
price rise was recorded. Even
though fiscal discipline was enforced
during the emergency, between
March 1976 and February 1977,
the prices rose by 12.5 per cent.

With inflation challenging the en-
tire planning process, it is difficult
to achieve social justice and eradi-
cate poverty. A general measure to
estimate the two is the level of an-
nual per capita real income, which
is again dependent on the level of
prices. During the decade ending
1960-61, this income had risen at an
annual compound rate of about 1.7
per cent. One expected the percent-
age to rise still further with planning
gaining in experience and sophisti-
cation in the next decade. But it has
been quite the converse. The annual
per capita real income instead of
rising has fallen sharply to 0.8 per
cent (compound) which is even less
than half of the 1950s. Even after
30 years of independence more than
one-third of our population lives
below the poverty line. Such sorry
results have raised doubts about the
efficacy of planning to eradicate
poverty.

FALLING INVESTMENT

Despite mounting investment in
successive five year plans the level
in real terms has been inadequate to
fight unemployment A prohibitive
cost structure has forced the govern-
ment and many an enterprising
entrepreneur to curtail productive
ventures which would have generat-
ed employment and raised the aggre-
gate level of production. A rapid
growth of population is also respon-
sible for this state of affairs, to a
certain extent. But if the cost of
production had not been high and
prices had been relatively stable
much of our economic evils would
have disappeared and the employ-
ment picture would have been
much brighter.

According to Shri V. M. Dande-
kar in 1972-73, of the 240 million
comprising the labour force, 30 per

cent (72 million) did not have any stable means of livelihood. Out of this 72 million, about 30 million were casual workers while 4 million were jobless. Even assuming that about half of the 30 million had some way to earn a living, even then the unemployment figure stood at 19 million—a force to reckon with.

Among the many plan objectives, industrialisation alone has made outstanding progress. During the years of planning, our national income on an average has gone up by 3.5 per cent in which the percentage increase in agricultural production is 2.8 whereas that of industry stands at 6.1. Not many industrial countries exceed this pace. But this achievement as already pointed out has cost us rather dearly in resources, production, employment and income.

The old centralised and heavy industry biased model of development has thus become a curse for the future of the Indian economy. It is imperative that we formulate a more popular down-to-earth integrated rural-oriented decentralised production structure. Development in the words of Mahatma Gandhi should be 'not only for the masses but also by the masses'. Without the wholehearted support of the public, nothing can succeed and the only way to bring success in economic planning is to make rural India, the centre of development.

Moreover the twin problems of unemployment and poverty have their origin in the countryside where about 70 per cent of our population live. The Bhagwati Committee on unemployment in its report submitted to the government in May 1973 observed that out of the 18.7 M unemployed, 16.1 M (86 per cent) came from rural areas and only 2.6 M from urban centres. On the other hand it is expected that out of the 200 M increase in rural population in our country at the turn of the century, a good percentage will be below the minimum living standards. These estimates predict a future which is not too bright for us.

Need for Rural-based Planning

Agriculture is the chief means of livelihood in the rural areas and 60 per cent of our national income is generated in the villages. It is, however, strange to note that in all these years of planning such stepmotherly treatment has been given to agriculture. Of the total plan outlay the share of agriculture, community development, irrigation and flood control during the first pain was 32 per cent, second plan 22 per cent, third plan 20 per cent fourth plan 24 per cent and fifth plan about 20 per cent.

The Janata Government has decided to give agriculture its rightful place in Indian planning, so that benefits percolate in the villages where majority of the people live.

Undoubtedly, decentralisation of the production process will be the main theme. But the method of approach to this new strategy is very important. Faulty techniques and wrong methodology have been the main drawbacks of our past planning mechanism. Hence one will have to think twice before deciding on the mode to implement the process of decentralisation.

District Planning Boards

As the district as a unit of planning is large enough for a well integrated plan strategy, district planning should be the focal point for all planning. The main purpose of district planning is to channelise all available resources for the needs of the local population on a set priority best suited for them.

Such a method of planning will bring about the much needed change in our economic policy and open a new chapter in Yojana Bhavan. Intensive rather than extensive planning would be the order of the day. This will imply a thorough search for undiscovered mineral deposits, harnessing of rivers and waterways, exploitation of sub-soil water resources and in general all that has to be included for the provision of an infrastructure to facilitate economic growth.

This type of decentralised planning will also accelerate the march towards the attainment of Mahatma Gandhi's cherished objective- - *Poorna Swaraj* (total independence), which implies not only political independence but also freedom from poverty and ignorance.

But the entire process of district planning will hold good subject to one condition. It must receive the much needed support and guidance of the state. Within this framework free interaction of market forces should be allowed to play with certain reservations. The state must see to it that a market morphology which ensures free competition does not benefit a particular section of the society leading to exploitation and class conflicts. So long as these reservations are made a free interplay of market forces will bring about economic efficiency and a more optimum utilisation of resources.

Now, how is district planning to be implemented. Best thin[g] be for each district to have [a] planning board. The com[position] of this board is very crucial to be formed in such a way is conducive to grass-root p[lanning]. All sections of the society get a representative on the so that the real problems society get highlighted. The [mem]bers of the board should be by the people and the gov[ernment] could reserve a few seats f[or] weaker sections.

This planning board sho[uld be] responsible for all the devel[opment] activities that take place [in the] district. It will work hand [in hand] with the local administrati[on to] solve the economic problem[s in] cooperation with lead bank[s,] other financial institutions s[uch as] cooperative credit societies i[t will] evolve a district production[, em]ployment and a credit plan

The district planning boa[rd will] have direct links with the [national] planning commission. There [is no] need to have state planning [boards] as these provide scope for [centrali]sation in economic directive[s and] concentration of economic a[nd poli]tical power The planning c[ommis]sion will have to be recons[tituted] so that the district planning [boards] get a chance to represent [them]selves on the apex body.

The task of the new p[lanning] commission will be quite d[ifferent] from the present ones It [will] only formulate the broad ec[onomic] goals and policies of the g[overn]ment. The implementation will be dealt with by the planning boards keeping in v[iew] guidelines of the national The details of economic p[lanning] will be made by the regional who will adjust the overal with their own local set-up instance, if eradication of [poverty] and unemployment be the p[olicy of] the national body, it is up lower bodies to see how the[se pro]blems are eradicated. The[y] take their decisions in the of their regional set-ups. T[he] policy for eradication of [poverty] and unemployment of a dis[trict in] a hilly region will be quite d[ifferent] to that of a district in the Similarly backward district have their own priorities of economic problems. The the entire scheme is to se[e that] planning suits the local and al needs which ultimately w[ill suit] national ones. Thus planni[ng should] be done from below and no[t from] above as it has been done s[o far]

mestic Wastes

R. R. KHAN

TILISATION OF domestic waste water or the sewage for gation is practised in India since . Besides containing water, ge has substantial manurial and conditioning values. In India, one hundred cities have partial complete sewage-disposal devices. of about 800 million gallons sewage produced per day the country, as much as one d is disposed of on the land If rest is properly regulated and ycled, it can contribute to solv- some of our chronic problems scarcity of water, energy food, tilisers and those of water pollu- n.

Treatment to this liquid waste ults in the production of about lakh tonnes of sludge every year ving the water clear. The water after the treatment is ideal for gation purpose.

BETTER CROPS

Experiments conducted at the ional Environmental Engineering earch Institute (NEERI), Nag- over a period of four years g high yielding varieties of wheat a test crop showed that sewage tion and its nutrient fortifica- s with chemical fertilisers were ful in getting maximum benefit studies also revealed that there e no marked changes in the soil perties as a result of sewage ir- tion and that sewage irrigation pecially beneficial for short ation crops and vegetables ps such as papaya and plantain w ideally with the help of age water.

The Western regional station of ional Dairy Research Institute DRI) at Bombay has evolved a em of recycling animal wastes cowdung and urine for grass duction on their demonstration n. The solid wastes are conver- into compost in a plant. The id waste is collected in a sedi- itation tank and pumped through prinkler system to irrigate the onstration farm. With this ingement of once-a-week sprin- irrigation equivalent to two in- s of rainfall, an unexpectedly yield of fodder has been ob- ed. In 1971, NDRI production ched a world record of 160 ton- of green fodder per acre per um.

ject to utilize sewage and to check the pollution of the Ganga at Varanasi taken in hand a few years ago, is now nearing completion. The scheme envisages diverting sewage waters into a farm outside the city. A similar scheme has also been drawn up to check pollution of Yamuna at Mathura with a total outlay of Rs. 67 lakh. The degree of sewage pollution of Yamuna at Mathura is 7-8 times that of Ganga at Varanasi.

FISH FARMING

It was established in early fifties that fish can live on raw sewage provided it was aerated continuously. Investigations on the ecology of sewage effluents at Chelsea College London revealed that large marketable food fish can be grown in sewage effluents without the outlay of money needed for artificial feeding which on a commercial fish farm can comprise up to 40 per cent of running cost. Nitrates and phosphates present in sewage are readily assimilated resulting in luxuriant growth of plankton which in turn are consumed by fish and help in its growth.

Fisheries experts recommend species of fish which feed at three different levels, Catla, rohu and mrigal which are respectively surface, column and bottom feeders for release into the sewage irrigated ponds. Some of the hardy fishes like mirror carps are also recommended because they are tolerant to low levels of dissolved oxygen

At places where recycling of sewage is not possible, the intake of sewage into the pond should be so regulated as to keep the dissolved gases and suspended solids well below the lethal limits by diluting the sewage prior to its release into the fish pond. According to one report from Tamil Nadu Department of Fisheries, fresh water 4-10 times the volume of the sludge is required for proper dilution. Excess of sewage in the pond leads to a decline in the dissolved oxygen thereby resulting in the death of fish due to asphyxiation.

Due to inadequate utilization of available sewage and lack of proper scientific data on sewage fish farming, the per hectare production of fish grown in sewage irrigated farms in India is only 400 kg per annum as compared to 3,000 kg per annum in Japan and 3,760 kg per annum in Israel.

In oxidation ponds, sewage is allowed to settle down leaving the settled mass or sludge when dried may be used as a feed to poultry, fish and pigs as it has high percentage of Vitamin B12 present in it. The dried mass is also rich in nitrogen, phosphorus and potash and can, therefore, be used as fertiliser for crops and fish farming.

A Rs. 12 crore scheme to produce 350 million tonnes of organic manure and compost based on farmyard and urban waste material has been prepared.

BIO-GAS

Another by-product which emerges after recycling of sewage is the biogas. Of late, the biogas plants have become quite popular in rural areas. There are some 20,000 to 30,000 biogas plants in the country, but according to the report of the Scientific Committee set up by the Indian Council of Agricultural Research, the maintenance of such plants is extremely poor. The reasons listed are the high cost of installation, marked fall of production of gas during winter and social prejudices.

Scientific studies have shown that undiluted wastes are not the best form producing biogas. Maximum benefit could be achieved when the wastes contain 5-9 per cent of dry matter.

In India, the gas production potential of the excreta of many farm animals like goat, sheep, pig, horse, camel and poultry has been tried. Poultry excreta provides maximum amount of gas followed by those of pig, goat, sheep, horse and camel and gas production starts within a few hours. On the other hand production of gas from cow and buffalo dung is not only low but it takes two to three weeks in warm weather before gas production begins.

FINANCE FOR DEVELOPMENT OF BANDA DISTRICT

M. E. Haque

Union Bank is one of the many nationalised banks extending its services in the under-developed district of Banda (U.P.). During a recent survey it was found that since its inception in December, 1975 the amount deposited with the bank up to 26-8-1977 i.e. one year and 8 months, totals Rs. 19.45 lakh with 1,368 account Nos. Out of this total deposit the bank provided advances amounting to Rs. 5.46 lakh to poorer sections of society, for different developmental schemes.

Yojana Quiz

1. What are the Apocrypha ?

2 Which are the smallest countries in Europe ?

3. How fast do the following animals travel ?

   (a) Cheetah

   (b) Race horse

   (c) Lion

4. Shakespeare's women characters are not so talkative as his men. ı King Lear Cordelia endeared herself to every reader with how many nes ?

5 What is a stalactite ?

6. How does a mirror enable us to see ourselves ?

7. What is the great hole in the Kalahari desert ?

8. What is the first Indian coloured film ?

ANSWERS

1. The Apocrypha are books written in very early times and pu forward for acceptance as scriptures, either in the old testament o the New Testament, but not accepted by the whole or by any pai of the Christian Church

2. There are three independent European countries each with ai area of less than 100 sq miles—Liechtenstein, San Marino and Monaco.

3. (a) 128 Kms an hour (b) 56 kms per hour (c) 99 kms a hour

4 Only 115 lines

5. A stalactite is like an icicle, and is formed in something of th same way by water, which tickles down and hardens into a solid.

6 A mirror is made with a layer of quick silver behind it. I that were not there we could see through the glass as we see throug the window, but the quick-silver prevents the light going through an sends it back again. The glass and the quick-silver are both perfectl smooth and we can see ourselves in anything that is smooth and fla and that is able to throw the light back to us

7 It is a mighty hole half a square mile in area with nearly per pendicular walls and more than 160 feet deep

8. Sairendri of Prabhat Studio Coloured in Germany

Quotation Box

Only fools do not differ

—Morarji Desai

*

Do not worry if the father is in jail. You have the mother who is still free.

—Mrs. Nusrat Bhutto

REVIEW ARTICLE

Gandhian Alternative to Present Political System

ARUN SHARMA

THE PARLIAMENTARY system of democracy with its party government has been with us for nearly three decades now. We have seen the best and the worst features of this system. On the positive side, we have seen the building of giant steel plants, construction of huge dams and reservoirs, extension of agriculture and increased international trade. But as the architect of the "modern temples", Pandit Nehru, succinctly put it, with all the developments taking place in the country, the rich had become richer and the poor poorer. Democracy, in real terms, thus did not mean a thing at all to the ordinary citizen.

The worst features of the Parliamentary system were of course witnessed during the period of the country's stewardship by Mrs. Gandhi, especially during the last nineteen months of her rule No one can deny that she did some very good things for the country. But her efforts to hold on to power at any cost after the election petition went against her, revealed some of the ugliest features of the so-called democratic system enshrined in our Constitution.

Under this system an elected Prime Minister, was able to assume extraordinary and unprecedented powers of coercion, declare an emergency, nearly eliminate all her political and other opponents, muzzle the press and rule the country with unparalleled ruthlessness But what about the common man who expected to derive some of the great benefits of *Ramrajya* promised by the great leaders of the Congress ? The current value of the rupee, which is just a little above one-fourth of what it was before independence, is an index of the sufferings the common man has had to experience in the last thirty years of unbroken Congress rule. If this is what the Parliamentary system of government can offer the country, is it not time for us to experiment with some other political system ?

The Lincoln Institute of Social Research and Public Opinion, Dharwar, (LISRPO), a non-partisan public body, which aims at bringing together academic experts and policy-makers in the common task of improving the tone and tenor of our public life has published an interesting thirty page pamphlet. According to its authors the time had come for giving a trial to what they describe as the Gandhian alternative to the present political system The timing of the pamphlet coincides with the complete rout of the Congress at the polls and the victory of the Janata Party and especially the declarations of the Janata Party leaders and Shri Jayaprakash Narayan and others that they would follow Gandhian ideals in their efforts to serve the people

The pamphlet, which is in three parts, points out that the Western political system was rejected by Gandhiji as early as 1916. Though he had not specifically laid down an alternative, the LISRPO, which has done a lot of research into the massive literature left by Gandhiji, is of the view that Gandhiji left enough hints on the basis of which one could form an alternative to the present political system. They claim that this work has already been done by Gandhiji's follower, Shriman Narayan.

One of the main reasons which compelled Gandhiji to reject the Western political system was that it separated religion from politics. Gandhiji was firmly of the opinion that the two were so closely interlinked that they could never be separated. His second, and probably the more important, reason was that the State should control society. This is something absurd for Gandhiji because, society is the source of power and a system which allows society to be controlled by the State, is completely wrong.

Gandhiji's life and views were unique in several respects, some of them in their apparent contradictions For instance, Gandhiji could not think of separating religion from politics, but he appointed Nehru, to whom religion did not mean a thing, as his "political heir" Moreover, it will not be wrong to presume that though Gandhiji, had rejected the Western system as far back as in 1916, he had already begun to compromise (or had he become realistic ?) after the transfer to power This may or may not be correct, but it is a fact that Gandhiji was alive for a brief while to witness the actual functioning of the Western political system in India under Nehru. The authors, in their zeal for everything Gandhian probably did not attach importance to this point. But it is quite on the cards that if Gandhiji were alive today, he might have accepted the Western political system with some important amendments to suit Indian conditions.

The pamphlet deals comprehensively with the Gandhian political model under which the society will control politics, and not *vice versa*. This means that all political institutions will be subject to control by the people. Another significant point is that power would be so completely decentralised that the village, which is at the base of the political pyramid of power, and, of little significance now, will become politically the most significant in the national system Gandhiji rejected the party system because under this, people only exercise their voting rights They have little control over the political processes Also, the system provides opportunity for rich people to capture and occupy positions of power.

It is good that the authors of the pamphlet are aware of the fact that the Gandhian model will present its own problems It would have been better if the authors also recognised the fact that in the present day world, the Gandhian model cannot deliver the goods and had Gandhiji been alive, he would have himself amended his so-called plan They have, however, a genuine complaint that the Gandhian ideal has been totally ignored by his followers despite the fact that the "Western system has been faced with constant crises and riddled with hopeless dilemmas of self-contradiction" The authors believe that it is possible to reconstruct the Gandhian model and renovate the Indian political system with the help of Gandhian political ideas and values They, therefore, present what they call a practical alternative to the current system based on ideas from Gandhiji's own writings and the writings of his distinguished followers like Vinoba Bhave, Jayaprakash Narayan, Ram Manohar Lohia and others

Reform of the Indian Political System: The Gandhian Alternative : *The Lincoln Institute of Social Research and Public Opinion, Dharwar ; Pages* 30, *Price Rs* 3

In the third and last part of the pamphlet, the authors declare that the full expression of Gandhian values and ideas would not be realised except through the implementation of the recommendations contained in the Gandhian model. They admit that this would be something like a total revolution in the country, a Gandhian revolution. Considering the immensity of the problems to be faced, the authors suggest that before the Gandhian plan becomes historically practicable, there should be a clear-cut strategy to prepare the grounds for such an eventuality. They have, therefore, made detailed suggestions to convert the present system to the Gandhian model to the extent possible. They feel that within the existing conditions, some changes could be made in the election commission and the administrative and the educational systems Changes could be made in the local self-government and the economic system including the planning process There are suggestions to reduce the status of the ruling party during the elections to the level of the other parties, to prevent the use of governmental machinery to influence the electorate, by making the AIR and the DOORDARSHAN into autonomous corporations, to put an end to the role played by money during elections, reduction of voting age from 21 to 18, speedy disposal of election petitions and steps to end corruption at all levels Drastic changes are also proposed in the present Panchayati system so that bureaucratic interference and control is minimised and public participation and control maximised.

The authors are gratified that the Janata Party leaders have expressed their desire to follow the ideology of Gandhian economic decentralisation. They suggest that there should be a modification in the economic landscape so that it will be dominated by small and medium units managed by the people and for the people. This system, they say, will generate more employment, bring more economic satisfaction and reduce present tensions within the political system. In the end the authors express their conviction that the ultimate and the immediate solution should be based on the ideas of Mahatma Gandhi, Jayaprakash Narayan, Ram Manohar Lohia and Dr. Ambedkar.

After a careful study of the pamphlet, one gets the impression that one could agree with most of the recommendations of the authors in regard to the transition period before implementation of the Gandhian model. One feels at the same time, however, that while some of the views and values of Mahatma Gandhi are capable of being implemented, some others such as the complete decentralisation of power and the distribution of finance are totally impracticable. In the last three decades, our independence was threatened at least thrice. Now the question arises as to who will safeguard our hard won freedom if the seat of power i e effective power, is spread all over the countryside? Again, how will a weak Centre, with a meagre 15 per cent resource, spread over several departments discharge its essential function of defending its territory. The Gandhian model may suit us during periods of unbroken peace, but not during external aggression

One can, of course, agree that the Western Parliamentary system does not completely satisfy our needs or suit our genius. But then, this does not mean that we should throw away the baby with the bath water There is no reason why we should not amend it drastically if necessary, to suit our needs. There is much in the Gandhian model also which can be taken to suit our needs We should remember that Gandhiji was a great pragmatist. Were he alive today he would have himself suggested changes in his so-called model

Development Notes

Power Rise in Haryana

Power production in Haryana has increased to 67.50 lakh units a day from mere 17 lakh units in 1966. It is expected to rise further to 90 lakh units a day by early 1978 against the current demand of 80 lakh units by the agricultural and industrial sectors. This additional power is expected from Dehar and Pong Power houses complex likely to go into generation by the end of this year.

With the commissioning of a thermal unit of 60 mw at Faridabad, two units of 110 mw each at Panipat, now at various stages of construction, the power production will stand at 150 mw units a day by the end of 1979.

New Wheat Variety for Rainfed Areas

A new wheat variety WL-410 for cultivation under rainfed conditions, has been evolved and released by the Punjab Agricultural University. This is disease resistant and yields higher than the previous wheat variety C-306 recommended for similar conditions in the State.

WL-410 is a semi-dwarf, highly resistant to loose smut and possesses high degree of field resistance against the yellow and brown rusts. It yields 25 quintals per hectare and has been identified as a superior variety for the *barani* conditions of the entire North-Western plains of India.

Neem Oil for Curing Hides

The Central Leather Research Institute has evolved a new method of curing raw hides and hides and skins with a mixture of organic compounds obtained from neem oil which will dispense with the use of common salt forming a major pollutant in tannery effluents.

The other advantages of the new methods are (1) there is no deterioration in quality of skins during storage; (2) soaking back is easy without resorting to use of wetting agent and bactericides; and (3) transportation cost is reduced and quality of final leather is comparable with that of leathers obtained from wet salted stock.

Handloom Project for Tripura

Tripura's handloom and handicrafts industries will receive a boost with the implementation of development schemes taken up by the Handloom and Handicrafts Development Corporation. The corporation has drawn up a Rs. 52 lakh project for development of the handloom industry which employs over 97,000 weavers, mostly tribals, and 4,000 others and accounts for annual production worth Rs two crore.

For the handicrafts industry the Centre has already sanctioned Rs. 48 lakh export-oriented scheme currently under implementation.

The handloom is the largest single industry of Tripura with about 123,000 looms installed. Products of the industry currently go to Hungary, West Germany and Australia.

Power Generation in UP to be Augmented

Power generation in Uttar Pradesh is to be augmented at a cost of Rs. 259 crore during the current year. Under the scheme 40,000 private tube-wells and pump sets are to be energised and 5,000 villages and 5,350 Harijan bastis provided electricity. With the implementation of the scheme, the installed capacity of power generation in the state, by the end of 1977-78, will reach 2,991 mw from the present 2,651 mw capacity. An additional 376 mw capacity will be generated by commissioning 110 mw and 66 mw units at the Harduaganj thermal power station and 200 mw station by Obra thermal power station by the end of March 1978.

The 400 kv transmission line, considered the biggest in the country is likely to be commissioned by the end of the current year between Obra-Sultanpur-Lucknow for distribution of the bulk power to be generated at the Obra power complex This increase in the power generation capacity is officially recognised as over 50 per cent of what has been achieved in the State during the last thirty years.

New Implement for Soil Preparation

A new implement called 'rotating-auger plough' which is in use in some European countries and reduces the cost of soil preparation to half or even less is likely to become common in the rice growing areas of Punjab very soon. It can prepare the seedbed for wheat in a field where paddy has been harvested in a single pass while normally it takes 4 to 8 passes with conventional tractor-driven implements. This implement, the cost of which when manufactured indigenously will be around 6,000 rupees, can be operated with a tractor of 30 H.P. and above. It can prepare one acre of land in about one hour

Centre Approves Two Industrial Units

Two industrial units-an HMT watch assembly factory and 10,000-tonne industrial explosives plant-have been cleared for Rajasthan. The watch assembly unit is one of the 12 proposed to be set up in the country to attain self-sufficiency in watches in three years.

The scheme envisages manufacture of both mechanical and electronic watches. The present demand of six million watches a year is likely to rise progressively to nine million a year in the next five years The present plan for expansion of capacity is expected to meet this demand.

The Rajasthan Industrial and Mineral Development Corporation, a state government concern will set up the industrial explosives factory It will meet the demand for mining operations in which the state is one of the foremost in the country.

Irrigation Schemes for Tribal Areas

Rs. 17.62 crore would be spent on four medium and 395 small irrigation schemes in Bilaspur and Raigarh districts of Madhya Pradesh this year. The schemes include 47 small works in the tribal areas of Bilaspur district under the tribal sub-plan and 64 small works in the tribal areas of Raigarh district under the same plan

Completion of the above schemes will mean the extension of irrigated area in two districts by 86,000 hectares.

The Position of a Prime Minister

The Prime Minister's position, according to my conception, is certainly pre-eminent, he is first among equals. But he has no overriding powers over his colleagues; if he had any, a Cabinet and Cabinet responsibility would be superfluous. In my view the Prime Minister, as the leader of the party and the head of the whole administration, is inevitably concerned that Cabinet decisions are effective and that there is no conflict between one Ministry and another. But the entire responsibility for implementing the policy of Government rests upon the Ministers and Ministries under them which are concerned with the subject matter of the Cabinet decisions. He has accordingly the right to ask for information from the Minister concerned as well as the right to consult and advise on the lines of policy to be adopted and even the manner in which the policy is to be implemented. But the responsibility for the implementation of the policy must be that of the Ministry concerned and of the Minister in charge, and the Prime Minister should influence action by way of consultation with and advice to the Minister. I feel sure that this position of the Prime Minister not only fully safeguards his pre-eminence and makes him an effective head of the Administration but is also fully in accord with democratic principles and rules of ministerial and Cabinet responsibility. This is also, as far as I have been able to ascertain, in accord with the UK practice.

From Sardar Patel's note to Mahatma Gandhi

ON SERVICES

I need hardly emphasise that an efficient and disciplined and contented service, assured of its prospects as a result of diligent and honest work, is a *sine qua non* of sound administration under a democratic regime even more than under an authoritarian rule. The service must be above party and we should ensure that political considerations either in its recruitment or in its discipline and control are reduced to the minimum, if not eliminated altogether. At the same time, I fully appreciate the importance of ensuring that the services are amenable to the control and discipline of ministers, both provincial and central. This is all the more important in an all-India service where it is obvious that recruitment, discipline and control etc have to be tackled on a basis of uniformity and under the directions of the central government which is the recruiting agency. This consideration has already influenced us in evolving the rules and regulations for the existing IAS and IPS which have been settled in consultation with provincial Governments and which, by providing provincial ministers' control in certain comparatively minor but not at all negligible matters, have made due allowance for the prestige and powers of provincial ministers.

From Sardar Patel's letter to Jawaharlal Nehru

April 27, 1948

Salute to the Sardar

Matchless Bravery

It was a great privilege for me to have been with Sardar Vallabhbhai. I was well aware of his matchless bravery and his burning love of the country, but I have never lived with him as I have had the good fortune during the last 16 months. The affection with which he covered me, recalls to me that of my own dear mother. I never knew him to possess motherly qualities. If the slightest thing happened to me he would be out of his bed. He superintended every little detail in connection with my comforts. He and my other associates had conspired to let me do nothing. His solicitude for the farmers of Bardoli and Kaira I can never forget.

Mahatma Gandhi *after his release from Yervada Jail* in 1933)

Warm Heart

I was warned before I came to India that I should meet my match in a very tough guy, Sardar Vallabhbhai Patel, but when we met I came to the conclusion that he could not be quite as tough as the act that he put on. He is so very apparently hard and firm and unyielding, and I think he is like that because he doesn't want the world to know that a very warm heart beats behind that rugged exterior.

Lord Mountbatten *on the eve of his departure from India*

A Great Captain of Forces

It is a great story that all of us know and the whole country knows. History will record it in many pages and call him the builder and consolidator of the new India and will say many other things about him. But perhaps to many of us here, he will be remembered as a great captain of our forces in the struggle for freedom and as one who gave us sound advice in times of trouble as well as in moments of victory, a friend and colleague and comrade on whom one could invariably rely, as a tower of strength which revived wavering hearts when we were in trouble. I who have sat here on this bench side by side with him for these several years will feel rather forlorn and a certain emptiness will steal upon me as I look at this empty bench.

Jawaharlal Nehru
(Speech in Parliament)

Outstanding Leader

Sardar Patel played an outstanding part in the great events of this generation and his name will have a permanent place in the annals of India.

Clement Attlee

Extracts from

Janata Party's Economic Policy Statement

THE JANATA party is pledged to the building of an economic system which will ensure the basic requirements of bread, freedom and equality. The record of human history shows that freedom and equality in absolute terms are in conflict, where one alone prevails the other shrinks.

The Janata party is of the view that there is need to develop an alternative both to capitalism and communism. The party believes in treading the path of Gandhian socialism on political and economic decentralisation It believes in creating a society largely based on self-employment It holds that an egalitarian society can be built with narrow income differentials and in which citizens will have the freedom and initiatives to shape their economic life within the framework of social regulations

The Janata party is opposed to any economic system which allows individuals or groups freedom to exploit others, at the same time it is not in favour of the state possessing unlimited power which will destroy all initiatives and freedom and result in the establishment of a totalitrian society.

The Janata party desires the widest possible dispersal of ownership of property and means of production This is the sole guarantee of social justice and democracy Free market capitalism leads to concentration of economic power in private hands Ownership of all means of production by the state would lead to concentration of power in the state. Such concentration inhibits freedom in one case, and gives rise to disparities in the levels of living in the other case, thereby engendering social and political tensions

The Janata party, therefore, will put a curb on economic power (i) by imposition of physical limits where feasible, both on existing possessions and future acquisitions, (ii) through differential taxation on incomes and wealth and other appropriate measures so as to reduce these inequalities to the minimum and (iii) to regulate or demarcate the techniques or the mode and scale of economic operations, particularly in the sphere of industrial production

Concretely the Janata Party will strive for the establishment of an economy which will :

(a) (i) ensure higher production per unit of land in the field of agriculture, because land is the crucial limiting factor in our conditions and, therefore, valuable ;
(ii) ensure optimum production per unit of capital investment in the field of industry because capital is comparatively scarce ;

(b) provide maximum employment per unit of land in agriculture and per unit of capital investment in industry, as we have a huge population to support and unemployment is on the increase ;

(c) ensure equitable distribution of the national product ;

(d) prevent exploitation of others' labour so that opportunity is provided to the largest number of our people for development of their personality and pursuit of their individual aptitudes ; and

(e) ensure that even private property is used to subserve the common good in accordance with the trusteeship concept advocated by Gandhiji

The new thrust of the Janata economic policy would, therefore, be growth *for* social justice rather than growth *with* social justice

The dynamics for the change-over to such a society and economy would be provided, in the first instance, by the utmost decentralisation of the process of planning, and, in the second, by the elevation of agriculture to the predominant position and finally by mass-oriented industrialisation

The party calls upon the government to so reshare the economic policies that the annual average rate of growth of the economy can be raised to seven per cent per annum during the next five years This would require a substantial increase in investment backed up by increased efforts at mobilisation of domestic savings Our economic policies, including fiscal and monetary policies, would have to discourage ostentatious consumption and promote the habit of saving, austerity and swadeshi.

The party is greatly concerned at the sluggish rate of increase of agricultural production in the last twenty years averaging no more than the rate of population increase Without a rapid increase in agricultural production there cannot be a sustained increase in the standard of living of the ordinary people Since 80 per cent of our people live in rural areas, without a rapid increase in their purchasing power, even the market for industrial goods and hence the scope for industrial development must remain restricted

AS AN IMMEDIATE objective, the government should aim to raise the share of agriculture and rural development to at least 40 per cent of public sector's investible resources exclusive of metalled and asphalted roads, transport and education but including electricity used for agriculture and village roads The primacy of agriculture to which the Janata party is firmly committed implies that hereafter the needs of rural areas for public investment will be met to the limit of productive absorptive capacity of rural areas.

We have viewed with considerable concern the imbalance in the allocation of credit for working capital needs in the urban as against the rural sectors of the economy. The major portion of finance and credit is today going to the urban and industrialised areas and inadequate funds are being pumped into the rural economy. Every effort must be made to reduce dependence of agriculture on private money lenders through development of institutional network We also recommend that the deposits mobilised by the commercial banks in the rural areas should be earmarked for rural development.

A fifteen year national plan for the development of irrigation should be evolved without delay. Emphasis should be laid on fully utilising the potential of quick maturing small scale and minor irrigation Local labour, local resources, gram panchayats, cooperatives and, above all, voluntary agencies should be effectively harnessed for extending such irrigation

In the long run soil conservation is even more important than soil utilisation. Government should,

"Implementation of plans is intimately associated with better organisation and operation of the general administrative machinery . . .The structure of the older organisation. . has to undergo modification . . . Unless the expert begins to work at problems of plan formulation and implementation not chiefly from the point of view of feasibility of technical performance or optimum technological requirements but from the point of view of what could be the best arrangements under given administrative and economic constraints, his contribution to planning would not be very effective".

From the fourth five year plan

Administration for Development

THE BASIC assumptions behind the kind of development effort that has gone on for about a quarter century are now being subjected to a critical review. Statements on behalf of the government, the party in power at the centre and the planning commission suggest that there is very likely to be a departure, in many ways, from the policies so far pursued. Not only is there talk of greater emphasis on agriculture, rural industry and rural employment, but there are frequent references to the need for political and economic decentralisation. A direct relationship between political democracy, individual rights and personal freedoms on the one hand and people's sector (as different from the state sector), self-employment schemes, local initiatives and voluntary effort on the other hand has been emphasised in several policy pronouncements

How does the present administrative system fit in this new order? Even for the kind of planning which we had for about 25 years, it was being increasingly recognised that the existing system was inadequate and even antithetic to the objectives of policy. One can see references to this inadequacy in some of the previous plan documents. Even so, very little was done to refashion the administrative system. The reasons are not far to seek. Since very strong vested interests had developed in the civil service structure, and since the vested interests had gained control not only of the administration but also of the policy-making apparatus, they could successfully frustrate every effort for reform. Besides, the nexus between a decaying political set-up and an aggrandising bureaucracy made certain that no worthwhile reform was possible. The licensing and control policies had their own logic.

The main criticisms against the present administrative system are that it is stodgy, cumbersome, costly, time-consuming and insensitive Responses are slow and procedures are rigid. There is little scope for innovation and imaginative enterprise. Administration, far from being an aid to the people has become a burden on them. Areas where the administration meets the people are sorely neglected. In a system where many men are accountable, no one, indeed, is accountable Besides, there is mutual suspicion and, consequently, reluctance to delegate power down the line. From every point of view, therefore, there is urgent need to objectivise, simplify and functionalise the system, so that it can be target-oriented, easily accountable and based on the interacting principles of individual and joint responsibility.

MUCH OF INDIA'S drudgery needs no great investment to overcome. It is not always a question of resources. It is often a question of attitudes and approaches.

The expansion of the civil bureaucracy in the years of planning has little relation to the needs of development. This, in turn, has strengthened urban consumerism and parasitism, with disastrous consequences for the economy. A non-functional and non-productive civil system is not only an evil in itself, but is a great milestone round the neck of the people.

bureaucracy had the effect of conferring on the functionaries privileges disproportionate to their social usefulness. The result has been that the civil service soon got lost in a spree of acquisitiveness and careerism with little thought of the rationale for its existence. The distance between the public "servants" and the public gradually increased ; and the servants have long ceased to be motivated by the "will to serve". Overlordship tendencies have grown ; the administrative styles are marked by cynicism, smugness, paternalism and authoritarianism.

ANOTHER FEATURE of the present system based on a permament bureaucracy is the illusion of competing seats of power. Even as the theory of commitment to a political policy was irrelevant to a permament civil service, the argument of a separate sphere of inviolate and independent administrative jurisdiction is contrary to the system of parliamentary democracy with the cabinets responsible to the legislatures.

Apart from a general need to overhaul the system, some urgency for such an overhaul is imparted by the new policy goals of the government and the planning commission. The idea of autonomous corporations was introduced when the state entered the area of industrial and other economic activity in a big way. While this was an improvement upon departmental management of public enterprises, this did not represent a radical change in the administrative ethos. The concept of accountable autonomy will work only if autonomy itself is broken into sub-autonomies. Basically, the problem of administrative reform is how far the centralised infrastructures can be dismantled. Even evaluation and project appraisal should be built into a system of autonomies with powers, responsibilities, targets, economies and budgeting going together.

It would be disastrous if the parasitic urban administrative culture is extended to the villages in the name of creating new organisations for rural uplift. A disquieting aspect of the Punjab scheme for creating "focal points" is that a separate development infrastructure under a commissioner is being contemplated. Shri V. T. Krishnamachari was credited with the view that an administrative approach to the community development scheme might destroy the idea He was, at that time, reported to have suggested to Jawaharlal Nehru that, instead of creating a new class of career-oriented CD hierarchy, the prime minister should try to draw on the energies, idealism and enthusiasm of a large number of congressmen who had taken part in the freedom struggle. That advice may be even more valid today after the experience of the CD programme. It should be possible to find a large number of dedicated young men in the country who can be associated with the development effort. Even the training programmes should be so arranged that the men on the job will be able to guide the planners about the problems involved in implementing a particular course of policy. Data collection, socio-economic surveys and economic census need not hold up any programme. Once a task is undertaken, the data will flow from the performance of the task; training, evaluation and appraisal will then become a two-way process.

In any event, the new personnel to be involved in the tasks of rural communication (including information, education and even posts and telegraphs), water management, power development, rural industry, agricultural extension, rural banking, rural credit, village policing etc. should be outside the present omnibus, monolithic administrative structures. New forms of target-oriented, easy-to-monitor personnel systems linked to performance and detached from the high-wage, career-based bureaucracies have to be evolved. This should provide adequate scope for local initiatives and an excitement of challenge and response. The village infrastructures should themselves be catalysts of social transformation, so that a self-sustaining process of rural development may be set in motion

Over a period of time many of the metropolitan infrastructures should be enabled to disappear, leaving behind only small standard-setting, policy-making and research-oriented institutions, which, too, could be further dispersed. The line of command arrangement should give place to an interacting system between the field and the simplified policy formation institutions

To try to infuse a new administrative culture into the present system or to make a new kind of civil servant of the present personnel will be next to impossible The best thing to do will be to let the present system wither away. The least that the planning commission can ensure is that this system shrinks fast and does not expand

FINALLY, THE GOVERNMENT and the planning commission will be in great error if they think that any new policy has even the remotest chance of success with the present administrative system. The commission's first task is to engage in a serious exercise of evolving new styles and forms of administration and a new kind of public functionary.

If the present bureaucracies are to be permitted to formulate plan schemes on the basis of an incremental approach, disaster is likely to overtake the country sooner than is probably understood by those who are in charge of policy. It is to be hoped that the government and the planning commission will not allow themselves to be stampeded into such a calamitous policy

Effort for National Consensus on Economic Policy

SHRI CHANDRA SHEKHAR has set the tone of political reconciliation by promising to seek the cooperation of all parties in the implementation of the country's economic programme. The economic tasks before the country cannot be those of a single party. It is the responsibility of all parties to mobilise the people for mass action to carry out programmes for their uplift.

To an extent NDC provides a forum for such a national approach. But an extra-official consensus is equally necessary in this as in other national tasks like communial harmony, harijan welfare and political decency.

While it is reasonable to say that the policy of the ruling party is essentially the responsibility of that party and it will be unfair to ask others to give their undivided support to it, is equally valid to expect that, at least in broad areas of economic development, there will be a truly national approach and effort. In a situation such as ours, the differences can only be on emphasis and not on basic goals And if one saw the major economic platforms of the national parties, one would be struck by the very large area of convergence of views. The congress party,

in particular, is as much wedded to Gandhian ideas, as the Janata party claims to be. Even the extreme sections of political opinion cannot be objecting to many aspects of the Janata party's economic policy statement. The objectives of mass employment, removal of mass poverty, bridging the urban-rural differentials, distributive justice, attack on urban consumerism and parasitism, austerity, people's involvement, new administrative styles to suit the new development strategy, reducing the wage and income disparities, wide dispersal of purchasing power, limitation on profits and dividends—to mention a few—can be achieved faster if there is a national consensus. The politics of reconciliation on this basis can be followed by a politics of confrontation, once the basic levels of ideological differentiation are reached One can make a new religion of science, technology and industry, some kind of opium not of the masses but of the classes. On the other hand, one can talk sensibly of the role of science and the rest in the larger scheme of things. The supreme consideration, as Gandhiji said, is man; science and industry are meant to serve him and, as Shri Chandra Shekhar said, can be bent to any scale that is in the best human interest

The argument that the new policy may benefit the rich farmer may or may not be valid But to argue that the rural poor is left out of consideration is, to say the least, a little uncharitable The new policy may not lead to the millenium. But it will certainly help in overcoming some of the worst features of poverty and exploitation. Once this is done, the battle lines can be drawn.

THIS IS not to say that valid and bonafide criticism and doubts can be brushed aside. The most common of the criticisms is about the vagueness in resource mobilisation for a seven per cent growth rate or forty per cent investment in agriculture, in the talk of surpluses to be generated by industry from internal resources and in the choice of technology as well as freezing and reduction of capacity in the organised sector. Another criticism has been that full account has not been taken of the fact that ours is no longer an economy of shortages. The problems of training 30 million more weavers in the handloom sector, supply of raw materials to the artisans and the marketing of their goods are real. Subsidised supply of farm inputs has come in for sharp criticism.

But the cynicism noticeable in the comments of some economic pandits leads one to suspect that the occasion has been sought to be used to talk from a pedestal to the gentry at large--an attitude which has made the commentator increasingly irrelevant to the scheme of things

There may be room for further compromises and adjustments. There is a planning commission which is bound to bring to these matters a realism which is seldom the strong point of the document of any political party anywhere. That realism will, however, be conditioned by a new mood in the country which can be missed neither by the planners nor by the political parties.

Smaller States : The Debate Has Just Begun

THE QUESTION of how big or small a state should be within the Indian union had been with us almost since the SRC submitted its report. The controversy began with a dissenting view in the SRC report about Uttar Pradesh.

The present debate on this issue is a little more serious than it has been in the past The home minister is credited with the view that smaller states would conduce to better administration and faster development, besides, of course, greater participation by the people in the formation of policy. Others have given expression to a similar view from time to time. The examples of Haryana and Punjab have been cited in support, though recent disclosures may throw some doubt on the thesis that smaller administrations are necessarily sensitive to public opinion.

It would be a little premature to conclude from some authoritative statements that the final word has been said on this issue. The debate has just begun and shows every sign of being joined in various forums.

The fear that smaller states would, in some way, undermine the integrity of the union seems somewhat exaggerated. With much less than half the population, the USA has much more than twice the number of states that we have, without the federal government being any the weaker for it. What is more pertinent, however, is that the size of the states cannot be discussed in isolation from consequential changes in the statute to strengthen the federal scheme.

The Janata party is setting up a committee to study decentralisation of power. One does not see why Shri Madhu Limaye should try to foreclose the debate on smaller states, as though this has little to do with devolution of authority.

SHRI JAYA PRAKASH NARAYAN has been long canvassing for smaller states to reduce the distance between the government and the people. Apart from other advantages, the greater time which ministers may devote to details of people's problems has been mentioned by him as a strong argument for smaller states which would also make for cultural homogeneity, as, for instance, north and south Bihar. Vaishali, Magadh and Mithila have all been brought together in the present day Bihar, not necessarily because this was in the people's interest but, more probably, because this was in the imperial administrative interest JP is of the view that smaller states would give meaning to the concept of grassroot democracy and take us nearer to Mahatma Gandhi's idea of *swaraj* According to him even Nehru was not averse to the division of the bigger states. JP thinks that smaller states, far from promoting divisive tendencies, would greatly reduce them, if not altogether end them.

The many views expressed on this question do not appear seriously to dispute the premises behind the argument. The major fear seems to be that any exercise in this direction may open the Pandora's box. It may not be wise to get bogged down in the mire of controversy and agitations over this problem when there are other and more pressing problems to solve. This is plainly the burden of Shri Desai's news conference in Bhopal The time is not opportune and few will disagree with this assessment.

The view that more states may mean increase in administrative expenditure and bureaucratic expansion may not be correct. Some new forms of direct relationship between the people and the government

may, in fact, cut down both. There is thus a bureaucratic vested interest in larger states. The division of Assam has proved that none of the best principles of good administration had been sacrificed.

SHRI PROMODE DAS GUPTA, who heads the policy-making body of the left front in West Bengal, has said an all-India convention is being convened soon to focus attention on the "need for readjustment of centre-state relations". JP may attend the convention.

It is good that federal policy is the subject of an idea debate. Though the difficulties are real and solutions may not be imminently available, the debate should be encouraged. The effort should be for a broad consensus of political and professional opinion which could be the basis for a further thrust towards democratisation of the political and administrative process. Non-official agencies can play a crucial role in organising meaningful seminars throughout the country on new forms of federalism which, while bringing the administration closer to the people, can, indeed, strengthen the Union.

Democracy, Police Bureaucracy and Prisons

THE GREAT confusion over the role of the police in India's public life, probably, can be traced to the peculiar expression "law and order", as though the two go together; over the years, "order" became more important than 'law" and, what is worse, "order" came to be associated with what was "convenient" and "comfortable" for the party in power or for the men in power.

The increasing involvement of the police force in what are essentially political functions has naturally led to the corollary of the political process being regarded more and more in terms of police power in its larger and narrower sense. The first casualty in this was the functional role of the police in matters like investigation, law enforcement, crime detection and protection of the people, particularly women, children and the down-trodden. The cynicism with which the police force, including its intelligence branches, has been blatantly misused in recent years, has not only demoralised a fine force of officers and men but has alienated them from the people

The home minister has never missed an occasion to speak on this aspect and try to correct the perspective In a recent address to IPS probationers in Hyderabad, he has clarified his repeated advice to policemen not to obey illegal orders. He has said that whenever they are in doubt, the policemen should ask for written orders from the superior officers; and when these orders are palpably illegal, they should disobey them

Refreshingly, he has by implication referred to the now famous "encounters" with the Naxalites. Maybe some groups, believing in violence, violated the law But that was no excuse for the police taking the law into their hands and usurping the powers of the courts.

Shri Charan Singh, however, has disappointed a good section of his supporters and admirers in the choice of personnel and terms of reference of the police commission. Unless he is able to satisfy the people that no opposition leader of stature was ready to head the commission, the criticism that he has gone back on his word will be hard to repudiate. The other personnel also do not seem to have been chosen exactly for their zeal for radical and basic reform Administrative experience—which often goes with rigidity and conservatism—has been preferred to idealism, enthusiasm for reform and acquaintance with social movements and sociology. The commission is very unlikely to inspire confidence unless its composition is radically corrected. It would be unfair to ask that the chairman and the members be dropped. What can be done is to expand the membership by inclusion of two or three women who have shown great interest in police and prison reform, preferably from the opposition political parties, social scientists, eminent men who have been in the forefront of the civil rights movement and representatives of the lower formations of the police force. Since it is the broad left movement which has largely led many of the political agitations in the past, it must have adequate representation besides those who had taken part in the Bihar movement.

While mention has been made in the terms of reference to investigative methods, protection of the weaker sections, the democratic role of the police force and the needs of the rural areas, a specific injunction to the commission to suggest how the police may be enabled to uphold the law and not subvert it and how they may disregard illegal orders is lacking Further, the commission has not been asked to suggest how a new rural force outside the present police hierarchy may be formed purely on the lines of the London bobby. This apart, a service component must be integrated into the career of a policeman

The conflict between the police force and the magistracy has to be resolved Even the police commissioner for Delhi seems to be in doubt because of administrative vested interest.

The home minister, whose keenness for radical eform of the administrative, police and prison systems has won him plaudits, may be expected to respond to these positive suggestions made by several quarters.

EQUALLY IMPORTANT is reform of the prison system. The disclosures before the Shah Commission have perhaps not shocked many in this country who have got reconciled to a slow erosion of every human value in the last decade or so The *Statesman* has done well to draw attention to the fact that even now Bihar's jails have some 12,000 inmates more than they were orginally built to house. What is worse is that nearly 26,000 of the 31,000 prisoners are yet on trial and should be presumed to be innocent till they are proved guilty In West Bengal, half of the 24,000 persons (the capacity of the jails is far less) are under trial. This, despite the recent release of some 6,000 prisoners It is a travesty of justice that men whose guilt is as yet uncertain should be thrown together with hardened criminals, unless it is government's intention to make sure that even innocent people become criminals. Equally scandalous is that "lunatics" are placed in jail under a 75-year old Act. This is hardly the way of curing them. Even orphans and the homeless are behind the bars.

The appalling conditions of sanitation, housing, food and medical treatment have been known to

exist, besides the impudence of bestiality which marks the attitude of the prison hierarchy to those who are their charge. It is not merely the prison code that has to be changed, as promised by the West Bengal jail minister; it is the entire system of keeping people in jail and subjecting them to inhuman treatment that has to be overhauled.

The constitution needs to be amended to provide for statutory authorities to inspect prisons, safeguard human rights, and ensure that no one is in prison without trial for more than a few months or a year at the most. Punishment for investigative inefficiency cannot be visited upon the hapless members of society

The Janata party, whose main platform has been human liberty and dignity, will be untrue to itself if it does not move swiftly in this matter.

AND FINALLY, the administration Political infighting should not obscure the basic point made by Shri Promode Das Gupta that the higher bureaucracy (secure in its service rights) sometimes has the effrontery not only to flout the orders of the elected government but to subvert its functioning There may be good reason to ensure that the officials are not at the mercy of a minister's whim But it will be a travesty of democracy if a minister has to be at the mercy of the official's whim and even arrogance This country, in recent years, seems to have witnessed only two qualities in the so-called steel frame—timidity and acquiescence in immorality in the hour of crisis on the one hand and extraordinary crust and defiance bordering on politicking in a democratic set-up The home minister should not dismiss Shri Das Gupta's statement merely because it comes from a leader of another party If the core of his charge is not investigated, there will be great danger not only to federalism but to political democracy in the country

The Punjab Enterprise

SOME twelve thousand villages in Punjab—the entire country side of the state, in fact will be brought under a new programme symbolically launched by the prime minister at the Assa Butter village The time schedule is five years The cost is put at Rs 302 crore, mostly to be got from institutional finance and World Bank loans A socio-economic survey of every village is being undertaken. This will give an idea of the extent of unemployment and under-employment. The objective of the programme is to stop the migration to the towns through regeneration of the villages The operational strategy is to maximise the use of local resources in men and material for the development of each cluster of villages. The immediate goals will be full employment, fifty per cent increase in farm output, renewal of traditional trades and industries and uplift of the weaker sections. Growth centres or focal points are to be identified and developed. Production, marketing and banking facilities will be made available within five kilometres of each village There will ultimately be 500 focal points, each catering to about 20 or 25 villages.

At each focal point, there will be a branch of a cooperative or commercial bank, agro-service centres, retail shops, a marketing yard, a hospital, a veterinary dispensary, a diesel or petrol pump and a post office with telephone facility. Later, there will be agro-based industries, cold storages, shopping complexes, community centre-*cum*-children's parks, sports stadia and cinema halls.

Soil and water conservation and subsidiary occupations like dairy, poultry and piggery have been included in the programme.

Obviously, a lot of detail remains to be worked out. Not the least important is the administrative and organisational arrangement which will be responsive and sensitive to problems as they arise, accountable, target-oriented, anti-hierarchical, career-proof, dedicated and enterprising.

Industry and Rural Development

THE CORRELATION between enlightened self-interest and the imperative of rural development is being increasingly recognised by industry, it seems. A committee of the Associated Chamber of Commerce and Industry (ASSOCHAM) has said that without the development of agriculture and activities designed to increase rural incomes, the market for the products of industry could well stagnate, "as is indeed happening with cloth, steel and other items". While asking industrial units to create viable projects of rural development and train villagers to execute them well, the committee is in doubt, however, about how soon industry can "put on the armour of rural development" A cautious approach (so characteristic of Indian "enterprise") is, therefore, recommended. Available (and necessary) resources will be identified in the first instance ; committed and trained personnel, with the backing of the management resources of a good company, will then be located ; afterwards, existing voluntary agencies will be sought after, which may be supported by industrial units by way of supplemental help in training and personnel. Or, the voluntary agency may be asked to work where the industry wants it to.

ASSOCHAM does not think much of financial commitment of any size. Industry's role will be in terms of personnel, training and advice ; the projects themselves could be financed by banks, for instance.

It is possible that industry's attitude, already influenced by the argument of an expanding domestic market through generation of rural incomes, may be further influenced by the guidelines formulated by government about corporate "enterprise" in rural development which may bring in tax benefits. An illustrative list of categories of rural projects, which may qualify for such benefits, has been given. Among them are help in setting up self-employment industrial schemes for the rural poor, establishment and running of dispensaries, maternity and child welfare centres and family welfare centres, nutrition programmes for school children, setting up and running of educational and vocational training centres, building and maintenance of rural link roads, village streets, pavements, drainage, drinking water schemes like wells and tube-wells and cleaning of wells and ponds.

The list also mentions provision of street lighting in villages and electrification of harijan and tribal homes, help in building houses for the weaker sections (sites to be provided from public funds), minor irrigation schemes including pump sets for small and marginal farmers, supply of improved seeds and facilities of seed testing as well as help in setting up seed farms for the small and marginal farmers, supply to these farmers of fertilisers and insecticides and training in their use and supply of plant protection equipment, farm tools and machinery to the panchayats for use by small and marginal farmers.

Animal husbandry schemes including veterinary dis-

pensaries, artificial insemination centres and processing and marketing of dairy products, help to marginal farmers and landless workers in poultry farming, horticulture and pisciculture and workshops to service and repair farm machinery as well as train artisans and mechanics will also receive consideration for tax benefits.

This announcement, together with Shri H. M. Patel's advice to the all India manufacturers' organisation to seek a strategy of growth through employment and Shri George Fernandes' assurance that encouragement to small units would not necessarily be at the cost of large units, should make for a visible (not symbolic) involvement of industrial houses in rural development programmes Such involvement in the past has been at the cost of village artisans, the benefit almost flowing to the business or industrial houses. Shri Fernandes himself gave the example of less than subsistence wages obtaining in the carpet industry which sells the carpets at fantastic rates at home and abroad. In the export market, Indian handlooms as well as primary commodities like jute, tea, manganese and iron ore have not had their due share Business and industry cannot all the time be complaining of poor returns without playing some role in the generation of rural incomes in the form of support schemes, payment of good wages and aggressive marketing of primary goods as well as products of village industry both at home and abroad with benefits flowing to the producers and artisans.

THE INDUSTRY ministry and the planning commission are reported to be working on support measures necessary for sustaining an ambitious programme of developing tiny units with an employment potential of three million in five years' time. Entrepreneurs themselves will be expected to invest about Rs. 2,200 crore in these schemes. Refreshingly, a totally new organisational form is being worked out for this massive programme Regulatory procedures for the small entrepreneur will be greatly simplified, reduced, and probably eliminated. These entrepreneurs will themselves be asked to regulate and assess their work To enlarge the flow of institutional finance to village and small industries, the lead bank concept may be modified, so that one bank may be responsible for meeting their requirements.

At the moment the bulk of assistance meant for the small sector is appropriated by the better-organised small units Units with an investment in plant and machinery up to one lakh rupees may have to be categorised separately for some preferential treatment Ninety per cent of the small units are probably in this category The investment subsidy of 15 per cent in backward areas may be converted into investment-*cum*-employment subsidy applicable to tiny units in areas of a population of less than 50,000. Other small units may get only 10 per cent subsidy.

Marketing support to the tiny units by the national small industries corporation will be strengthened. Income tax, excise and sales tax exemption for five years, graded system of reservation of items for production by small units, setting up of mini-industrial estates, creation of a special fund for infrastructural development in backward areas and conservation of local material for local use are among other measures which are being considered for encouraging the tiny units.

It is clear that new orientation of economic policy is not just so much talk. Obviously even the conservative civil bureaucracy seems to be bitten by this new bug And if industry is really serious about finding a market and a return, it will look not to the government but to the small-man—the worker, the entrepreneur and the artisan

Recognising the Naxalites

JP was among the first of the Gandhians to recognise the relevance of Mao and his Indian followers to our social and political movements. Some years ago he openly defended them even while he was not agreeing with their methods. He has since returned to this theme quite often. It is not surprising, therefore, that on the eve of his departure for Bombay for medical treatment, he should have issued a special statement asking the Naxalites to join with other revolutionary groups in organising *peaceful* mass actions for the well-being of the people.

Naxalites are known to be active in Bhojpur district where the harijans have suffered much and have responded to a particular form of resistance. JP's sympathies with the harijans have never been in doubt "The exploited classes have no alternative to uniting and asserting their rights". Class struggles may not be advocated but one cannot run away from them where they become inevitable. Only, these should be waged "firmly and peacefully". Violence would be suicidal

JP has reaffirmed his view that "basic problems cannot be solved except through organised people's power". A friendly government can "extend a helping hand" Only "revolutionary solutions" can be the answer to the malady of which the clashes in Bihar are symptoms

He has recalled his role in the 1974 movement when his effort was to channelise along peaceful courses what was threatening to become a violent upheaval In the bargain, he met with a totalitarian answer from the regime and the struggle took the form of a battle for democracy

Now, with greater scope for a peaceful struggle, JP has asked the Naxalites to join in a united effort to overcome the local tyrannies Ideological "blinkers", one hopes, will not come in the way of a positive response

Service and Recruitment Matters

A SINGLE national merit examination for several positions in the higher civil service has been again canvassed by the chairman of the UPSC, Shri Kidwai. He has also asked for appellate authority to be vested in UPSC to settle speedily service matters Shri Kidwai has answered Shri Charan Singh's suggestion by saying that the UPSC is no longer bewitched by the charms of the sophisticated urban, and looks to the potential of the candidate. Chairmen of the state public service commissions have agreed that there should be some bias in favour of the candidates from rural and backward areas and from minority communities as well as from poorer families Stress will be on objective tests. All applicants, with the prescribed qualifications, will be given the chance, *ex facie*, to prove their merit, without any preliminary weeding out. Some gadgetry seems to have been found to test this merit in the quickest possible time.

All this may help in the achievement of the social goals of recruitment. But the problem with the administration has been that once selected, an officer—

whatever be the background—becomes a boss and worse. What is required is a new administrative culture, a new ethos. This is where the political leadership comes in. Unless this leadership sets the pace of new styles of governance, all the refinement in selection and placement will be of little use.

Khadi Commission's Plans

THE KHADI and village industries commission has announced plans to set up raw material banks at selected places to ensure adequate supply of raw material at reasonable prices. Mini-industrial estates are to be set up to provide common work places to artisans. These estates will be supported by the raw material banks, financing institutions and marketing organisations. In 1978-79, the value of khadi produced will be over Rs. 75 crore. Production by village industries will be worth Rs. 250 crore. In the next five or six years, the commission hopes to generate five million more jobs. Already some two million people are employed.

The commission has begun manufacturing polyester khadi. Development of new design and market research are being given priority.

Civil Servants Versus Politicians

CHARAN SINGH

I HAVE never been able to understand why a great deal of debate goes on in our country over the relative roles of the political leadership of the government and the administration of the country. In a working democracy, "government" means or ought to mean the government elected by the people and answerable to them. In our system, based on division of powers, the cabinet is the executive It accepts responsibility for all executive decisions. The responsibility is both to Parliament and to the people.

The administration, as far as I can understand, is not the executive but the instrument of the executive In theory, there need be no permanent secretariat; in some countries, the civil servants, at least at the top levels, come and go with the minister, who has a certain prerogative in the choice of his advisers.

The Indian constitution does not explicitly preclude the cabinet's choice of its advisers. However, following the British pattern, we have so far adopted the concept of a permanent civil service. There have been instances, however, of the Cabinet going outside the permanent civil service to choose its top policy advisers.

No Question of Jurisdiction

Terms like sovereign jurisdiction have no meaning in a democracy. Even the people are sovereign only up to a point For example, the people cannot obviously decide upon the guilt or otherwise of an individual. Parliament and the cabinet function within the ambit of the constitution.

There can be no separate and inviolable sphere of administrative jurisdiction, in the sense that the cabinet or the minister cannot encroach upon it. The administrators' job is to understand the policy of the elected government, advise it fearlessly and independently, and carry out the policy once it is decided by the elected government.

Since the entire system is governed by the rule of law and morality, no civil servant can be asked to do what is illegal or unethical. A civil servant cannot take shelter behind a ministerial order, oral or written, to defend an illegal or immoral action. He should have the courage not only to advise fearlessly but to accept the consequences of defying an illegal or immoral order. The minister should be equally prepared to accept the consequences of such an order. Distortions (like the ones during the emergency) take place when there is a breakdown of the moral fibre of the politicians and top civil service.

Let it be clearly understood that the minister, as part of the executive arm of the state, has complete jurisdiction over all matters concerning his portfolio including even minor matters like transfers and appointments. But, a good minister will not exercise these functions, except where it is in the public interest to do so This self-discipline should not be confused with jurisdiction

A Matter of Bonafides

Ultimately the success of a system depends on bonafides. The administrator knowing that a minister is constructively responsible for what happens in the ministry would, in a good system, take care to see that the minister is properly advised and that the minister's orders are honestly carried out. Similarly, the minister will normally not go beyond policy decisions and supervision. In such a system of bonafides there is no scope for conflict of jurisdiction

A word of caution may not be overdue. The concept of constructive responsibility cannot be overstretched. If for every act of omission or commission of the administration, the concerned minister were to accept the responsibility, no minister can remain in office even for a day. Policy, vigilance, correction and insistence on codes of conduct are the principal areas where a minister should show courage, determination and leadership.

The difficulty in India has been the nexus between the corrupt politician and the corrupt administrator. The vast increase in government's powers of control and regulation has only served to provide innumerable opportunities for corruption and favouritism. But, in my opinion, the vast increase in corruption is largely traceable to the failure of political leadership whose duty it was to set standards.

Once the administration realises the minister's uncompromising adherence to the highest principles of ethical conduct, the moral authority of the minister would be a safeguard against administrative misdemeanours. But, this is essentially a task of political leadership.

Before I close, I wish to refer to the criticism of the circular, issued recently by the cabinet secretary, asking the civil servants to familiarise themselves with the contents of the Janata party's manifesto The criticism seems to arise from a misunderstanding. After all, the elected government is guided to a great extent by the party's election promises ; and the civil servants should at least know what these promises are. No one is asking them to accept the party's ideology or to be a "committed bureaucrat". All that is sought is to ensure that the civil servants know the policy of

(*Contd. on page* 30)

NOT MONEY BUT NEW ATTITUDES, NEW APPROACHES, ATTENTION TO DETAIL, PERSONNEL DEVELOPMENT

And We Can Do It

B. SIVARAMAN
Member, Planning Commission

ABOUT OUR thinking for the next round of the plan, it is necessary to be clear about how to go about it, particularly when we are trying to prepare a five year perspective starting from April 1978, and fit into the detailed programmes for 1978-79. Various sectoral plans are being worked out and it will take a little time. As originally contemplated, a certain amount is still available out of the fifth plan outlay for the next year 1978-79. This includes provisions for agriculture, irrigation and allied services. Agriculture and irrigation are being given the highest priority during the next cycle. I hope all the states will keep these allocations reasonably sacrosanct to meet the requirements of funds for the important programmes for the next year.

Stress is also being laid on finding employment within 10 years for all the unemployed and under-employed in the rural areas. This is not in conflict with our objective of production. It is a question of higher production being linked to generating employment for families requiring employment

SYSTEMS MANAGEMENT

We are planning to achieve about 1.5 million hectares of major and medium irrigation in 1978-79. It is necessary to check the reporting carefully. One of the casualties of the emergency was correct reporting. Everybody claimed performance; may be the performance was not there. I am saying this deliberately because the other day Nagarujunasagar reported that as against 25,000 hectares which they should have brought under additional command, the achievement was only 2,500 hectares So, all should have a look at the figures and ensure that targets are reached and financial requirements for the purpose provided But one important aspect, namely modernisation of the irrigation systems needs particular attention. This point has often been repeated but everybody is interested in starting new things, lengthening canals but not in modernisation which requires a tremendous amount of real competence in engineering and systems management. Senior officers of the irrigation departments must attend to this. There are three chief engineers under the irrigation secretary who can help in this task. Assuming that 1.5 million hectares come under major and medium irrigation, I believe, if one looks at the minor irrigation figures, it will also be of the order of about 1.5 million hectares. So in all, we have to achieve 3 million hectares next year for which provision exists both in the form of direct investment and institutional investment These points need to be checked to avoid any shortfall.

The integrated rural development programme is really employment and production-oriented In taking up this, we will have, first of all, to go through all the plan schemes—state, central and centrally sponsored, which have been sanctioned during the last four years—and carefully check if they are really producing the desired results; and if they are not, they may be cut out.

Non-plan sector also deserves a close look. In several of our programmes the whole direction has changed and what was relevant 10 years ago is no more relevant. But the staff is there and expenditure is being incurred and things are going on as usual. For example, on the animal husbandry side individual bulls are being kept or 2 to 3 bulls stationed at various places in each state. Today we have agreed that frozen semen technology shall be used. This requires one common bull centre and a nitrogen plant. A little more capital investment in nitrogen plants will enable our states to do the work much more effectively than all the bulls they have got. Similarly, in fisheries, we have agreed on induced breeding system which is absolutely necessary for composite culture. On the other hand, most of our stock is of doubtful quality. We should select pure breed, in which case the number of centres required will be 2 or 3 at the most in each state. With efficient management it can become a completely commercial proposition. In agriculture, a 25 acre seed farm has no relevance today. There is a minimum size for a farm which is necessary for efficiency. It is time for the states to have a close look at their schemes and weed out those which have become obsolete Maharashtra has already done it and cut out many of its schemes If others also do that and pay attention to some of the programmes which have greater growth and employment potential, progress will be much more rapid than what has been in the past

It is necessary to develop the perspective over the next five years. Our previous practice has been that each state develops its own targets according to its capacity and then we have a common get-together Normally the figures we agree to are those which we feel are necessary for the whole country These adjustments can be made later. For the four years, 1979 to 1983, the details will be worked out after the discussions in April-July when the budget is cleared. There is no need to be agitated at this stage about what is called 'rolling plan'. The further niceties of rolling plan would be left to the mathematical experts who will handle it in the planning division

BEST USE OF LAND RESOURCES

Coming to the programmes which are of vital interest from the objective of higher production coupled with employment, agriculture comes first In agriculture, there is irrigated agriculture and rainfed agriculture. For irrigated agriculture, we have got the command area development programme on which the package approach is being adopted. Even now I find control of irrigation is lacking and the cropping programmes have not been adjusted to the principles stated both in the irrigation commission's report and *that of the national commission on agriculture* (NCA) I would also draw attention to the NCA's recommendations about production. The targets envisaged in 2000 A.D. can be achieved by reducing the area under wheat or rice and most of the cereals and extending the areas under pulses, oilseeds, etc. We hav

to put the available land resources to best use. The states will have to build this approach to crop planning into their system. This does not require money; it only requires scientists getting together with extension workers.

In this context, I would suggest that the first thing to be done is to introduce what is called the 'benor' system of extension with suitable modifications. This is the key to the whole system and this depends on discipline, supervision and subject-matter specialists. So, next year we start building up cadres of these officers. Water management specialists and farm management specialists are absolutely essential at the district level. The farm management specialists must be experts in mixed farming. Plant protection expertise is very poor. So, in consultation with universities and other training institutions, we have to impart the necessary training and build up the cadre. All this should be done from now onwards so that at least by next kharif we are able to cover a reasonably widespread area for agricultural development.

Water-shed Management

Regarding rainfed agriculture, I think we should now accept that water-shed management holds the key. Gujarat has certainly done very well in it. I had suggested to Gujarat that I would like to see a water-shed management programme for one mini water-shed in each block in 1978-79, thereafter three and the year after that six and then nine. In this way, we can advance from year to year as our expertise gathers momentum Then, at the end of five years, more than half of the rainfed area will be covered by managed water-shed. States which have not really tackled this problem should now try to build up the expertise and train their personnel. All the soil conservation men will have to be trained in the new technology. Foresters, animal husbandry men and agricultural experts will have to be trained to plan this. This itself will be an integrated development approach.

So, if the states have understood water-shed management, they will automatically understand integrated development in agriculture. But it will take some time. I have requested the concerned ministry to see that necessary training programmes are organised quickly. The idea is ancient. With the same money you can start off next year doing a much better job. It is really organisation, training and deployment of the right type of people. Money is not required for this, except marginally. Whatever is required must be fitted into this comprehensive programme.

In regard to the actual cropping system, I would like everyone to consider seriously the actual market situation in each state. For example, Gujarat may feel that they must grow more paddy. But a situation has come when we are able to free the paddy market for the whole of the country. This could not have been done unless there was some sort of understanding that this has come to stay. This means that our rice production is stabilising itself. So a high cost paddy production does not fit into the picture Similarly, a high cost wheat production does not fit in. The farmer may not know it. It is up to the states to give him alternatives about various crops linked with needs. This exercise will be a continuing one during the next five years. For example, Kerala is not able to consume all its tapioca. Meanwhile, we are extending tapioca production in Tamil Nadu and also asking the north-east of this country to increase its tapioca production We have to think very seriously whether we are going to export tapioca or use it for animal feed for the development of animal husbandry. These are all problems that are arising and it is time that all give thought to it.

Milk Programme

Now, on the animal husbandry side, there is need for a close look at two important programmes : one is milk production and the other is sheep production. For milk production, we have operation flood phase I and after about seven years of working, according to available figures, we have covered directly about 6.8 lakh animals out of which five lakh are in Gujarat and the rest in other parts of the country.

Regarding operation flood phase II, it is expected to cover about four million animals in the next five years. I think that is a target that we have accepted I think it is time to see to it that principles are evolved for operation flood, that is, the primary cooperatives of producers linked to a union which can initially be a body with nominated directors. Agreed principles have already been evolved, but somehow there is an internal conflict between the animal husbandry department and operation flood in the cooperatives and things are not as satisfactory as they should be. Gujarat has moved ahead, because the principle has been observed.

As a parallel programme, we are also encouraging the Urlikanchan foundation, Bharatiya agro-industries foundation we will be taking up block schemes in selected areas. We will select some areas where the cross-breeding and fodder programmes, which are basic to milk production, are in operation. Operation flood concentrates more on the end product, that is, milk and its after use. So, we have to find a tie-up between the two at some stage But we are also thinking very seriously about milk marketing itself. This deserves attention as well. The system must enable milk to be distributed in the areas of production, in the small townships and also milk products will have to be produced which will be of use for general consumption. Cheese is certainly good, but it is for special consumption ; *khoya* is for general consumption. I think that instead of pasteurising the milk, it can be heated to the boiling point and cooled; it will have better keeping quality and can be distributed to the local areas without difficulty. As regards frozen semen technique, I think one bull centre is enough for every state with a nitrogen plant and what is called a libarary of semen. I think we have provision for giving each state a herd of exotic cow so that future bulls can be developed. It is part of the fifth plan. But it has not spread much. We are also building into it what is called the progeny testing o the bulls. Now, I would like to see that this is buil into one system. Naturally, animal husbandry depart ments will have to be strengthened and the nationa commission on agriculture has suggested that ther must be subject-matter specialists in animal hus bandry at the district level. There is a central secto scheme for this also. I do not think many of th states have taken advantage of this scheme for th simple reason that they have not got the experts. So this is another sector where the states should have look at the expertise available, the type of subjec matter specialists that will have to be brought in s that necessary action is taken before the next seaso

Sheep Rearing

The other important programme which I ha already referred to is sheep rearing. There is a b

market for sheep meat; please do not get into the wool syndrome because that yields limited benefit to the sheep breeder. His main income comes from the sale of meat. Even from the best of marinos, it is the yield of meat that matters. So I would suggest a look into the cross-breeding programmes from these aspects and link it up with some system of fodder development. I had been to Bihar recently. Madhya Pradesh and Rajasthan have got areas where fodder development is more profitable than grain development and recently in Kutch, the Satguru Sewa Sangh Trust has developed certain fodder trees, particularly what is called '*ku babul*' and also 'tree lucern'. Even with the scarce water supply quite a lot has been done and some of these will be best suited for the marginal scrub jungles, where we can introduce fodder trees without much difficulty. It is also suitable for panchayat lands where nothing is growing at present. Protected forests can be reserved for afforestation with these fodder trees and certain rights on identified areas can be given to the poorer families who should look after the trees and gather the fodder which will be fed to the animals being developed under the animal husbandry programme by the poorer families within the village. Then, the milk programme will become an important part of the income generation programme, particularly for the poorer sections and will increase their employment.

Thus, a very aggressive programme of farm forestry and social forestry with cross-bred animal husbandry programme can be evolved. Immediately, the problem of availability of cows may arise. We have been buying cows in the market under various schemes at high cost. One important thing which Urlikanchan system has shown is that they can produce a cross-bred heifer out of a cow going to the butcher and priced at Rs. 50. Quite a lot of cows of no value today can acts as incubators for the cross-bred. I think this has been discussed in the NCA report also but has not received much attention. So, I would like all to pay special attenntion to this programme. As regards social forestry and farm forestry, this is a central sector scheme and I hope it will continue next year also with greater funds.

Now, the same fodder can be utilised for sheep also and there is a pressure that goats should also be looked after. There is no particular objection if stall feeding of goats can be had and this can be done if we can grow fodder trees and ensure cutting of branches and then offering these to the goats instead of goats trying to take these themselves. The forester would also allow this. There can be a discussion with the foresters. But the first thing is about growing the fodder trees. Pasture development can also be done.

The sheep programme will be useful. But marketing is a problem and special marketing expertise will have to be built up. Marketing experts will have to be found. These two programmes should be launched during the next two years.

Fisheries

Then, coming to fisheries, about two or three centres per state will be more than enough for supplying all the seed for composite fish culture. We can distribute the seed or the fry to far off centres in oxygen bags and can then develop it in the areas planned for stocking locally. Fishermen can be involved in the development of the fry from the seed or from small fry and selling it locally. In West Bengal with brackish water, about 50,000 poor families are now earning a livelihood catching the brackish water fry from the streams and then selecting out of them the good fry and selling it to fishery owneds. Similarly, we can develop quite a lot of fishermen families in the interior by linking it to the induced centres. There is an employment aspect to this.

Composite culture is not possible unless the tank is properly renovated and whoever does it should get a long-term lease. But I have noticed that single year leases are given, auctions are held, tanks are not given to fishermen on a long-term basis.

Commercial Forestry

Unfortunately, the whole concept of commercial forestry has not been properly understood. I would suggest an early get-together of the forest officers with the experts in the ministry of agriculture so that the institutional resources could be drawn upon. Madhya Pradesh, for example, should have a very aggressive programme of forests and necessary institutional finance should be utilised. Another aspect of forestry as a provider of employment has not received adequate attention. The report of the Hyderabad Institute indicates that foresters are not using local people for any of their operations. They have let out all the operations to be carried out by contractors and contractors bring their own labour from outside. In fact, forests have been exploited by rich people who bring their own people. This has to be looked into.

During the last three years we have been offering money to state chief conservators for plantations. But use has not been made of the funds in an adequate manner although we are prepared to give more money. It needs to be examined as to what is happening and where capacity to do things is lacking. Is it the lack of officers and the staff to do it? I feel that rangers have not yet been trained. The staff should have a close look at what they have programmed for five years and whether this is sufficient to give employment and support the animal husbandry and farm requirements. There are not sufficient centres in the country for training of rangers, because it was thought that it could be controlled from Delhi.

Then, we have to think about extension forestry. Sheesham and farm forestry are important. The other day in Bihar I was in Purnea. In the Kosi canal system, Sheesham plants have been grown on the bank of the canal. Within 10 years they have already grown well and in 25 years each tree of Sheesham will be worth Rs. 750 to Rs. 800 at the present price; what the price will be 15 years later we cannot say. Sheesham should be planted wherever possible. Sheesham forestry and farm forestry are certainly employment-oriented. I suggest to all the states to have a look at this also, and see whether they can include this in the plan.

Integrated Rural Development

Now, I come to the integrated rural development programme. I must draw attention to the emphasis being laid on rural development by the new government and its commitment to achieving full employment within a period of ten years.

In India, we have experimented with a number of strategies of rural development and certain norms and acceptable parameters have now emerged. We have beneficiary-oriented programmes like SFDA/MFAL with a major emphasis on the development of weaker

sections. On the other hand, we have area programmes like the drought prone areas programme and the command area development programme, the emphasis of which is on the development of the 'area' subject to weaker sections being enabled to take full part therein. The drought-prone areas programme incorporates elements of area development approach as well as the weaker sections development approach. Under integrated rural development, it is proposed to integrate the area development and weaker sections development approaches under one programme and implement it as a package to achieve the twin objectives of rural development and full employment which is now the goal set before the country by the present government. As the emphasis is on decentralised planning, it is proposed to give much more freedom of operation at district level within accepted norms and parameters worked out during the past years. The programmes at the district level will be formulated realistically taking into consideration the local resources and needs. The programme has to be well thought out and will have a five-year perspective.

The mix of programmes envisaged under IRD programme will have normally the following components in most areas : (i) crop production; (ii) animal husbandry and dairying; (iii) poultry; (iv) piggery; (v) sheep rearing; (vi) fisheries; and (vii) village and small industries programmes. The financial requirements for these programmes should be met from different sources—centre, state and institutional finance—and should be put under one budget head if possible. In this connection, I would like to mention that in tribal development in the states all projects have been put under one major head with sectoral sub-heads under the control of one secretary. It could be examined whether a similar system could be adopted for the IRD programme also. It is proposed to give a lump sum amount from the centre for implementation of these programmes and a similar approach is proposed to be followed in respect of the states share of the plan. Details regarding criteria to be used in making *inter-se* financial allocations in respect of districts are being worked out and the states will be informed as soon as this exercise is completed.

Micro-level Planning

As regards micro-level block planning, it is proposed to cover about 50 per cent of the blocks in the country for full employment within the next five years and a beginning has to be made next year itself. For this purpose, much more detailed exercise will be required to be done. After identification of the number of families coming within the disadvantaged group or the weaker section etc., suitable programmes will have to be formulated. As a first approximation all the blocks now under SFDA, CAD and DPAP will be covered for a full employment approach in three or four years. It is also proposed to cover about 300 new blocks during 1978-79 for detailed block level planning for full employment and the states may work out their share on a *pro-rata* basis and take up some blocks for detailed planning immediately.

We have to follow a very selective approach. The programmes to be taken up should fulfil growth and employment objectives. The impact of some of the earlier programmes was not very definite and, therefore, both the plan and non-plan programmes which are non-productive or obsolete need to be weeded out.

I would like to emphasise the need for reorganising and bringing all extension work in the area of agriculture and rural development under one umbrella. For employment planning and manpower budgeting, after the programmes are formulated at the block or district level, a situation may arise where not enough labour is available for the execution of works. This may appear as a strange phenomenon in the Indian context facing large unemployment but it is a problem which may arise for which states will have to find appropriate solutions.

Corporation Idea at District Level

I would like to give thought to the need to have an appropriate agency at the district level which has the necessary administrative and financial authority for implementation of IRD programmes. States already have some experience under SFDA, DPAP and CAD programmes and these agencies have been working well. We should think over the types of agency to be set up.

I would like to emphasise here the need to explore fully the possibilities of providing self-employment in the tertiary sector. In this context, I may mention that we have had some experience under the PIREP and growth centres schemes. Available skills have to be utilised and necessary training provided for upgrading the skills. Problems of rural poverty and unemployment can only be solved by creating employment opportunities in rural areas and ensuring fair remuneration for labour. It is also essential to have institutional arrangements for input supply, credit, marketing, development of village and small industries etc. The multipurpose viable cooperative societies should be the answer for financing different activities envisaged under IRD plan which will also be a safeguard against the exploitative system. The credit system will have to be made more elastic with the necessary tie-up with different programmes.

The new approach to planning also envisages much more active involvement of voluntary organisations and this will not be a once for all involvement but continuous participation by these organisations in the planning process, the formulation of block level plans as well as their implementation.

I may also refer to the scheme of the government of India to involve industrial houses in rural development programmes. The Bharatiya agro-industries foundation has done very good work in the animal husbandry programme. Likewise negotiations are in progress with Hindustan Lever for their involvement in the fisheries programme which still remains weak. It is proposed to involve the industrial houses in areas requiring high level technology.

I would like to stress at the end that as the preparation of detailed action plans for integrated rural development, based on comprehensive resources inventories, is taking unduly long time, some obvious programmes which would find place in any scheme of integrated rural development of the area have to be identified for immediate implementation. In view of the highest priority given to rural development and full employment, the government are determined to go ahead with the implementation of programmes to fulfil the national goal, instead of waiting indefinitely for resources inventories as envisaged earlier. □

SIDE TRACK

Students' Involvement in Relief Work

HUNDREDS of National Service Scheme volunteers have been involved in relief work during the floods that revaged various parts of the country recently.

At Kharagpur, the Kangsbati canal, running close to the Indian Institute of Technology campus, was swollen by overnight rain, overran its banks and threatened about 500 people living in mud huts. A contingent of about a hundred volunteers of the N.S.S. unit immediately left for the area under a teacher-in-charge on receipt of the news. They cleared the nullahs, repaired the huts and baled out water accumulated in the courtyards. The relief operations continued for well over a month. The boys also helped the affected people with clothes and money.

In the lake areas near the Samdhar-Phulera road in Rajasthan, the menace of the rising waters was compounded by further heavy rain. About two hundred students of the Government Colleges at Shakambhar and Nagpur got down to digging channels to drain out the water and piling sandbags to save the residential areas While keeping vigil, they distributed clothes, food and medicine to the affected people.

Cutting Field Channels

In Midnapore district, the muddy turbulence of a number of rivers like Kas-oi, Silabati, Porang and Kupai spilled over into nearly a thousand square kilometres of paddy fields Students of the local college, with the help of local farmers, laid out field channels, saved the crop and kept up a supply of food and medicine.

In the villages of Bireshwarpur and Khelaampur, the N.S.S. volunteers were joined by the local block staff, as they went about laying cement concrete pipes to drain out water.

The supply of life-saving drugs and food was a recurring theme in such activities. The N S S volunteers of the Sabang Sajani Kanta Mahavidyalaya in West Bengal did not stop with saving about two hundred and fifty families, most of them belonging to scheduled tribes as the river Kalanji crossed the danger mark They helped the medical staff in taking prophylactic action against cholera and small-pox

In Delhi University, Shivaji college students took up flood relief work on the Najafgarh drain by laying sandbags. A number of other educational institutions of Delhi like P.G.D.A.V. college, St. Stephen's college, Delhi college of engineering, Indian institute of technology, Bhagat Singh college, all-India institute of medical sciences, Jawaharlal Nehru university and Jamia Milia university also took up the challenge posed by the floods.

Food, milk and medicines, contributed by charitable organisations, and also by students themselves, were ferried across to marooned villagers, many of whom had sought shelter on the branches of trees. As stranded people in Dharampur, Najafgarh, Nangloi, Raja Garden, Jahangirpuri and other villages were moved to safety, they were provided with food and temporary shelter.

In Haryana, the N.S.S. unit of S.A. Jain college sent nearly 1,200 food packets to the suffering villagers through the district authorities, besides 40 kgs. of flour and bundles of old clothes for those rendered destitute. Interns of the medical college at Rohtak formed themselves into groups to serve over 200 villages in Rohtak and Sonepat districts. Twenty-two other colleges came forward to give assistance in cash and kind Twelve thousand rupees in cash, 7,500 pieces of cloth, 5,000 kg. of foodgrains and about 3,000 food packests were distributed for the use of the flood-hit Haryana agricultural university students offered the services of its vets for the protection of animals.

IGNORAMAN

Wants to know

Whether there is scope for a new party to be called "Emergency Party or "Sterilisation Party" or "Democracy Derailment Party" or "Midnight Requisition Party.

In Assam, N S S. units of Gauhati University were pressed into service. Volunteers of Tangla college tried to divert the course of the river Novoi by digging up a canal but failed At Thangaldoi, students helped in transferring families and distributing rations. N.S.S. volunteers also extended their assistance to local authorities in relief operations following the train disaster at Kahabari on the Rangia-Fezpur railway line.

In Karnataka and Orissa

Down south, in Karnataka university, students of Shri Thanjuvateshwar college at Honnavar involved themselves in raising funds for the flood-hit, particularly Harijan families. At Ramadurg, students of C.S. Bembalji arts and science college raised about five hundred rupees for distribution among the affected people At Hubli, S J.M.V. arts and commerce college, Nehru arts, science and commerce college, J.G. college of commerce, P.G Jabin college of commerce and Kadasiddeshwar arts and H.S. Kotambai science institute launched a combined programme of assistance and ran up a total of over four thousand rupees in cash for this purpose.

In Sagar University, students of Narmada Mahavidyalaya kept a round-the-clock vigil at Hoshangabad, Madhya Pradesh, to warn the residents against floods. In Orissa, university students set up a camp to assist farmers in agricultural operations and to vaccinate cattle. In Uttar Pradesh as flood waters reached out to nearly twenty districts, N.S.S. units in the universities and affiliated colleges were alerted for relief work. In Barsana, Mathura district, students undertook construction of kaccha bunds for protective purposes. Prophylactic measures for livestock were taken up by students of the college of veterinary science and animal husbandry, Mathura.

Goals of Rural Oriented Planning

—DR. P. S. PANDEY

ACCORDING TO the 1971 census India had only 20 per cent urbanisation which means that 80% of India's population in 1971 lived in the villages. In Europe, 80 per cent of the population lives in cities while only 20 per cent lives in villages. If we analyse the composition of the labour force, the picture in India looks more dismal. Of the total working population in India, 72 per cent is engaged in primary industry, that is, agriculture, animal husbandry etc. Only eight per cent of the total labour force in North America, 28 per cent in Europe and 45 per cent in the Soviet Union are engaged in agriculture. The percentage of the working population engaged in secondary industry, that is, manufacturing, in India in 1961 was only 12 while in America and Europe it was 39 and in the Soviet Union 28. The percentage in tertiary industry (service and trade) in India in 1961 was 16, in America 53, in Europe 34 and in the Soviet Union 27.

While there was 92 per cent industrialisation in America, 72 per cent in Europe and 55 per cent in the Soviet Union there was hardly 28 per cent industrialisation in India around the year 1967. Comparing India's case with the developed countries in the west, we find that with 20 per cent urbanisation these countries had over 50 per cent of their labour force engaged in secondary industries. This is the state of our backwardness. Even with only 20 per cent urbanisation India is supposed to be over-urbanised because, (1) this urbanisation is not backed by adequate industrialisation and (2) it is mainly the result of the rural push-unemployed, that is, hungry and poor people migrate to the cities in search of jobs.

Planning in India right from the beginning has been on the wrong track. It is obvious that large scale industrialisation which is mainly labour-saving cannot solve the problem of rural unemployment. Our problem is not only to modernise our economy symbolically and to show to the world that we too have large industries, international airports and big units, sprawling metropolitan centres and are thus entitled to take our seat in the comity of developed nations of the world. We have on the other hand to deal with the gigantic problem of ensuring a fairly decent standard of living to the 80 per cent of the people living in the villages along with those unfortunate ones who have migrated to the cities and are without a job, without a home and without a roof over their heads

RIHGT PRIORITIES

The Janata Party in its election manifesto has given top priority to agriculture, agrarian reform, development of small-scale and cottage industries and promoting a healthy rural-urban nexus. The crux of the rural problem is the under-employment of the working force engaged in agriculture. Our agriculture is unfortunately neither labour extensive nor labour intensive. Our large population and man-land ratio rules out labour extensive agriculture. This rules out labour intensive agriculture too. For there are too many hands in our villages than there is land for cultivation. The mistake that the previous government committed over the years was to depend on large scale industrialisation and family planning as the stock solution to the problem of rural unemployment.

One of the basic strategies of our plan in Uttar Pradesh should be to divide the state into regions according to the specific natural characteristics of the areas and to locate centres of industrial growth. The government should give full scope for the growth of local innovation and entrepreneurship. At the same time efforts will have to be made to build up infrastructure for the development of village industries. Basically, the tasks in rural development are : (a) to increase agricultural productivity, (b) to improve storage and marketability of farm produce, (c) to improve the generation of power and strengthen its distribution and (d) to decentralise the entire process of planning so as to make the people feel that schemes are not imposed on them from above but are formulated and implemented with their active cooperation and consent. The essential requisite for agricultural output is the availability of the right inputs at the right time and, of course, at the right price.

The construction of roads, bunds and bridges, primary schools and health centres should be intensified in order to prepare the infrastructure for rural development and also to reduce the level of unemployment in the villages. Extension and training services should also be made available to the rural people so as to enable them to understand and appreciate new farm technology Orientation programmes should be sponsored for groups of farmers in the correct use of available inputs and the adoption of modern farm practices

BRIDGE URBAN-RURAL GAP

It should be our endeavour to integrate the village communities with the cities in a way that each may promote the other's interests and there is no unnecessary gulf between the two If we can create adequate job opportunities in the villages, which we can, the drift to the cities will be arrested. Similarly if the villages can produce consumer goods to cater to the needs of the cities, the cities will become a potential agency of rural development. In the western countries there is not much difference between the villages and cities as far as physical amenities are concerned European villages have pucca roads and well-built cottages and a fair measure of the modern amenities which are available in urban households. In certain respects the villages are economically better off than the town dwellers. At least the villagers live in separate cottages while the urban people have to live in flats which form part of multi-storied buildings shared by many. In India there is a world of difference between the cities and the villages in respect of physical amenities. This difference must be minimised and the villages brought nearer to the cities This should be another objective of a rural-oriented development plan.

Role of the Reserve Bank in Agricultural Credit

G. P Bhave

AMONG THE central banks of different countries in the world, the Reserve Bank of India plays a significant role in agricultural credit, both in absolute and in comparative terms.

The functions of the Reserve Bank in the sphere of agricultural credit could be divided into : (1) regulatory and financial functions, and (2) promotional and developmental functions. It makes available credit limits for the following purposes at different rates of interest, its loaning to the priority sectors being at a concessional rate : (1) seasonal agricultural operations, (at one and a half per cent below the bank rate), (2) marketing of crops including cotton and *kapas* (at three per cent above the bank rate), (3) purchase and distribution of fertilisers (at 3 per cent above the bank rate), (4) short-term loans to agricultural refinance and development corporation (at bank rate), (5) medium-term loans for agricultural purposes (at one and a half per cent below the bank rate), (6) conversion of short-term loans into medium-term loans in scarcity affected areas (at one and a half per cent below the bank rate) from the agricultural credit stabilisation fund, (7) medium-term loans for purchase of shares in co-operative sugar factories/processing societies (at bank rate), (8) loans to state governments for contribution to the share capital of co-operative credit institutions (at 6 per cent) from long-term operations fund, and (9) long-term loans to agricultural refinance and development corporation (at 6 per cent).

Regulatory Functions

As far as regulatory functions are concerned, the co-operative banks are now within the purview of the banking regulation act, 1949 (as applicable to co-operative societies). As such they are governed by the norms and disciplines pertaining to the quantum, terms and conditions of certain types of advances as well as permissible volume of loan outstandings against certain sensitive commodities which are susceptible to price rise. As financer, the role of Reserve Bank in the sphere of agricultural credit has considerably increased as would be seen from the fact that while in the year 1950-51 the Reserve Bank sanctioned credit limits for seasonal agricultural operations to the extent of only about Rs. eight crore, for the year 1976-77, the total limits sanctioned for this purpose were Rs. 696 crore. The increase in the total limits sanctioned has been specially significant since 1972-73 mainly due to factors like increased cost of agricultural inputs, programmes of universal membership and steps taken to regularise the co-operative credit structure. These limits have also a bearing on the total loans and advances by the co-operatives for short-term agricultural purposes (presently about Rs. 1,100 crore), the Reserve Bank limits being of a supplementary nature. The operation of the Reserve Bank's credit limits is subject to certain important norms like the maintenance of non-overdue cover, performance of the co-operative banks in making at least 20 per cent of their advances to small farmers and weaker sections, maintenance of seasonality in operations on the credit limits and mobilisation of deposits.

There has not been much progress in the development of co-operative marketing and processing and hence limits sanctioned during 1976-77 amounted to only Rs. nine crore. Marketing credit is available from the Reserve Bank only to the extent of recovery of co-operative dues by linking production credit with marketing. For purchase and distribution of fertilisers also, after the consortium of commercial banks decide upon their share, supplementary requirements are met by the Reserve Bank.

Support to Debenture Schemes

In the sphere of long-term agricultural credit, the Reserve Bank's role is mainly that of a co-ordinator in the sense that it organises support to the debenture programmes of the land development banks whose main responsibility is to disburse investment credit for minor irrigation, agricultural machinery etc. Besides, medium-term limits for pumping sets, milch cattle, etc., are made available at one and a half per cent below the bank rate, the total limits for the year 1976 sanctioned being Rs. 15 crore. Such medium-term loans are also subject to the same discipline as schematic loaning, for example, arrangements for collection and marketing of produce. The grant of medium-term conversion loans at one and a half per cent below the bank rate is related to the existence of scracity conditions in specified areas affecting the cultivator-member's ability to repay his short-term loans.

Apart from statutory inspections, the Bank has been conducting special studies like those of overdues, and of special problems in states of Madhya Pradesh, Uttar Pradesh, Bihar and Rajasthan. Recently, the Reserve Bank has initiated a scheme for intensive development of selected districts under which special officers are alloted by the Bank to work in full collaboration with the co-operative and commercial bankers as well as government officials in the districts to fomulate bankable local schemes and prepare concrete action and credit programme for each of the 41 seleced districts

To sum up, the Reserve Bank has tried to bring about in its policies as well as working methods a suitable blending of both regulatory and financial functions as well as promotional and developmental functions and has been trying to play its role as a coordinartor too.

A Case For Small Capacity Granulation Plants

DR. SATYENDRA VARMA
and
D. P. VASUDEVA

ABOUT tw[illegible]-five per cent of the total area under cultivation has assured irrigation and accounts for [illegible]5 per cent of the total consumption of fertilizers in the country. Even in these areas, annual fertilizer consumption amounts to only around 27 kg of plant nutrients per hectare while the national average is about 17 kg/ha of cropped area. These figures are well below the world average of 57 kg/ha and still lower in comparison with some individual countries For instance fertilizer consumption for 1973-74 in China, Egypt, Israel, France and South Korea was 45, 161, 136, 311 and 317 kg/ha respectively. Of a total of 380 districts in the country, 44 districts consumed about 40 per cent of total nutrient during the year 1974-75.

THE IMBALANCE

All the primary nutrients—nitrogen, phosphorus and potassium—are essential for plant growth. Any deficiency of one of them will be a limiting factor in agricultural production. The general practice in India is to apply NPK nutrients as basal dressing followed later by a nitrogenous fertilizer for top dressing. For optimal agricultural yield and soil fertility, the ratio of nutrients and their doses must meet agronomic requirements. Amongst the factors affecting fertilizer efficiencies, unbalanced fertilizer application is rated as one of the most important factors causing low agricultural productivity in India. A striking feature of the Indian science has been that the consumption of P_2O_5 and K_2O is significantly less than the consumption of nitrogen. The prevalent nutrient consumption ratio 7.5:1.7:1 far exceeds the recommended overall ratio of 4:2·1 and is much at variance from the world average figure of 1.9:1.2:1. The abnormal emphasis on nitrogenous fertilizers is a general trend not restricted to a particular region or state. To what extent the ratio of nutrient consumped is due to the low level of nutrient application is not known But it appears that the level of application of P_2O_5 and K_2O is largely determined on the consideration that these nutrients do not become the limiting factor in the agricultural productivity ignoring the advantage of interaction effect of nutrients. Hence besides the total consumption of nutrients, the relative consumption of both P_2O and K_2O needs to be stepped upto improve productivity.

AVAILABILITY OF NPK

The various nutrients available internally and from imports during the year 1975-76 are indicated in Table II. It is significant that only 11 per cent of the total nutrients available are from NPK complex and compound fertilizers. The includes 0.28 million tonnes of imported fertilizers during the year 1975-76 in which the grades 15-15-15 and 17-17-17 predominated. The Indian mixed fertilizer industry supplied NP/NPK fertilizers through its 41 granulation units and nearly 500 mixing units. These units are of small capacity, mostly in the private but some in the cooperative sector. Capacity utilisation is low and variable, depending on the availability of raw materials at the right time and on profitability considerations. These units are also unevenly distributed. Whereas the mixing units are largely concentrated in the southern region of the country, most of the granulation plants are located in the western and central regions. Only a few granulation plants and mixing units serve the northern and eastern parts of the country, with the result that the availability of balanced fertilizers still presents a problem.

Fertilizer consumption projections carried out by the Fertilizer Association of India recently envisaged an increase in the consumption of total nutrients from 3 54 million tonnes to 7.49 million tonnes in 1983-84, an increase of 126 per cent in the consumption of nitrogen, 66 per cent for P_2O_5 and 96 per cent for K_2O from the projection levels for 1976-77. Thus the projected pattern of nutrient consumption ratio is not markedly different from what it is at present. For balanced fertilization and to ensure efficient use of nutrients it is necessary to improve the supply and distribution of NPK fertilizers. This is possible when a larger proportion of nutrients is supplied in a single package.

THE ALTERNATIVES

The alternatives available for this are : Dry blends, complex and compound fertilizers and mixed fertilizers in granular form.

Though dry blends of pulverised fertilizer materials are a convenient and economical way of supplying balanced nutrients to the farmer, they have disadvantages. The difficulty in providing a product of standard quality and composition is a serious handicap Moreover segregation of constitutents leads to nonuniform distribution of nutrients in the fileds when applied annually This leads to inefficient use of an already limited fertilizer input. Therefore, in any advance planning, this mode of supply of materials to the soil should gradually be replaced by NPK granular fertilizers and by NPK complex/compound fertilizers.

The sucess of bulk blends in the United States has drawn keen interest in granular blends as a means of supplying multi-nutrient mixtures to the soil. The raw materials used are in granular form with matching particle sizes to prevent segregation and to ensure a better quality of the product. Use of DAP in blends gave a further glip to their popularity in the United States, as the high nutrient content of the blends reduced further the unit cost of plant food The success of bulk blends in the United States is due as much to the package of services offered to the consumer, with precautions taken to avoid segregation during transportation and placement in the fields, as to the blend itself. Furthermore, blends have been made even more attractive by the introduction of granular potash (KCl) and granular urea to match the size of DAP, while bulk spreading facilities have obviated the necessity of bagging the fertilizers, thus further reducing the cost of delivered nutrients. In India, now or in the near future, it is difficult to adopt such a practice without radical changes in farming techniques Non availability of raw materials of matching sizes is another factor that must be taken into account while examining the feasibility of adopting granular blends for supplying balanced fertilizers to the soil.

Large-capacity complex and compound fertilizer plants are capable of providing high-grade fertilizers of selected standard nutrient ratios economically These multinutrient fertilizers would serve the regions whose agronomic requirements match the ratios and grades produced by a particular plant. For historical reasons, the growth of the Indian fertilizer industry has centred round the production of ntrogenous fertilizers The expansion of the industry with respect to complex and

npound fertilisers has not kept pace with the increase in nitrogen capacity. In the year 1975-76, out a total of 22 fertiliser plants producing nitrogenous tilisers, only eight produced, in addition, NP and 'K fertilisers. The restricted choice of formulations 1 grades obtainable in such complex fertiliser plants a disadvantage, and this is a major consideration India, where the objective is to use the available .rients as efficiently as possible to meet widely vary-, agronomic demands. Expansion of this sector, wever is necessary to meet the growing demand for ndard grades, as indicated by the fact that considere quantities are at present imported.

Small Capacity Plant

In order to increase the efficiency of fertiliser input, it application of total nutrient requirements is inasingly being advocated to minimise nutrient loss aching, volatilisation and denitrification) and to satisthe peak stages of fertiliser requirements. There is, refore, an added justification for making NPK forllation designed to meet the agronomic needs of rescted areas. This can be achieved by granulating solid v materials to produce NPK fertilisers in a small pacity granulation plant catering to the need of an jacent area. Several such units, functioning as relers, supplying directly to the farmers would improve distribution network and would ensure increased ailability of NPK fertilisers to the users These units ly also provide other services to the farmers, for ample, arrangement for soil analysis on the basis of ich fertiliser formulations are made and supplied iese units can also supply micro-nutrients and pestiles, wherever necessary In short the concept of escription application of fertilisers would have to be imately accepted. The conventional process of granuion in a rotary drum with provision of steam to uti- high temperature coefficient of solubility of nitronous fertilisers to generate adequate liquide phase for inulation followed by drying is preferably owing to simplicity of the process and flexibility with respect the wide range of formulations, grades and ratios of trients produced The optimum size of such a plant suring fair return on investment has been found to 5 tonne an hour or 36,000 tonnes a year The eak down of cost is given in Table I. The granulation st (including packaging) for a plant of such a capay is estimated to be around Rs. 200 per tonne of 'K fertiliser produced and would employ over 100 rsons including graduates in science, engineering and riculture.

Raw Materials

From the point of view of availability of raw materials granulation plants it is evident that urea occupies dominant position amongst the nitrogenous fertilisers. digenous production of urea as well as imports, are in excess of other fertilisers (Table II). Among the ligenous phosphatics, single superphosphate tops the t.

Urea and superphosphate are however incompatible, ey can neither be mixed nor granulated together nmoniation of superphosphate renders it compatible th urea, but in this process the water-solubility of O_5 is significantly reduced. This is a serious limitan, as many of the state governments insist on having higher proportion of P_2O_5 in water-soluble form in 'K products. Calcium ammonium nitrate, too, prents a problem to granulation plants when used along th superphosphates, as the presence of limestone

Table I: Cost of Granulation (Including Packaging)
(Production 36000 Tonnes/Year)
(based on Pilot Plant data)

Erected Cost of the Plant — Rs. 78 94 lakh
Working Capital — Rs 88 39 lakh

		Annual Cost, Rs. *Lakh*
(A) Variable cost		
1. Coating agent		2.88
2. Utilities		7.50
3. Material handling		[illegible]
4. Bags		25.60
5. Contingencies	@ 5% of 2 to 4	1.88
Total variable cost		42 45
(B) Fixed Cost		
6. Labour and overheads		5.4[illegible]
7. Consumable stores and maintenance materials	@ 3·5 % of Rs. 78 94 lakh	2.77
8. Insurance, taxes, and contingencies		0.84
9. Depreciation	@ 10% of Rs. 78 94 lakh	7.89
10. Interest on working capital	@ 14 % of Rs 88.39 lakh.	12.37
Total fixed cost		29.27
Annual cost of granulation (A) + (B)		71.72

(This works out to less than Rs. 200 per tonne of granulation including packaging)

causes reversion of water-soluble P_2O_5 to an insoluble form during processing and storage. Limited quantities of ammonium sulphate-nitrate and ammonium chloride are available and are used mainly for top dressing. The extent of use of these materials to the production of NPK fertilisers is limited and of little consequence. Thus the compatability factor reduces the choice of raw materials. Ammonium phosphates and urea are, however, compatible Mixed fertilisers of high nutrient content would be available, from Urea, NAP or DAP and potash. The super phosphate, however, can be used with ammonium sulphate and potash to produce low-nutrient formulations.

As urea is at present and is likely to remain in future, the predominant nitrogen carrier, its use in NPK fertilisers is essential. For any effective use of urea, new capacity would have to be built to provide ammonium phosphates both for captive use in making NP/NPK fertilisers and for distribution as raw materials for granulation plants. Mono-ammonium phosphate with its superior keeping quality, greater thermal stability and comparable high nutrient content has distinct advantages over di-ammonium phosphate as a PO_5 carrier for NPK granulation. Till indigenous capacity for ammonium phosphates is built up, these may be imported, specifically for use in granulation plants. In the Indian context low-analysis NPK fertilisers, based on superphosphate along with ammonium sulphate and potash, would continue to play a complementary role towards supplying balanced nutrient to the farmer thereby using available superphosphate capacity. To start with the granulation plants may be located in districts which have a low nutrient consump-

pn level, but have a sizeable proportion of their cropped area under assured irrigation. Over hundred such districts have recently been identified for implementing the government plan for intensive fertiliser promotion. The granulation plants may form an integral part of such a plan

SUMMING UP

The extra cost incurred in making granular NPK fertilisers in small capacity plant should be viewed in the context of the following benefits : fair return on investment by the granulation plant, availability of balanced grades of fertilizers of assured quality and composition close to the consuming areas, consistency with the future trend of making formulations to suit local requirements, rendering a package of services to the farmers, increase in agricultural productivity and consequential improvement in the living standard of farmers, increased employment vis-a-vis the investment involved as compared to large capacity complex/compound fertilisers plants and contribution towards the development of the region.

This is a typical example where the economy of scale may be sacrified with advantage in favour of an appropriate technology to suit local requirements.

TABLE II : **Indian Production and Imports of Fertilisers** *1975-76*

('000 *Tonnes*)

Material	Nutrient Per cent	Production	Imports
Ammonium Sulphate	20.6	611.1	102.8
Ammonium Sulphate Nitrate	26.0	21.3	10.3
Urea	46.0	2196.7	1469.1

Incentives for Self-Employment

VIRENDRA AGARWALA

IF COMMUNISM has been accepted as the national creed by a substantial percentage of world's population, it is largely due to the fact that democratic countries have failed to create employment potential for absorbing the growing number of unemployeds. In India, poverty has been growing at an enormous pace because the economy has remained so stagnant. The labour market has been overflowing with job-seekers. Poverty and joblessness are almost synonymous terms. If poverty is to be eradicated then the Janata Government must evolve a definite employment strategy and rearrange its plan priorities so that employment opportunities are made available to all those who are now seeking jobs.

The Congress laid greater emphasis on accelerating the pace of growth but ignored the essential aspect of ensuring job opportunity to the growing population of job-seekers. Democracy guarantees fuller opportunities to all but such freedom has little meaning so long as the state fails to provide opportunities for fuller employment to all people in the country. Mere achievement of an increased average per capita income cannot by itself help in the achievement of the objectives unless there is a reasonable assurance of suitable employment to every citizen who has the capacity of being gainfully employed in a manner which will not only give remuneration but also social satisfaction in the use of his talents and capacities. To the extent a plan falls short of generating adequate employment opportunities, it will necessarily give rise to social unrest which, if allowed to grow, can wreck the other benefits that the plan may seek to provide.

It is widely recognised that the weakest part in Government's planning in India has been employment planning. Our earlier plans did not consider maximisation of employment opportunities as an important objective at all. It was only in the fourth plan that emphasis came to be laid on increasing employment opportunities and on the adoption of labour intensive tehniques to the extent possible. However, the employment generation has not kept pace with the growth of labour force. The unemployment among educated and technically qualified persons also continues to cause concern.

GROWING NUMBER OF UNEMPLOYEDS

The Fourth Plan started with a backlog of 16 million unemployeds. New entrants to the labour force during 1969-74 were estimated to be another 23 million. This means that a total of 39 million jobseekers were in the employment market during that period. The situation is still worse. We have already an estimated backlog of 21-22 million unemployeds to which nearly 6 million additional job-seekers are added every year. This means that the country will have 64 million unemployeds by the end of the sixth plan. Though public sector units did increase the employment potential from 104 lakh in 1970 to 128 lakh in 1975, there was complete stagnation in the corporate sector during the last 7 years. As against 3 lakh jobs in sixties it was unable to create more than 50,000 jobs in a year. No reliable data is available in respect of actual absorption either in agriculture or small industries. The organised sector either public or private could not create more than half a million jobs in a year. This indicates that the economy is required to create 50 million jobs by the end of the sixth plan.

The newly constituted Planning Commission has already begun to prepare the base for the sixth plan with greater emphasis on rural development and increased employment. Four major areas of activity have been indentified for realising this main objective. They are: massive irrigation programme, block area planning for employment, programme of minimum needs and public distribution system and evolving such labour intensive techniques in production of mass consumption goods which will create large employment potential. It is true that irrigated area has increased considerably in the last two decades but we have still to go a long way to cover the entire cropped area in the country. At present only 2 million hectares of land are added to irrigated area every year. This needs to be doubled during the sixth plan period. Rural works programme if undertaken on a methodical line can certainly absorb 15 to 20 million unemployed on a regular basis. If industrial growth is accelerated at a rate of 15 per cent a year, it can go a long way towards creating large number of jobs in the organised sector. Cottage and small scale industries, can also provide self-employment to large number of unemployeds and underemployeds in the rural areas. Establishment of schools, hospitals, house sites and rural electrification can also promote new economic activity. The sixth plan is likely to spell out this strategy both in quantitative and qualitative terms.

It is true that no government can ever provide jobs to such a large population of unemployeds. Adequate incentives need to be given to job-seekers to create employment for themselves. As the Janata Government is committed to provide full employment within ten years it should immediately evolve a package programme of incentives which should be made available to such unemployeds who are prepared to create work for themselves. Public sector banks have been extending credit assistance in the implementation of various employment promotion programmes and schemes evolved by the Central and State Governments. They have already sanctioned Rs. 80.5 crore as credit assistance on 68,989 applications under the half-a-million jobs employment promotion programmes. This is just a drop in the ocean. A comprehensive plan of bank credit, technical know-how and raw material on district level need to be so worked out that those living below the poverty line in rural areas are immediately attracted to engage themselves in gainful employment. A well-knit marketing system for indigenously produced goods is an essential requirement for the success of these self-help schemes. □

Steel spells progress; and steel plants are changing the face of India.

Dasturs design the plants that make and shape steel. Plants large and small, to produce steel of diverse types—using Indian raw materials, with Indian know-how—tailored to suit individual requirements. Also, plants for alloy and special steels and ferro-alloys, foundries/forges; rolling mills; metalworking plants etc.

Pioneers of self-reliance in steel plant engineering in India, Dasturs are in the forefront of steel plant design and technology : □ Pelletization □ Sponge ironmaking □ Electric arc furnace steelmaking □ OBM steelmaking □ Continuous casting □ Electro-slag remelting □ Vacuum degassing etc.

They are retainer consultants to the Government of India; also consultants for the new steel plants at Visakhapatnam and Salem; Alloy Steels Plant, Durgapur; IISCO and Rourkela; the Super Alloys Project, Hyderabad etc.

As in India, Dasturs are actively planning steel development in the Arab countries, South-east Asia, Africa and Latin America. They are the principal consultants to the Government of Libya for the Misurata Iron and Steel Complex.

Burden of Centre's Loans on States

L. G. Bapat

DURING THE Chief Ministers' conference held in New)elhi in August 1977, the states 'omplained of the growing burden of central loans on their finances.

A break-up of states' public debt hows that their loans from the 'entre are increasing very fast. These loans were just Rs. 155 crore n 1951. They had gone up to ts. 9,149 crore by 1975, the latest ear for which final figures are available at present. This gives an nnual average rate of growth of 98 per cent. In absolute terms, hese loans have increased by ts. 788 crore during the first plan, ts. 1,071 crore during the second lan, Rs. 2,096 crore during the hird plan and by Rs. 2,995 crore uring the fourth plan. Thus, tates' dependence on centre's loans eems to have grown at a fast rate vith the completion of each plan.

Further, the absolute size of entre's loans was quite large at ts. 9,149 crore in 1975. Since hen, if anything, it has grown still urther. Its proportion to the total ublic debt of the states was also uite high at 75 per cent in 1974-'5. It was, therefore, to be xpected that at some time or the ther, the repayment and servicing f these loans would pose problems o the states.

Out of their total revenue (or expenditure on revenue account), the tates utilised just 1.9 per cent in 950-51 for payment of interest on heir total public debt. Slowly, this roportion began to rise and reahed an all-time high at over 14 er cent by the end of the third lan. Though it has tended to deline thereafter, the proportion in 974-75 was around 5.4 per cent.

Repayment Problems

In addition to the interest burden, he states have to provide for repayment of loans themselves and incur urther expenses towards debt servicing. The total burden on account f these three items reveals a grim icture. In 1974-75, the centre anctioned loans of Rs. 1,075.2 rore to the states. Out of that mount, the states used Rs. 942.9 rore for payment of interest, repayment of old matured loans, and or debt servicing. They were then left with only Rs. 132.3 crore or just about 12.4 per cent of gross loans sanctioned. When the budget estimates for 1975-76 were prepared, the states found that the gross loans expected to be sanctioned by the centre (Rs. 1,143 crore) were likely to fall short by Rs. 31.5 crore in view of the expected burden of centre's loans on their finances during that year (Rs. 1,174.5 crore).

The states were dragged out of their precarious position by the centre by granting about Rs. 180 crore more loans. Hence, though the states had to use about Rs. 120 crore more towards the above three items of debt burden, they could convert the deficit of Rs. 31.5 crore into a surplus of Rs. 32.1 crore by a small economy of Rs. 13 crore in their expenses on the administration of those debts. Though, according to the budget estimates for 1976-77, the states were expected to retain a small amount of Rs. 143.6 crore out of the expected new loans of Rs. 1,282 crore to be sanctioned by the centre, it is difficult to say what the final picture would be. Generally, at least in respect of their debt burden, it is found that the picture presented at the time of submitting budget proposals is wide of the mark. The final picture that is obtained after two years is found to be quite different. Looked at from any angle, the conclusion is clear: the burden of centre's loans on the states' finances is quite heavy and is growing from year to year. What is the remedy?

Solution That May Not Work

A number of suggestions may be offered. The states may be allowed a postponement of loan repayment. But this would only delay the day of reckoning, when the problem would become worse. The states would have to find out funds for repayment of loans maturing in that particular year along with postponed loans. Moreover, the finances of the centre are also tight. If repayment of loans is delayed by the states, the central deficit would be large. In that case, the states would simply be transferring their problem to the centre.

Should the old loans be written off? This also does not appear to be a satisfactory solution. As long as the tendency of the states to rely heavily on the centre continues, the difficulties will raise their head at some future date. Worse still, the knowledge that the centre can be depended upon to cancel old loans would destroy discipline in states' finances.

Is it possible to convert those loans into soft loans? It would certainly reduce the burden of interest payment. All the same, the problem of repayment of loans would remain. Further the centre obtains loans at a high rate of interest from the market. How can then the centre pass on those loans to the states at a lower rate of interest? The difference between these two rates of interest would have to be made good by the centre. It would widen the deficit in the centre's budgets. Further, higher rate of interest indicates the need to economise the use of capital. If the states find that they can get funds at a lower rate of interest, they would not feel the necessity of economising funds with sufficient intensity.

Should we amend our constitution and ask the states to obtain loans directly from the market and stop the present system of centre giving loans to them? Something can be said in favour of this suggestion. Then the States would be required to provide for the repayment of debt and payment of interest on due dates. It would bring more discipline in their fiscal matters. Further, they would be more watchful about the productive use of those loans. If this happens, they would have sufficient funds for arranging the repayment of loans. But this may create problems in other directions.

Under Article 293 of the constitution, the states are required to obtain the approval of the centre before raising loans from the market. In reality, the Reserve Bank exercises this power. It consults each state and finds out the total amount of loans to be raised. Then it finds out the availability of funds with financial institutions like the commercial banks, insurance companies, Unit Trust. If the availability of funds is equal to or more than the requirements of the states, well and good. But generally this does not happen. The available funds are normally less than the requirements. Hence, the share of each state is reduced. Many times, each state gets much less than its demand for loans.

Tapping the Farm Sector

In these circumstances, if the states are free to obtain loans from the money market directly, they would attempt to raise substantially larger

amounts than what they do at present. It would then be difficult to make the issue of loans a success. The states would then be tempted to offer higher and higher rates of interest. This may not be to the liking of the centre and the Reserve Bank. It would raise a much wider issue of the proper interest rate policy to our economy. It would be impossible to frame a uniform interest rate policy for the whole economy and implement it if the states bagan to compete among themselves in offering higher and higher rates of interest.

The proper solution is for the states to reduce their dependence on the centre. They would do well to raise more revenue from the sources left at their disposal by the special provisions in the constitution. Specifically speaking, the states could raise more revenue from the agricultural sector. In India, agricultural and non-agricultural incomes are almost equal at present. But income-tax collected by the centre from the non-agricultural income (Rs. 874 crore in 1974-75) was five times larger than the direct taxes (land revenue and agricultural income-tax collected from agricultural income by the states (Rs. 174.4 crore).

Rural House for Rs. 3450

A reasonably good house at a cost of Rs. 3,450 in a rural area—this is what the National Buildings Organisation has built—18 of them in Jagana village in the Banaskantha district of Gujarat.

Each house which is semi-detached has a plotted area of 84.5 sq. mtrs. The plinth area per unit is about 28.5 sq. mtrs. The house has a multi-purpose room of 3.52 mtrs. x 3 mtrs., kitchen, verandah, chokadi and a latrine. It has also been provided with one smokeless chulha. The total cost of the house excluding latrine comes to Rs. 3,200.

Another important feature of this project is that locally available materials have been used like burnt bricks for walls, AC sheets over local wood purlins for roofing, cowdung leaping for flooring, local wood for doors and windows and cement for finishing.

Similar projects are being undertaken by the rural wings of the NBO located in Srinagar, Jodhpur, Bangalore, Calcutta and Delhi. The idea is to make people aware that a reasonably good house can be had for Rs. 3,500.

WINDOWS ON FARM DEVELOPMENT

Shows and Competitions

CROP COMPETITIONS for giving awards to the country's top farmers are being held a regular feature since 1959-60. So far crop competitions have been held only for wheat and rice. Plans are afoot to organise similar competitions for selecting Krishi Pandits in oilseeds, pulses and cotton and some other important crops.

The competitions are first held at state, district and block levels by the state Governments and at the All India Level by the Ministry of Agriculture. The chief reason for holding these competitions is to encourage the farmers to adopt the recommended practices, and to promote a spirit of healthy competition amongst farmers. Another reason for holding these contests is to focus people's attention on how the new technology can be geared to meet the challenge of higher foodgrain production. The winners at the lower levels are eligible to compete at the next higher level during the following year.

The first six winners in a particular year at the state level competitions are eligible to enter the All India Crop Competition. Three cash prizes of the value of Rs. 3,000, Rs. 1,200 and Rs. 800 are given for each crop to the winners obtaining first, second and third positions respectively. The first prize winner in each crop is also awarded a certificate of Krishi Pandit.

Other Awards

Awards are also given for the best orchards of mango, sweet oranges, grapes, apple, pineapple and guava and also for banana plantations on the basis of All India Competitions. The orchards for competitions should have a minimum area of 0.2 hectare.

The first prize winner is awarded a certificate of Udyan Pandit, a bronze medal and Rs. 5,000. The second prize winner gets a certificate of merit and Rs. 2,000. The orchards are judged on the basis of score cards taking into consideration the various points that contribute to total production, quality of the produce and management. And not just the yield alone.

As milk and milk products play an important part in the country's dietary standard All India Milk Yield Competitions are also organised. The animals are judged according to milk yield obtained in 24 hours. Naturally, different categories of cattle are judged separately.

The most coveted award 'Gopal Ratna' is given to an individual or institution making special contribution towards development of highly productive breeds.

The competition encourages the farmers to keep systematic records of milk yield from lactation to lactation and generation to generation. This in turn helps them to evaluate the response to improvement through better husbandry practices. It also helps the scientists locate the best animals for taking up further development programmes in the country.

If the competitions enthuse farmers to take to scientific lines of production, the shows, go a step further.

'Shows' Show

Shows open up both the agricultural and non-agricultural comunities to the new world of achievements in agriculture and allied areas The Livesotck and Poultry Shows; Fruit and Vegetable Shows serve as a window on the latest development in the respective fields. Farm Information Unit organises these shows, both at regional and all India levels with a clear-cut goal of educating one and all. The visitors watch with pride and hope the fine specimen of livestock and poultry When they witness the best fruits and vegetables, they know what to expect from the farm produce they raise or buy. They also learn about the origin of the different fruits and vegetables

Previously such shows were confined to the countryside only. Now they are organised at important consumer centres as well. The shows also provide opportunities to different people to come together and compare notes on various aspects of research developments. □

Rural Industrialisation for Economic Progress

S. Subramaniam

INSPITE of Mahatma Gandhi and the Khadi and llage Industries Commission, rural lustrialisation has not yet taken the ground. Broad-based ecomic progress in the country is ssible only through an early in-gration of industry with the rural onomy. Decentralisation of instry is necessary for bringing derdeveloped regions and agriculre into the mainstream of develop-ent and for providing the large ral population job opportunities.

The controversy in the past about hether industry should have prioy or whether both industry and riculture should be developed multaneously and in a balanced anner, resulted in considering dustry and agriculture as separate d isolated economic sectors. For lid economic foundations each ctor should reinforce and strengen the other. Multiple economic oss-linkage is very necesry. The only way to transform substence agriculture is to integrate it ith the rest of the economy, rough the provision of tools for odernisation which would give a rward linkage. A growing market r the products of agriculture ould be stimulated to give a backard linkage to industry through the tting up of processing projects d marketing facilities. This, in rn, would stimulate new and growg demand for agricultural products. The demand for processed ods can be expanded, agricultural astes and by-products can be rocessed to augment the feed pply for livestock and the demand r industrial crops, including oil nd fibre crops can be stepped up his will enable the farmers to reak away from subsistence farmg where each family literally prouces only its own food needs, and oves towards diversification of prouction of crops and livestock products. The introduction of canning lants to process fruits that would e otherwise wasted provides a maret for these products in the offeason, raises the price to the farmer uring the harvesting season and nables him to sell to a much larger arket. This also leads to the evelopment of packaging and conainer industries.

Another point of contact and inegration of agriculture with industry in the provision of rural industrial employment and a source of additional income to the surplus rural population. To achieve this objective, we must first use labour more effectively in agriculture, both intensively and extensively; next we must draw off labour to industry and other non-agricultural sectors. The extent to which labour can be absorbed from agriculture into industry will determine the extent to which productivity can be raised in the economy as a whole. There is also considerable scope for providing seasonal industrial employment between peak farm seasons.

Labour intensification in agriculture can be obtained by extending irrigation, by crop and livestock diversification and by the use of improved equipment, breeding stock and production materials, so as to reduce the pressure for additional industrial jobs in the early stages of development.

Urban Concentration

Historically, people drawn off from agriculture and rural areas have been attracted to the large cities This has resulted in general urban congestion, the growth of slum conditions, and a strain on public utilities Gunnar Mydral has pointed out that the growth of industrial centres feeds on itself. a phenomenon which has been observed throughout industrial history. It may be anticipated that increasing urban concentration will cause additional social. political and economic strains by the end of the century unless some positive policies are initiated to improve conditions or to slow down and reverse the process Small town industrialisation policies must replace urban industrialisation

Substantial social overhead costs are attributable to urban industrialisation and concentration. These costs are of special importance for us and comprise social costs associated with the dislocation of people from rural employment and their absorption in new employment, with provision of living amenities. pollution and provision of transportation, power, water and other services.

Among the economic overhead costs are the provision, much below the economic cost of housing, water and sanitation. hospitals, schools, streets and lighting, policing and fire protection, marketing facilities and other amenities usually associated with urban life.

Decentralisation of industry may also imply certain costs which may be borne by government. These, however, must be viewed as external economies to industry. Of special importance amongst these are industrial research, extension, credit services, industrial estates and common industrial facilities.

Industrial Decentralisation

The Karve committee on rural industrialisation, said "The pattern of industrial activity that should gradually emerge is that of a group of villages having its natural industrial and urban centre. These small urban centres will be similarly related to bigger ones. Thus a pyramid of industry broad-based on a progressive rural economy will be built up. In such an organisation small centres can experience a cooperative interest in the bigger ones, and these latter would develop a genuinely supporting instead of exploitational relationship towards the smaller towns and the country side".

As a contrast, the United Kingdom has shown the feasibility of a positive industrial location policy as a most effective method of controlling the distribution of the population This has been a core principle in the regional planning of the United Kingdom, that is encouraging industry to move to the depressed development areas afflicted by chronic unemployment. The Puerto Rico economic development administration is pursuing a decentralisation pattern along very specific lines. with differential factory rentals to attract industry to the more distant and less favourable locations.

We too can follow a step-wise penetration of interior regions by establishing flourishing industrial nuclei away from the large urban centres. Eventually it may be feasible to extend industry down to the small towns and large villages. If properly utilised, industrial estates are an efficient device because consultancy services. supervised credit and common facility services can be built into them to provide some of the economies of scale to small industry.

The industries to be chosen for rural development can include agricultural implements, including processing equipment, industries to pro-

cess foods, feeds, and agricultural raw materials used in industry, mechanical repair facilities, capital goods for manufacturing implements and processing machinery and essential consumer goods industries.

The major problem in decentralising industry may be to find the entrepreneurship required to develop the industrial nuclei. The urban cultural milieu in general and industry in particular produces technical people and individuals controlling blocks of capital which are spawned by the existing industry. Moreover, many of the industrial opportunities are based on serving the existing enterprises. The real problem thus is how entrepreneurship can be attracted to the new industrial centres.

As there are certain economic limits to which decentralisation can be carried out in practice, it may not be wise to set up industries in the villages unless suitable entrepreneurial talent is available and the enterprises can be made viable. It may be feasible to stimulate industry in small cities and towns without incurring excessive expenditure. Since investment and working capital are major bottlenecks in such ventures the development banks and nationalised banking system will have to operate in the interior regions.

Finally, there might be another approach to the problem of rural industrialisation, namely, by making the village as the nucleus for providing entrepreneurship, supervisory personnel and investment capital. The Israeli kibbutz farm—which works as an economic unit on a collective cooperative basis in the village—has provided managerial and supervisory personnel from its membership. In the course of time, manufacturing activities have grown up in many of these economic units, due to previous industrial training or interest of some members to perform essential repairing or manufacturing services. In other cases, the kibbutz saw opportunities in agricultural processing for more effectively disposing of farm products. A collective farm of this type is an effective device for accumulating capital, and in the course of time it must necessarily expand to provide for the growth of the community by setting up new farm colonies or by investing in industrial enterprises. As the members are not paid wages and all their meagre needs are supplied by the community wealth must necessarily accumulate. The organisation of the Chinese villages into communes is also along these lines. □

Solar Energy for Central Water Heating Systems

ISRAEL IS a world leader in the utilisation of solar energy. Some 250,000 families heat their water supply, either partially or fully, by means of solar energy collectors.

Still over 12 per cent of the nation's energy supply is used to heat water for domestic purposes at an annual cost of about ILI b. .

The national as well as household energy bills can be greatly reduced by utilising, on a mass scale, central solar water heating systems in apartment buildings. This was the finding of a team of scientists at Ben Gurion University of the Negat, following a two-year research and development project using such systems.

Working with a prototype servicing at university dormitory, professors David Wolf and Avraham Tamir, and Dr. Avraham Kudish found that a central apparatus is both technically and economically more desirable than individual solar units now in the market.

Thirty such systems are now in operation in Israel, including one in Eilat at the 100-room Neptune Hotel. About one-half of these units are produced by the Miromit Company. A spokesman for Miromit recently appealed to the Government to encourage the installation of the central solar units by eliminating the purchase tax on such systems.

Less Costly

Now commercially available, the central system can save consumers 40 per cent of the purchase cost of a comparable number of individual units. In addition to increased efficiency of heat transfer and the lower price tag, the central system offers an aesthetic advantage over individual units, which clutter rooftops with unsightly storage tanks and irregularly placed plate collectors. No storage tanks protrude from the rooftop in the pump-activated central system. Instead, one large tank is placed unobtrusively alongside the building in a wind-protected area to reduce heat loss.

The prototype installed at the student dormitory in Beersheba uses 20 standard collectors, integrated into one system, to supply hot water to 24 apartments. The system is operated by two small pumps, located next to the water tank. One pump circulates water between the tank and the collector, and the other between the tank and the housing units. The system is activated by differential thermostats between the collector and the storage tank.

The solar unit still requires an electric or fuel-fired back-up system for the few winter months when only 20 to 30 per cent of the energy needed for heating can be supplied by the sun. But for the rest of the year, solar energy can provide 80 to 100 per cent of the hot water needed.

One reason for the comparatively low cost of the central system is that it works on the 'banking" principle, that is, all the tenants will not want to draw hot water at the same time. Thus, 38 square metres of collector surface are sufficient for 24 apartments instead of the 72 square metres.

"Although collector space is reduced by 40 per cent, heat efficiency is improved", claims Prof. Wolf, director of the research project. Using the central apparatus, we have been able to lower thermostats on the back-up heaters from 70C to 40C.

If applied on a large scale, the central system will considerably reduce the energy used by the 800,000 electric hot water tanks in use now

According to Prof. Wolf, the system is applicable to most multistorey buildings and is relatively inexpensive to adapt to buildings using conventional central water-heating systems. In the latter instance, solar collectors need only be added to the already existing central storage tank and circulation system

The team of researchers is also working on the development of low-cost collectors to replace conventional ones made of galvanized metal, which cost from IL 3,000 to IL 4,500 per unit. They are currently testing prototype collectors made more cheaply from plastic materials. □

The Sun consists of 2-2 octillion *tons of gaseous matter, mostly hydrogen and helium, with a surface temperature of* ***10,000 F.***

Yojana Quiz

1. Where one can see the Shahyad Monument ?

2. What is Gouffre Berger ?

3. Earth revolves round the axis once in 24 hours. How much time the Sun takes to revolve once round its axis ?

4. What is Aurora Australis ?

5. The Atomic Age is said to have started with the explosion of a test bomb. When and where the explosion took place ?

6. Which are the places connected by National Highway No. 1 ?

Answers

1. The Shahyad Monument is in Tehran, built to commemorate the 2500th anniversary of the Iranian Empire. It is 45 m high, the height of the large arch is 21 m, the base is 63 m wide. It was designed by Hossein Amanat, a talented young Iranian architect.

2. Gouffre Berger (France) is the deepest cave in the world. It is 3,723 ft deep.

3. 25 days 9 hours.

4. Aurora Australis is a broad display of rather faint light in the southern skies. The light which appears on the northern skies near north pole region is called Aurora Borealis.

5. The explosion of the test bomb was on July 16, 1945, near Alamogordo, N M USA at 5 30 a m local time.

6. National Highway No 1 has connected Delhi, Ambala, Jullundur and Amritsar and then has proceeded to the border between India and Pakistan

Quotation Box

A century ago Britain's system of government was the envy of two thirds of the world, and the overload of much of the other one third. Today the mother of parliaments is kitchen maid to two alternating party political tyrannies, neither of which is ever elected by, or represents, majority of the British people

BOOKS

Understanding Labour Economics

Readings in Indian Labour and Social Welfare *by Dr. J. N. Mongia; M/s. Atma Ram & Sons, Delhi,* 1976 ; *Pages* XIX + 804 ; *Price Rs.* 100.

THIS veritable compendium produced by an enterprising official economist specialised in the field serves the timely purpose of focussing the various aspects of the subject with 24 well-chosen papers and five appendices. The profile of Indian labour written by the author himself serves as a useful introduction to what follows on industrial labour, recruitment, workers' education and training, working conditions, wages and earnings, machinery for wage fixation, wage policy, trade unionism, industrial relations and workers' participation in management, all burning issues that retain public attention today.

The somewhat detached viewpoints based on the specialised approaches emanating as offshoots of planning in India are dealt with in the chapters on labour in public sector undertaking, labour welfare and social security measures, definitional and measurement criteria of unemployment and manpower planning Omnibus treatment of labour legislation and administration and productivity, two papers on labour productivity and statistics followed by one on labour research lead us on to the role of the ILO in India Two studies on agricultural labour and women workers in India have been given towards the end. Together with five appendices on technical aspects of labour economics this publication is rendered rather comprehensive in its coverage and lucid in the presentation of facts relating to policies and programmes

The substantial papers included in these readings have been carefully chosen both from experienced official and academic researchers. The temptation of the more specialist writers involved in studies on isolated problems has been too often to skip over the basic issues and swing on to different schools of thought that are not infrequently tinged with ideological coatings However, in regard to this book the papers chosen are singularly free from this tendency All the same these readings might call for some updating of facts and figures in its second edition. The book carries a detailed subject index and useful bibliography towards the end of some papers

Overall, this book should be very handy for the use of labour administrators, college students and the general public with each one inexorably left to feel the pinch of the heavy price which might well have been subsidised to suit the pocket of a larger lay readership.

—**B. N. Nair**

A Comparative Study

Modernising Indian Peasants *by Surinder Jetley, published by Asian Educational Services, New Delhi-110016; Pages* 182; *Price Rs.* 48.

SURINDER Jetley draws a vivid picture of life in two Indian villages in this book. From the research made on this life, she gives a resume of the modernisation and ignorance of the peasants Both her case studies are very enlightening.

When she talks of Tiari and Dehia in her book, one is simply carried away with the lucid description of the people she meets. In fact the greatest contribution of this book is the description of two opposite villages and the characterisation of the castes involved. The examples set by the Kurmis of Tiari and the Brahmins of Mirdadpur are two geometrically opposite propositions. How much one community can achieve with cooperation and dignity of labour is well depicted in the case of village Tiari and how badly can one community come out with all the resources in hand but having no respect for dignity of labour is equally well described in the case of village Mirdadpur. Surinder jetley, however, does not finish her description here She goes a step further to say that our village communities suffer from a sense of hopelessness in the face of ignorance Truly, the best of facilities given by the community development departments have not yielded the desired fruit due to the village community's state of utter hopelessness coupled with ignorance and jealousy. Those who shed the traditions and worked in cooperation have prospered (Thakurs of Chak and Kurmis of Tiari, pages 52 and 62 respectively are examples). And worse off are those who having every available resource at their command, have yet met the same fate as the Brahmins of Mirdadpur. (page 70 in the book)

Through a painstaking research study of the life in villages, the author has brought out in her thesis cretain revealing facts quite unknown to many scholars. For instance she has highlighted the strong incentives provided to the Japanese peasants to improve their skill and technology for producing more, from the detailed comparisons of the characteristics of peasants made in the books of Kusum Nair. According to her the British system of collecting land revenues with the help of intermediaries was chiefly responsible for creating neo-landlordism in India.

The book is a great research piece on a comparatively dull subject but the author deserves kudos for the smooth and easy approach to the subject. There are a few factual errors, perhaps misprints, like the 200 years of British rule in India The years of British rule are far less than that

-**Kumar**

Labour Laws

Workers' Welfare and Law *by Pawan Choudhary Metropolitan Book Co. Pvt. Ltd., New Delhi; Pages* 144 ; *Price Rs.* 40.

SINCE long, both for the general reader as wel[l] as for the student of labour laws, there has bee[n] a genuine need for a study at one place all the law[s] concerning labour and labour welfare. This is a modes[t] compilation of the author's few selected articles o[n] different aspects of labour laws, already published i[n] different papers and periodicals during the last seve[n] years. The author has done a competent piece [of] work.

The book has been divided into three part[s] Part one contains a number of articles on th[e] aspects of industrial disputes covered under the Indu[s]trial Disputes Act. Part two contains a mode

attempt to highlight some of the legislative pieces tailored by the government in recent times and the problems which have been either anticipated or actually experienced during the working of the workers' welfare legislations. Part three brings out the complementary role of labour and production The publication will serve as a compact and handy companion for those connected with workers' and their welfare.

—N. C.

Applied Economics

Readings in Applied Economics *by Navin Chandra Joshi, Vivek Publishing Company, Delhi,* 1977; *Pages* 272; *Price Rs.* 48

THIS book, written just before the recent Lok Sabha elections, attempts to discuss economic development in general and the developments in our country in some fields as agriculture, industry, infrastructure and trade. The general aspects of development cover though briefly, regional planning, manpower planning and project evaluation. There is emphasis on non-GNP approach to development and also on steady, even if, lower rate of growth rather than on high but fluctuating rates of growth.

Agricultural, industrial, monetary and trade policies have been dealt with in the relevant chapters and India's progress in these fields has been highlighted. The treatment of performance of public sector covers the relative performance of public/private sectors, the basic causes and constraints for the apparent la[g] the performance of the former. Stress has rig[htly] been laid on the need for improvement in the man[age]ment efficiency, higher utilisation of capacities in public sector units, improvement of efficiency reduction in costs of operation and the need realistic pricing policies for them.

The book has a useful bibliography at the [end]. It also contains appendices which cover ne[arly a] quarter of the book and treat matters such as and pattern of growth, financial resources and out[lay] in the fifth plan and the 20-point new economic [pro]gramme of emergency vintage which appear to [have] been reproduced from other publications. Tho[ugh] informative, the book is, somewhat highly priced is extensively repetitive at certain places.

—G

CIVIL SERVANTS VERSUS POLITICIAN[S]

(*Contd. from page* 9)

the government. Such an understanding is essential smooth relations and swift transaction of public b[usi]ness

Ultimately, it is to public service, honesty and et[hics] that every public servant—politician or bureaucra[t] should be committed It is, as I said, a question bonafides. If the politician and the bureaucrat un[der]stand their roles and perform them honestly fearlessly—neither of them wanting to stick to o[ffice] at any price—there can be no scope for any con[flict] of jurisdiction

Many Use of Neem

THE NEEM tree, a native of India and ever-green, is known for its varied scientific properties. Besides the use made of neem sticks as tooth brush nd of neem leaves in the foodgrain containers to save stored grain from pests, the use of neem oil in oap-making and of neem cake is extensive.

It is estimated that in India there are 1.38 crore neem trees. These produce about 4.18 lakh tonnes of neem seed every year and it can yield 83 lakh onnes of oil worth Rs. 33 crore to Rs. 50 crore and 3.30 lakh tonnes of neem cake worth Rs. 14 crore, to Rs. 20 crore, provided the entire seed crop is collected. However, the present seed collection is very different. It is no more than a meagre one lakh onnes

The Directorate of Non-edible Oils and Soap Industry of the Khadi and Village Industries Commission had been carrying out research in Pune on neem cake and neem oil since 1969.

Application of neem cake-blended urea in paddy crop not only increases the yield of paddy but also adds to the protein content of rice The findings at Padegaon sugarcane research station in Maharashtra have given promising results. The station has said that if neem cake is used, the nitrogen need per hectare for *adsali* cane (of 18 month duration) can be brought down from 400 to 300 kg., making a saving of Rs 338 Apart from saving on fertiliser, there will be increase in the yield of sugarcane by 2.2 tonnes er hectage, further addition to the sugar content and rise in profit by Rs 330 per hectare Use of 22 kg of neem cake for paddy crop and 140 kg. of neem cake for sugarcane crop per hectare is recommended Neem cake blending prevents nitrogen losses om urea The slow release of nitrogen results from certain property which exists in the bitter part of em cake Similarly, the activity of certain types of cteria in soil is also controlled by the neem cake and e slow release of nitrogen helps the growing crop ie reseach findings on crops like paddy and sugarcane ave shown that urea nitrogen could be saved to the tent of 25 to 50 per cent with the application of em cake-blended urea

If the potential neem cake of 3.30 lakh tonnes is ed, 1.48 crore hectares of paddy or 23 lakh hectares of sugarcane will benefit. In India, urea worth . 1,777 crore is used for paddy crop and Rs. 108 ore for sugarcane. Urea worth Rs. 110 crore and . 54 crore respectively is lost due to leaching or nitrification The nitrification inhibition property of ligenous source like neem cake can prevent this avy loss

The employment potential of the neem seed collection is to the extent of four lakh persons for 60 n days with wages going up to Rs. eight crore. The em seed collection work is a productive job which n provide large scale employment to the landless bourers at least for 2 to 3 months in a year. School ildren during their free time or vacation can collect em seeds that drop from trees The seed after shing the outer pulp would fetch them pocket ney or enable them to earn enough to meet their hool expenses.

The neem can be planted in waste lands. One hectare of land with a hundred neem trees can yield after years of plantation about 5 tonnes of seeds every ar.

About 18,000 tonnes of neem oil are said to have been used in soap making in 1975. Neem oil is used in some medicinal preparations and also, effectively as pesticide. Neem oil if applied to seeds or grains can protect them from stored grain pests, 800 grams of neem oil being applied to 100 kgs. of seed or grain.

Neem kernel meal, after some processing, yields high grade protein suitable for use as a constituent in poultry feed as a substitute for groundnut meal.

On Canine Lovers

MRS. S. B. SARIN

I HAVE read innumerable articles and stories describing the cruelty of cold humans towards the wonderful species of DOGS. I suppose no harm will be done if something is said and written about the other side of these mute darlings.

The other day my husband and I went to visit some friends. When we reached the door to their drawing room we rang the door bell. When the lady of the house came out she looked aghast. Both her husband and she could not get over the fact how their darling doggy (I mean bitch) had let us come through the main entrance. "She (the doggy) normally guards the house so well". However the doggy did not spare us when we took our leave She pounced on my ankels. Did I shriek ! "Oh ! Don't worry, this is her usual practice," said the couple most nonchalantly.

Then we have some friends in Maharani Bagh who have an alsatian who has built up quite a record for biting a good number of humans. The gentleman who lives in the upper storey of the same house (a strudy six-footer) is scared of this dog that every time he wants to step out of the house he shouts for his servant to come out with a stick.

Despite repeated complaints by him and other neighbours, the owner refuses to chain the dog. Her standard argument is "How would you like it if suddenly chains were put on you. After reading the hair-raising tales of the experiences of the MISA detenues during the Emergency, do you still want me to chain my dog, and curb his freedom ?"

The crowning glory to the above two cases is the story of my best friend's dog The lady (I mean my friend) is really fond of her husband as also of her three children However, she has a special affection for her dog. The little monster it seems has bitten all her family members at one time or another, excepting her. This fact makes her love him all the more as it is an added proof of the fellow's devotion to her.

However, what really gets my goat is dogs being described as poor mute, tongueless (Bezubaan) animals Whatever is meant by this ? Has no one ever heard the ear-splitting noises that they make, in different tones especially in the quiet of the night. And regarding the extra-intelligence bit I would like to give an example. Once a dog was forced on me by some friends. The brute bit my little son without any provocation. The blame was put on my son by my friends who thought the child must have teased the dog ! The experience was enough for me to return him to his original owners.

Personally I feel sorry for the people who feed these brutes with love and food in the hope that need be they will be protected from theft or burglary And at the time of test, the dog is lured away by piece of flesh, a bitch or any other diversion provided by the enticers.

JANATA GOVERNMENT IN HARYANA

ACHIEVEMENTS

* Civil liberties restored; a new atmosphere of freedom brought about among the masses.

* Unprecedented flood combated; relief work carried out despite the economic constraints.

* More attention on irrigation and power; more than 70 per cent of the plan outlay allotted for augmenting irrigation and power facilities; a scheme underway to instal 400 augmentation tubewells and 200 direct irrigation tubewells.

* Sprinkler irrigation being introduced and a scheme drafted out to brickline 1100 Kms. long water channel.

* Subsidy on fertilizers being given to farmers; distribution of crop loan amounting to Rs. 80 80 crores; extension of intensive cotton cultivation in 350 villages costing Rs. 12 8 crores;

* A double-target scheme to provide employment to the rural youth and create an infrastructure of small scale industries; financial help, technical know-how and marketing facilities being provided in order to flourish cottage industry.

* "Jana Swasthya Rakshak Scheme" formulated covering a total population of about 10 lakhs with a total expenditure of Rs. 5.70 lakhs during the current financial year.

* Ambitious programmes making headway for the welfare of labour classes and weaker sections; schemes being implemented to provide sufficient drinking water to the villages and extend education facilities to women.

* Prohibition introduced on selective basis in a number of villages.

Issued by : Director Public Relations, Haryana.

Electrolytic Manganese Dioxide Plant Goes on Stream

A 1000 tonne per ann-
ı capacity Electrolytic
ınganese Dioxide Plant
sed on technology de-
'oped by the National
etallurgical Laboratory,
mshedpur has gone into
oduction in Trivandrum.

The plant costing Rs.
ı crore uses medium
ıde manganese ore and
ste ferrous sulphate-
ıphuric acid solution. By utilising this waste liquor, the pollution and disposal problems of this waste have been reduced besides reducing the cost of the project.

Manganese Dioxide is used for the manufacture of dry cells as a "Depolariser". The Govt. of Burma has also evinced interest in the NML technology and has asked for its know-how.

Industrial Units in Gujarat

A total of 4,728 small industries were set-up in Gujarat during last year. The four districts of Ahmedabad, Surat, Rajkot
d Baroda accounted for
many as 2885 of them
according to an official
ort. Ahmedabad the
mer state capital was on top with 1228 industries followed by Surat and Rajkot with 662 each and Baroda 333.

The number of small units in Gujarat had increased from 25,562 at the end of 1974 to 30,290 by the end of last year.

Rail Coaches to be Fully Indigenous

roduction of coaches
the Integral Coach
ctory (ICF) in Madras
become cent per cent
genous by next year.
eady 97 per cent of
duction at the ICF
ndigenous. Only the
en steel—a low alloy
tensile and cor-
on resistant steel is
g imported at pre-
The Rourkela
l Plant is now ex-
ed to produce this steel for the ICF. When it is done, the import content of the coaches will be practically eliminated. During the last decade, ICF had exported coaches worth over Rs. 10 crore. This year export orders worth Rs. 9 crore were bagged by the ICF : 32 brake vans for Nigeria and 30 coaches for the Philippines National Railway.

Increase In Power Generation

here has been an
ase of over 6 per
in thermal power
ration, including nu-
in the country during the period from April to September this year compared to the corresponding period last year. The total power generation inclusive of thermal, nuclear and hydro, has gone up by about 2 per cent during this period over that of the corresponding period last year. The total power generation in September this year was 7,550 million units as against 7,066 million units during the same period last year thus showing an increase of over 6.8 per cent.

Two new thermal units of 180 mw were commissioned during September, thus bringing the total thermal installed capacity to 12,190 mw. Of the two units one of 129 mw was commissioned at Amarkantak (Madhya Pradesh) and the other of 60 mw at Harduaganj (Uttar Pradesh).

Another Oil Strike off Bombay

The Oil and Natural Gas Commission has struck another major new offshore oil source located about 70 kilometres to the south west of Bombay and nearly 65 km south of the Bassein gas field near the Bombay High Oilfields. The oil well drilling began in September. Now, 1,475 barrels of crude oil (about 200 tonnes) along with the 250,000 cubic metres of gas are being produced every day.

The ONGC would have to drill two more exploratory wells within next few months to deliberate structure of the oilfield.

Rural Electrification Benefits Economy

Recent studies on the performance of the rural electrification in India indicate that rural electrification programme has been highly beneficial to the economy. The social benefit-cost ratio of the rural electrification programme has been consistently higher than their input.

Rural electrification programme started in 1951 By 1965-66 about 45,000 villages had been electrified and 5 lakh pumpsets energised. The corresponding figures by the end of March 1977 were 2 lakh and 30 lakh, respectively. During the current year about 20,000 villages are targetted to be electrified and 3,00,000 pumpsets energised

Employment-oriented Development

The Tripura government proposes to have an allocation of Rs. 125.70 crore during the next plan period for employment-oriented industrial development. The approach paper of the industries lays stress on the development of rural, agro-based, small and cottage industries, besides the development programmes in sericulture and handloom sectors. The employment generated through all these schemes is expected to touch 15,000. Of the total allocation, Rs. 70 crore has been earmarked for a paper mill, having an employment potential of at least 10,000.

Besides the proposal for setting up a 25,000 spindle spinning mill, the approach paper includes proposals for Rs. 5 crore for sericulture, Rs. 7 crore for weaving, Rs. 10 crore for small-scale industries and Rs. 10 crore for handloom and handicrafts.

(*Contd. from Cover two*)

therefore, increase the allocation of resources for soil conservation, land reclamation, afforestation, flood control and agricultural research and extension work.

There is urgent need to step up research work for the development of new high yielding varieties of seeds for pulses, coarse grains like bajra and jowar, sugar, raw cotton and oil seeds. Consolidation of holdings also greatly enhances the viability of small farms and, therefore, deserves national priority.

Government should take steps to see that all available organic manure is conserved and utilised for increasing agricultural production. Alternative fuel will have to be provided for the rural areas in order to conserve cowdung and prevent destruction of trees. Further, existing *choolhas* should be improved to achieve fuel economy.

Development blocks can perform genuine service to the farmers if they can organise farming families around rural development centres. These centres should provide at one place a market for agricultural produce, warehousing facilities, sale of agricultural inputs and services for repairing pump-sets and agricultural implements, spraying and supply of raw materials for cottage and small industries in the area. These centres should have market outlets in the urban areas. Farmers should be supplied with passbooks with up-to-date entries in respect of credit limits etc.

Power cuts should be equitably borne by all sectors; in the allocation of additional power generated, agriculture should be given priority. The system of levying fixed service charges by the irrigation and electricity authority should be reviewed with a view to ensuring that the burden is not unfair and unjust.

As the prices of agricultural produce will depend to a great extent on prices of agricultural inputs, reduction of the input prices is important. The party, therefore, recommends that the government take steps progressively to reduce excise duty so that the duties on fertilisers, pesticides and weedicides are completely abolished in the next three years.

The price to be paid to the farmers for his produce should be fixed according to the principle of parity, that is, maintenance of balance between prices received and prices paid by the farmers. A support price, which should be lower than the parity price. should be fixed below which it should be government's endeavour, through efficient purchase arrangements, to see that they do not fall.

Independent Peasant Farms

THE JANATA party believes that a system of small independent peasant farms assisted together by service cooperatives, will meet our needs or fulfil the aims of our economic policy best. It will produce more crops, provide employment for more workers, lead to more equitable distribution of wealth or avoidance of undue disparities in income and help strengthen democratic trends more than any other system of farming.

This system demands that every cultivator is given a stake in the land he holds, which means that he will be made its proprietor and no threat of ejectment will keep hanging over his head any longer. Unless those who work the land own it, all the rest is likely to be writ in water.

The Janata party recommends strongly that th[illegible] various items of land reforms legislation are ful[illegible] implemented within three years. A major portion [illegible] the surplus land and uncultivated government lan[illegible] available for distribution will be given to landl[illegible] scheduled castes and scheduled tribes people.

National interest demands that a floor on la[illegible] holdings is also laid and that the law relating [illegible] inheritance, transfer and partition of land is [illegible] amended that the area of land per farmer or agric[illegible] tural worker is not reduced below 2.5 acres. Th[illegible] will be possible, however, only if diversification [illegible] the economy and industrialisation proceeds at a pa[illegible] faster than the pace of population growth.

We recommend that government should consi[illegible] formulation of an agricultural policy statement a[illegible] logous to the statement on industrial policy.

The programme for speedy development of ru[illegible] infrastructure involving provision of pure drinki[illegible] water, adequate number of rural roads, rural elect[illegible] fication, dispensaries and schools assumes great i[illegible] portance. The party calls upon the government [illegible] allocate adequate funds for the development of ru[illegible] infrastructure in the next five years. A success[illegible] programme of this type will make a major contri[illegible] tion to improving the quality of rural life and p[illegible] venting premature excessive migration to the ur[illegible] areas. Each state should, to begin with, select [illegible] least two districts for intensive development. F[illegible] for work programmes and employment guaran[illegible] schemes should first be implemented in these distri[illegible]

The productive activities on which we sho[illegible] concentrate in the rural areas must include constr[illegible] tion of roads, planting of trees, tanks, wells, lift irri[illegible] tion and other water conservation schemes, levell[illegible] of soil, bunding, bringing new land under cultivati[illegible] construction of gobar gas plants and so on. Anim[illegible] husbandary has great possibility and this occupat[illegible] can be fully decentralised

An effective programme of implementation m[illegible] necessarily have the support and assistance of [illegible] state governments. It is also our firm conviction t[illegible] planning and national development must go hand [illegible] hand with a participative style of democracy.

IN ANY long-term strategy of development we [illegible] not overlook the imperative need for industr[illegible] sation. The primacy of agriculture to which the p[illegible] is firmly committed must not be seen as a bias ag[illegible] industry or neglect of the longer term perspectiv[illegible] development It simply reflects an awareness tha[illegible] the present state of India's development, a sust[illegible] increase in agricultural productivity is almost a [illegible] condition for further advance in industry. So lon[illegible] India's rural masses remain poor the market for in[illegible] trial goods must remain severely restricted.

The Janata party believes that, even after me[illegible] the capital requirements of rural areas, it will be p[illegible] ble as well as desirable to provide substantial reso[illegible] for development of vital industries needed for ex[illegible] sion of agriculture like fertilisers, pesticides, ce[illegible] and agricultural implements. It will also be nece[illegible] to devote substantial resources for developme[illegible] transport and, especially, power in the next five y[illegible] With this end in view the national resources of e[illegible] such as water, oil, solar energy and nuclear [illegible] will have to be speedily developed. In additio[illegible] will be desirable to push ahead with the develop[illegible] of such resource-based industries as steel and alumi[illegible]

(*Contd. on Cover* [illegible])

Industry Must Generate Surpluses

(Contd. from Page 34)

In view of the present needs of investible resources for agricultural and rural development, both the public sector and the organised private sector must generate surpluses and use their own internal resources for growth and expansion. This would imply that their productive efficiencies must improve and their pricing and output policies must be so adjusted as to generate surpluses. **These surpluses should not be thrown away by way of indiscriminate distribution of dividends and bonus and increasing the perks and amenities of the top people.** These surpluses must be saved and invested for growth and expansion thus relieving the public exchequer and the banking system of the need for continuously channelising further investible funds, which can then be diverted towards agricultural development and building up cottage and decentralised industries.

In areas reserved for small-scale industry future capacity should not be permitted in the large-scale sector. In order to encourage small entrepreneurs and self-employed people, administrative procedures will have to be simplified.

In deciding on the question of reservation, government will have to keep in mind considerations of employment generation, broad-basing the pattern of entrepreneurship as well as economy in the scale of operations.

We must continue to encourage *khadi* which was associated with the struggle for national independence and which provides employment for a considerable number of people. Credit and technical assistance should be provided to small-scale and cottage industries on a liberal scale so as to enable them to improve both their technique of production and marketing of their products. Modern management techniques and quality control must be introduced. The party would like the government to clearly demarcate the areas of reservation for the small-scale and cottage industries which use power and cottage industries which use no power.

The party's policy will be: what can be produced by cottage industry shall not be produced by the small-scale or large-scale sector, what can be produced by the small-scale sector shall not be open for large-scale industry. The reservation of fields must be clear and, where necessary, statutorily defined. The only exception that may be considered will be for production that is entirely for export.

THE JANATA party, therefore, proposes that till full employment has been achieved, no new capital intensive enterprises shall be allowed to be established for manufacturing any consumer and other goods which will be statutorily reserved for production by cottage or village or small-sector. The government should not permit any expansion in the weaving capacity in the organised mills sector. New weaving capacity should be created only in the decentralised sector consisting of, first, handlooms and, second, powerlooms whose ownership should be widely diffused. Weaving and production of footwear and soaps and, if possible, other articles, in the organised sector should be progressively reduced so that the entire weaving and production of footwear and soap is allocated to decentralised sector within a 10 year phased programme.

It is essential that all metropolitan areas, cities and towns produce a regional plan which will scientifically disperse congestion of industry and people without destroying the natural aesthetic. Provision should be made for slum improvement, housing for the poor and the displaced slum-dwellers and, where possible, allotment of house sites for them. In doing so, care should be taken to ensure that they do not have to travel long distances to their places of employment.

To prevent concentration of industries in a few large urban centres, the government should prohibit the starting of new industries in urban centres with a population of 10 lakhs or more or in the environs of these centres within a radius of 15 to 20 kms.

The government should provide infrastructure facilities including power in selected places so that industries can be diverted to these areas. A system of standardised components, parts and ancillaries should be increasingly adopted so that quite a substantial portion of the production processes can be decentralised.

Constructional activity like laying of new railway lines, irrigation, road building and housing has a very large employment potential. This activity is also important from the point of view of social needs. It will also stimulate demand of steel and other materials for which the demand is at present very slack. All restrictions on house building must, therefore, be removed and individual initiative and cooperative endeavour must be given full play to meet this pressing social need. Encouragement must be given to house building activity *of* the common people and also *for* the common people. However, construction of lavish and luxury flats should not be allowed. At the same time, production of cement and other building materials like bricks and mortar should be rapidly increased so that shortages and black markets do not reappear. Public authorities should give special priority to construction of houses for the economically and socially backward, including harijans and adivasis.

INDIA HAS a huge internal market of over 600 million people. The potentialities of this market are vast. Besides, India is well endowed with basic natural resources. In planning for self-reliance, we should concentrate in those areas where we have comparative advantage and where we can produce goods economically and profitably at low cost both for the domestic and external markets. Without expanding the internal market and increasing the volume of production for domestic consumption, neither can costs be brought down nor can our goods be made competitive in external markets. The question of self-reliance has also to be approached from the point of view of generating employment. Thirdly, considerations of natural strategy would also necessitate self-reliance in certain critical and strategic areas. In other areas, where production in the country would be uneconomical, producer and mass consumption goods which are in short supply may be imported from the cheapest sources as part of the overall strategy of containing inflation and bringing down price levels. But this should be counterbalanced by strong export efforts. The Janata party would like to caution that due care must be taken to ensure that the export drive does not cause scarcities of critical commodities and essential articles of consumption in the domestic market.

Attack on Monopoly

(*Contd. from Cover three*)

The Janata party will not go in for foreign collaboration in areas where adequate Indian skills and capital are available. Wherever the need for foreign collaboration is felt in areas of high priority, emphasis should be on purchasing outright technical know-how, technological skills, and machinery.

[illegible] provisions of FERA must be rigorously en- [illegible] in the sector of consumer goods industries. The [illegible] firms should be asked to carry forward the [illegible] of Indianisation. Their production capacities also should be frozen at the existing levels

The party would commend the example of Japanese industries which brought about astonishing expansion without providing any significant role for foreign equity capital. The Japanese imported the best available technology and then adapted it to their own needs. We call upon our scientists and technologists to evolve a forward-looking, small unit technology suited to our condition and needs.

The entire strategy of development must seek to achieve the widest possible dispersal of ownership of property and the means of production

A PECULIAR feature of the post-independence industrial development has been the dominance of about twenty industrial houses These industrial groups have used their entrepreneurial resources, their connections with the administration and their capacity to manipulate, to frustrate measures designed to curb concentration of wealth The Government may allow these industrial groups to expand only in those areas where such expansion is clearly in the national interest and in accord with national priorities The government should not, however, permit any company or group of companies to have a dominant share of the market in what they produce nor should it allow these companies to be in a position to dictate terms to producers, raw material suppliers and consumers In order to break the monopolist stranglehold of a group of companies or inter-connected companies over the market in the goods they produce, these inter-connections or groups will have to be broken, and the law must unambiguously empower the authorities to do this so that unnecessary litigation on this subject is avoided It should be the policy of the government to encourage new entrepreneurs in new lines of industrial activity and, by systems of progressive taxation on income and wealth as well as direct measures, curb the concentration of economic power

The party commends to government a price policy with the following essential ingredients : a firm control over money supply ; incentive prices designed to secure an adequate increase in the production of basic consumption goods ; timely arrangements for import of commodities in short supply ; a well-functioning public distribution system , and stringent action against unscrupulous traders and hoarders

Remunerative procurement prices must be seen as an essential element of increasing agricultural production and of stabilising prices, particularly of pulses, raw cotton and oilseeds.

THE ESTABLISHMENT of a marketing network will ensure the availability of goods to the common man. The public distribution system would have to be extended to all areas of the country. It must distribute through its network cereals, pulses, cc oils, sugar, textiles and kerosene. The public distr tion system in the rural areas should be based panchayats-*cum*-cooperatives. In towns it sh increasingly use consumer cooperatives. A functio public distribution system presupposes procurem by the state of large supplies of the essential arti

Economy must be the watchward of governme organisations. Drastic cut in non-developmental penditure is necessary to divert resources for deve ment. There should be a clear realisation that cost today are incredibly heavy and a poor country, seel to pull itself up by its shoe-strings can ill-afford th

A literacy army will help in tackling the problen unemployment among the educated youth and a l army in solving the problem of rural unemploym

It should be possible to provide high protein f to an increasingly larger number of children thr the use of products based on groundnut flour prep from groundnut cakes after extraction of oil and f soyabeans In particular the mid-day meals which at present available to only a small section of sc children should be progressively supplied to all

Family planning programmes must be integrated a programme for health care. Success of family p ning is vitally linked with the spread of educa among women and a rise in their status in our soci

AN APPROPRIATE fiscal policy must keep in n five considerations the people have to ac the burden of higher taxation needed for investm taxation policy must simultaneously aim at redistribu justice and must take into consideration the capa to pay , there is urgent need for simplification rationalisation of the tax administration , taxes n have an in-built growth potential and inherent b yancy ; and taxation policy must aim at stimula growth and must encourage production and savi

The party wants the minimum incomes to steadily so that the difference between the min and the maxima, after tax is reduced to 1 : 20, ultimate objective being to reduce this differentia 1 : 10 The party notes that the government have up a study group but the terms of reference do not pressly cover the question of minimum wage for a cultural labourers and income disparities and lim tion of personal consumption. The party hopes group will take into account claims of social jus

THE PEOPLE have also to be made to realise Mahatma Gandhi taught us, that rights flow out of duties well performed. We will have to pay costs for economic development whether we live democratic society or are governed by dictatorship. only difference is that in a democracy the costs willingly borne ; in a dictatorship, they are extra These costs will have to be paid in the form of work, discipline and integrity.

Unless the nation agrees to defer present consu tion and undertakes large savings and investment e the existing opportunities for expansion canno exploited. The upper classes and elite will have t an example in this regard. Unless these classes giv ostentation and display of wealth, unless they a to make sacrifices proportionate to their wealth responsibility, the common people cannot be ask exercise self-restraint or moderate sectional dem
